Several varieties of hardy Nympheus were exhibited by Messrs, Dr Rothschild, Gunnersbury House, Acton (gr., Mr. J. Hudson). All of them were pretty, and, as far as exhibition in the Drill Hall goes, novel also. First-class Certificates were awarded to N. Robinsoniana, an extremely effective flower, the centre petals being of telling crimson, and the essential organs pale and bronzy yellow. Also to N. Marliacea carnea, a large, handsome blush-white variety.

From F. RECKITT, Esq., Caen Wood Towers, Highgate (gr., Mr. Burt), came a collection of miscellaneous plants, arranged in a pretty group upon the thor—Caladinns and well-grown plants of the usual ornamental foliaged plants were used with good effect (Silver Flora Medal). From the same garden was an excellent plant of Cycas revoluta (Cultural Commendation).

Mr. J. PURNELL, Woodlands, Streatham Hill, showed a group of plants consisting of greenhouse species of a very ellaneous character (Silver Banksian Medal).

Caladiums were shown by Messrs, Jas. Verton & Sons, King's Road, Chelsea, and Messrs. J. Pelli & Son, Norwood Road, West Norwood. Messrs. Vetron had a large group of wellgrown plants, representative of very ornamental and choice varieties, all of which have been described. Messrs, PEED's plants were of smaller size, and were interspersed among a larger number of other foliage plants and Ferns (Silver Banksian Medal).

Hardy flowers were exhibited on this occasion largely by Mr. T. S. Ware, Hale Farm Nurseries, near Tottenham; Messrs. Barr & Sons, King Street, Covent Garden; Messrs. KELWAY & SONS, Messrs, Curbush & Sons, Highgate; and others.

In Messrs Barr's exhibit we noticed many varieties of In Messrs, Barrs exhibit we noticed many varieties of herbaccous Phloxes. Gladiolus, too, in variety were con-spicinous, and there were flowers of Lillium tigrinum, and other species, berbaccous Sunflowers, Pentstemons, &c. An Award of Merit was made to a very fine variety of the lastnamed species, known as President Carnot. The flowers are very large, and purplish-crimson in colour, with a distinct very handsome silvery throat. Jules Sandeaux, Deschanel, and Servadac, are also meritorious varieties (Silver Banksian Medal).

Messrs. Ware's exhibit was a larger one, and contained a number of species of flowers. Herbaceous Phloxes, Lilies, Sumflowers, Pentstemons, Cannas, Dahlias, also a number of spikes of Campanula pyramidalis, Gaillardia hybrida granditlora, was well shown, and there was quite a display of other hardy species. A small group of Isliam philippinense in flower was very noticeable. This is a very graceful Lily, pure white, and has very narrow leaves (Silver-gilt Flora

Medal).

SIR WEETMAN PEARSON, Bart., Paddockhurst, Crawley SIR WEETMAN PEARSON, Bart., Paddockhurst, Crawley (gr., Mr. capp , showed a very creditable collection of hardy flowers. Some double-flowering Hollyhocks were very fine. Raby Castle and other varieties of border Carnations, Coreopsis, and many perennial species, were good (Silver Banksian Medal).

Messrs, W. Curbush & Son, Highgate, N., had a group of hardy flowers, and numerous varieties of Carnations, specimens being first-class of the numerous species (Silver Banksian Medal).

Messrs. Paul & Son, The Old Nurseries, Cheshunt, had a collection of cut flowers, in which an important part was taken by varieties of herbaceous Phlox; bunches of garden and other varieties of Roses were included also, and a few other species of useful hardy flowers. The two fine Cannas, Austria, canary-y llow, and Italia, were also shown (Silver Banksian Medal).

Messrs, H. Cannell & Sons, Swanley, exhibited a group of a very fine strain of a dwarf-growing, variously-coloured Cockscomb (Silver Flora Medal).

The finely-coloured Spirsea Anthony Waterer was shown by Mr. A. Waterer, Knap Hill Nursery, near Woking.

Messrs, J. Cheal & Sons, Lowfield Nurseries, near Crawley,

exhibited about three dozen blooms of Cactus-flowering Pahlias. Many of the varieties were bright and meritorious. Also a collection of ornamental Crabs (Eronze Banksian Medal).

Messrs. Kelway & Son, of the Langport Nurseries, set up an excellent collection of cut spikes of Gladioli, in which were 160 spikes, several of them illustrating the dark-shaded crimson forms we have seen during the last year or two, and

some of them with gigantic blossoms, showing the blood of the Lemoinei and Nanceianus sections. This collection afforded a good opportunity to make a selection, only that all were good that a selection of, say, a dozen varieties was a little difficult. Awards of Merit were made to Carlyle, a mignificent hybrid, the flowers brilliant red, that portion of the throat represented by the lower petals being pale, punctured with small dark spots—a superb new form; to Baxter, crimson, heavily suffused with purple, and flaked on the edges of the stout and finely-formed petals with marcon—a variety of high quality; and to Penn, a type remarkable for the large size of its individual blossoms and superb spike, the colour bright curmine, the throat flamed with violet-purple. In addition, there were other deep crimson forms, some brighter than others, some with lively purple shades-Fortal, Dryden, Clive, and others. Then of others of th type with which we are more familiar, there were Darwin, thoyand, Chancer (cream with yellow throat), Keinble (a beautiful light variety), Rev. II II, D'Ombran, Buroness Burdett Coutts, and Buron Schroeler. Older varieties, but still very fine Alaine, W. H. Fowler, &c.

Mr. W. Buin, gr. to Sir TRLYOR LAWRENCE, Bart , Burford Lodge, Dorking, set up a very interesting collection of Ghalioli, comprising, first, some of the newer forms of Lemodne's hybrids, such as Jules Deville, purple; Gumbetta, marcon-crimson; Etoile d'Or, Sceptre d'Or, and L'Enfant de Lorraine, all very pleasing shades of yellow, more or less handsomely in irked on the throat. Of the Nanceianus type, thandsonery in tract of the characteristic specific president Carnot, very fine; Abbé Frowerit, President Chandon, Emile Anger, yellow; W. Watson, very large, and singularly novel in the colouring, but the petals were too thin in substance to stand outdoor exposure; and Lamartine. Of the new American hybrids, some of which are very fine, Childsii, brilliant searlet, white turoat; Mrs. Beecher, Ben Hirr, Fatma, and Dr. Sellow.

Messrs. VEITCH & Sons, Exotic Nurseries, Chelsea, also Massis, Valled & 2008, Petal with states of Lemonnei and Nanccianus Gladioli, such as Dend de Carnot, brilliant crim-son ground, heavily flaked and shaded with maroon Award of Merit); Sénateur Pollard, pale purple or violet upper petals, the lower petals stained with a deeper tint, the throat cream and black (Award of Merit); Sophie Buchner, pale yellow; Amiral Gorvan, Paul Hariot, purple; Pretote, deep yellow, small, but of fine form; Rev. W. Wilks. Dominie, rose; and A. K. Kruber

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs. Jas. O'Brien (hon. sec.), H. M. Pollett, H. Ballantine, H. J. Chapman, T. W. Bond, Dr. M. T. Masters, E. Hill, E. Ashworth, W. Cohb, W. H. Protheroe, S. Courtauld, T. B. Haywood, J. Jaques, and A. H. Smee.

Although Orchids were not represented in great quantity, a few really fine exhibits were staged. Of these the Cat tleya x Hardyana splendens, exhibited by Baron Sir H SCHRODER, The Dell, Egham (gr., Mr. H. Billautine) was, viewed from all points, the finest variety of this showy and delightfully fragrant natural hybrid Cattleya vet exhibited. The gorgeous dark purple-crimson, gold-veined labellum, cemed exactly like that of a fine variety of Cattleya aurea Dowiana, while the rose-tinted sepals and petals were like those of C. Warscewiczii (gigas). The plant, which was also a fine example of good culture, secured a First-class Certi ficate. Baron Schroder also showed fine cut examples of Lælio-Cattleya × Sedeni (L.-C elegans × C, superba); L.-C, x elegans, Veitch's variety, in which the whole flower is very richly coloured, the side labes of the labellum unusually dark; and the rare L.-C. x elegans Morreniana.

R. I MEASURES, Esq., Cambridge Lodge, Camberwell (gr., Mr. H. J. Chapman), staged a very pretty and interesting group of Orchids, in which the showy things and those of rare botanical interest were well balanced. Among the most noteworthy things in this group were a fine variety of the pretty orange-scarlet Ledia monophylla, the rare and singular Plearethallis scapha, with a graceful raceme of long white and rose flowers, a fine specimen of Cypripedium × cenathum, C. × Clinkaberryanum, C. Godefroyæ, C. × Chas. Canham, C. × Lachmee, C. × grande; a pretty plant Chas. Canhain, C. × Lachmee, C. × grande; a pretty plant of the dwarf Oncidium longipes, Cattleya Warscewiczli, and other showry Cattleyas; Phalenopsis Schroderi, Lælio-Cattleya Schilleriana, a mumber of varieties of Masslevallia Harryana, M. × Stella, M. × Barkeana, M. amabdis, M. anchorifera (Botanical Certificate); M. guttulata, M. Reichenbachiana, M. chimera, &c. (Bronze Lanksian Medal)

Sir FREDERICK WIGAN, Clare Lawn, East Sheen (gr. Mr. W. H. Young), showed Laelio-Cattleya × elegans Cawenbergiana, a very distinct large light rose purple coloured form, with the base, and parts of the side lobes of the lip clear white. The inforescence bore nine fine flowers, and the variety received an Award of Merit. Sir Frederick Widay also showed a ten-flowered inforescence of another fine form of Lacho-Cattleya - elegans of the "Turneri" class, taken from a plant bearing twenty-nine flowers.

Messrs, F. SANDER & Co., St. Albans, staged an effective group, in which the principal novelty was Cypripedium Excelsior var. Mars (Harrisianum - Rothschildianum), a fine the long petals green at the base, spotted with chocolate-brown, and tipped with rose, and the face of the labellum bright reddish-brown (Award of Merit); also in Messrs, Sanders' group were two plants of Sobralia xantholeuca, the protty Trichopalia brevis, Cattleya eldorado Wallisii, Lælio-

Cattleya × elegans Turneri, Polystachya Leonensis, Phains Humbleth, Spathoglottis plicat i Micholitzii, Miltonia vexil-luriu, Eria acervata, Dendrobium bracteosum

ELIJAH ASHWORFH, Esq., Harefield Hall, Wilmslow. Cheshire (gr., Mr. Holbrock), seut Cattleya Giskelli mi dbi magniflora, perhaps the finest pure white form of Cattleya labiata yet seen, its flower being extraordinary in size, fine in shape, and of a pure white; also the rare and paetty Kienastiana (C. Luddemanniana x C. aurea) Cattlega .

Sir WILLIAM MARRIOTT, Down House, Blandford, showed Cittleya & Morriotte (Elborado & Warseewiezii), a very pretty hybrid, with a general resemblance to C. Eldorab splendens, but with all the segments broader. The plant bore a fine five-flowered inflorescence,

C. L. N. INGRAM, Esq., Elstead House, Goddlining (gr., Mr T W B-nd), showed Ledio-Cattleya - Seraph (L.C) - clogans × C, citring, a remarkable and pretty hybrid, although not as yet showing so much of the influence of C, citring as might be expected. The plant was dwarf, and the pseudo-bulbs curiously swollen in the middle. The flower was home erect, and partook of L.-C. elegans in form, but was smaller, and more compact, and the segments broader in proportion to their length. The sepals and petals were light yellow, slightly tinge I with green, and the front lobe of the lip crimson purple (Award of Merit

REGINALD YOUNG, Esp., Fringilla, Linnet Lune, Seiton Park, Liverpool, sent out examples of Lediterispa Buchaniana, Cattleya velutma, Ladio-Cattleya - elegans Turneri, and L. C. 8, clerans Houtteana.

A. H. Million, Esq., White Ludies Road, Clifton, showed a six-flowered inflorescence of Cattleya Loddigesii, and a striped form of Cattleya labiata Gaskellian (

PANTIA RALLI, Esq., Ashstead Park, sent cut examples of a pretty, small-flowered, crimson-purple Sobralia, allied to 8 Lowii, and of Odontoglossum aspidorhimum, Ralli's variety, a remarkably pretty flower, and the best of this curious and elegant species yet shown. The sepals and pet ds are yellow, with bright red-brown spots, the large fringed lip evenly spotted with rosy crimson. The bristles at the base of the labellum, which are characteristic of the species. were also highly developed in this fine variety.

A. Singulion, Esq., Chapel-en-le-Frith, sent Cypripedium

Singletomanum vexillarium × barbatum Warneri), and a spake of Lolia crispa.

Fruit Committee.

Present; Philip Crowley, Esq., in the chair; and Messrs. R. Hogg, Geo. Bunyard, A. F. Barron, Jos. Cheal, A. H. Pearson, J. Wright, Alex. Dean, J. Willard, J. W. Bates, Jas, H. Veitch, G. H. Sage, Robert Fife, and G. W. Cummins.

The Λ_{PP} awarded 1st prize in the Veitchian competition, for the best dessert sorts, was Irish Peach, exhibited by Mr. Over Thouas, Royal Gardens, Froguere. Red Astrachan was placed 2nd, as shown by Cotville Brown, Esq.. Hextable, Swanley Junction. Summer Queen, Worcester Pearmain, and American Nonsuch were also shown.

Only one Pear was staged, viz., Jargonelle by Mr. O. Thomas, and it was awarded 2nd prize.

Mr. J.vs. Nash, Belvedere Nursery, Wimbledon, exhibited four dishes of Victoria Nectarines; and Mr. D. DAVIES, Amberley Court, Strond (gr., Mr. Butcher), had a dish of

Princess of Wales Peaches.

Sprays of Wincherries (Rubus phenicolasius) were sent by Mr. W. BATCHELOR, Harefield Park Gardens, Unbridge, Mr. BATCHELOR had also a dish of Runner Bean, Sutton's Best of All.

An Award of Merit was given to a Melon, Harris' Favourite. exhibited by Phillie Crowdery, Esq., Croydon (gr., Mr. J. Harris). It is a searlet-fleshed variety, and has strav-coloured exterior, closely netted. The flesh is deep and the the committee.

Mesers, Geo. Bunyard & Co. Maidstone, exhibited about

forty dishes of fruit consisting for the greater part of Apples, but including a few Pears. Awards of Merit were recom-mended to Pear Aspasie Aucourt, and Apple Cardinal Peter the Great), both of them in this collection. The Apple has been known for several years under both of the names given above. In appearance it is not unlike Duchess of oldenburgh in regard to the red streaking, but they are less deep than in the Duchess. It is a good flavour, useful for the table or for the kitchen. The Pear is a green-fruited variety, passing to yellow, and is ripe in August. Many varieties of Apples and Pears were exhibited in fine condition

The following were noticeable among them. All the fruits were taken from pyramid trees out-of-doors; Early Green Gage, Early Transparent Gage, Jefferson, Liwson's Golden Gige Washington, Boddert's Gige, and of purple or black-fruited varieties, Froginore Orleans, Kirkes. Bille de Louvaine, Prince Engelbert, De Montfort, Augelin i Burdett, Louvaine, Prince Engelorit, De Montolit, Magellit Cherica, and Czar; Victoria was shown well. This exhibit also included Morello Cherries, Negro Largo Figs, Lady Sudely Apples; Pears, Williams' Bon Chrotien, and Doctor Jules Guyot, and spray of Wineberries (Silver Bankstan Medal).

A seedling variety of Uncumber, known as Palmer's Graceful, was exhibited by Mr. W. Parmur, Andover, Hungshire. The specimens were very commendable, but there was not occasion for an award.

Some large Potato tubers were sent from Mr. Kempshall.

Lamport Hall Gardens, North unpton,

Mr. Druery's Lecture.

In the afternoon Mr. Chas. T. DRUIRY, F L.S , gave a very interestinglee ure (Dr. MAXWELL MASTERS, F.R.S., in the chair) on "Fern Generation, Normal and Abnormal," a subject of which he has made a special study, and which he illustrated by means of numerous lantern slides, depicting the various phases of devolopment from spore to plants. Starting with a brief description of the difference between a spore and a seed, the one a simple vegetative cell protected by a shell, the other a complex body, the result of fertilisation by pollen, he showed how the first results of germination also differed fundamentally. The spore in Ferns took the form of a small green scale, or prothallus, on the undowing of which the form contact the first results of the form of the fo underside of which the flower-conivalents were developed; furtilisation took place, and practically a seed produced from which the Fern as w: known it arose. The phenomena attending this were shown on the screen from a series of diagrams by the lecturer, finishing by a slide of young Ferns themselves, and then by a reproduction of Count Suminsky's splendid series of plates which accompanied the publication his original discovery in 1844 of the complete cycle of Fern life. Having thus treated of the normal or usual method of reproduction, Mr. DRUERY proceeded to describe Professor Farnow's discovery of apogamy, in which the Fern was p oduced upon the prothallos by non-sexual hudding, showing that the process of fertilisation was not an absolute essential to the continuance of a species. A recent case of a diffe ent form of apogamy was cite; in which ordinary buds were developed on horn-like extensions of the prothallus. The various types of buds or bulbils formed on the fronds of Ferns were then illustrated, the curious dorsal bulbils sometimes associated with the spores on some Lady Ferns being especially dealt with as leading up to another abnormal mode of reproduction first noted by the lecturer, termed apospory, in which the Fern does not produce spores, but develops the prothallus either on the backs of the frond, where spores should be, or more remarkably still from the points of the frond segments. This phenomenon had been observed in four British species and the lecturer exhibited a plant in which one of the froods was literally fringed with prothalli, while the backs bore heaps of the incipient growths of the other kind or dorsal apospory.

Mr. DRUERY then proceeded to deal with the varietal aspects of Fern reproduction, throwing photographs on the screen of two remarkable instances of success in selective

culture in a few generations; the pedigree being shown, and the immense strides taken clearly exemplified. Finally, he alluded to the possibilities of hybridisation and crossing, not merely between varieties and subspecies, but setually between widely divided specific forms. Schneider's success in Polypodium Schneideri was cited, and others of more recent accomplishment by the same listed; in which the peculiarly beautiful character of our British forms had been unmistakably introduced into large growing exotic Mr. E. J. Lowe's successes in the crossing of Hartstongues were also commented upon.

THE BRITISH PTERIDOLOGICAL.

AUGUST 3.-As usual on the August Bank Holiday, a goodly number of lovers of our native Ferns assembled in the Lake District, this time at Bowness, Windermere, to discuss the most recent varietal developments, and to read papers bearing upon the cult under its several aspects. The Institute at Bowness was the meeting place, and after the usual routine business had been transacted, Mr. Chas. T. Drnory read a paper on the "Marvellous Side of Fern Life," Dr. Stansfield following it with another on "Weismann's Theory of Heredity as Applied to Ferns." Curiously enough, without any prearrangement, the two papers formed a continuous history of the cell and its development; Dr. Stanfield's dealing with the process of fertilisation of the egg-cell, and illustrating by diagrams how this cell prepares itself for the process by throwing off and out a part of its nucleus, which is subsequently replaced by contact with the antherozoid. A very interesting point bearing on Mr, E J. Lowe's theory of multiple parentage in Ferns, was hereby demonstrated, namely, that this process is effected by such an exact adaptation of part to part, that there is absolutely no room for the introduction of multiple influence in the sense of multipaternity. To use a commonplace illustration, the nucleus to be fertilised is like a pill-box, the lid of which is thrown away prior to fertilisation, the result of which is the addition of a fresh lid, after which the box or cell divides and multiplies itself on a regular plan. Just as a second hd could not find a place, so would a second antherozoid find itself de trop. In Mr. Druery's paper the cell was compared to a patent brick which multiplied itself ad libitam, and built itself up into complicated structures, planned with marvellous foresight and ingenuity to accommodate a self-generated community of ladies and gentlemen (archegonia and antheridia), the latter of which were furnished with bicycles (edia: to visit their stay-at home lady-loves. This community then passes away, and behold! a wonderful structure arises-the primary frond—and in time a stately Fern is seen, built up on unnecessarily complicated lines, and culminating in a shower of millions of "bricks" or cells, all capable of performing the same miracle as the original brick we started with

The papers read were discussed at some length. A considerable number of fronds were exhibited for judicial opinion and naming. A very beautiful and dense plumose Athyrium, found in Ireland, was shown by Mr. Phillips, of Beifast, together with a neatly tasselled Shield Fern of peculiar symmetry.

Mr. Druery showed a number of fronds of his plumose Lively Ferns, which were much admired, some six or seven distinct forms of rare beauty being exhibited. The "sensidistinct forms of rare beauty being exhibited tion" of the meeting was, owever, a form of Listrea nontana (the lemon scented Buckler Fern), raised by Mr. Wiper, the treasurer, from a find of his own. In this art wiper, the treasurer, from a find of his own. In this extraordinary plant o which a number appeared in the sowing), the front has very finely ent pinnules, differing greatly from the normal, from the point of each of which the midrib extends for neurly an inch as a delicate filament. These theads throughout a reason of the filament. These threads throughout some of the fronds terminated in tiny tassels, the whole combination being extremely pretty. The plants were young and small, though rob ist; there is, therefore, every probability that, as adults, they will rank with the most remurkable, as well as more beautiful Ferns in existence. It is a new and unpuralleled "break," as charming as unexpected.

A vote of thanks to the officers, the President, and Mr. Druery for their services and papers, and highly satisfactory reports from Secretary and Treasurer as to the progress and

unds of the Society, completed the proceedings.

The Secretary of the Society is Mr. Geo. Wintwell, Serpentine Cottage, Kendul; the subscription is small, and the Society, as a means of bringing together, at least once a year, a body of British Fern- ers nerits the hearty support of all admirers of these beautiful native plants in their varietal forms. Chas. T. Douery, F.L.S.

HORTICULTURAL SHOW AT LEICESTER.

August 4.-This annual exhibition is managed by the Parks Committee of the Leicester Municipal Conneil, the Secretary being Mr. JOHN BURN, the Curator of the Abbey Park. Five large tents were required to accommo 'ate the exhibits, the cut flowers especially being very numerous. Each year the show increases in extent and quality, and it is probable that another year the show will be continued for two days. Specimen plants were decidedly better than we had before seen them at Leicester, and the groups of plants also.

The best group, filling a space 100 feet, was a circular one, and came from Mr. C. J. Mer. Nottinghum; in the centre was a cone formed of Caladiums, Crotons, Ferns, &c. surmounted by handsome specimen plants, from which radiated lines having at their extremities pretty dot-plants, the ground-work lightly filled with various small plants, contrast and harmony uniting to furnish a very effective arrangement.

Mr. BLAKEWAY was 1st with six stove and greenhouse dants, having good examples of Croton's Queen Tictoria and Majestic, a fine Allamanda Hendersoni, Phoenix reclimata, Ixora Frascri, and Statice profusa.

Some fine specimen exotic Ferns were steged. Mr. C. J. MEE was 1st, and Mr. Binson 2nd, but both unnamed; indeed, but few of the plants in the exhibition were named, thus depriving the public of becoming acquainted with the

plants they may admire.

Tuberous-rooted Beginnias were a good feature, the 1st prize for six sin (le-flowere l varieties of the tuberous section going to Mr. JAMES WRIGHT, nurserym in, Leicester, who had admirably grown and flowered plants of good quality; Mr. If Roomer being 2nd. The best six double varieties came from Mr B. R. Davis, nurseryman, Yeovil, who had some excellent specimens.

Coleus were present in the form of attractive bushes, well grown and coloured. Mr. 11, Rogers was 1st.

Fuchsias were medium-sized bush specimens, well bloomed. The best four were staged by Mr. H. ROGERS.

Table plants contained nothing of a novel character.

Zonal Pelargoniums, excellent in growth and bloom, afforded striking patches of colour. Mr. H. Reams was 1st with six, and Mr. Jas. Warour 2nd; and these two exhibitors were 1st and 2nd in the same order with six doubleflowered specimens. Plants were also shown by amiteurs and cottagers, and their contributions filled a large tent.

and cottagers, and their contributions filed a large tent.

Cut Flowers.—Roses were both extensively and well shown, the northern growers hang in strong force. There were four collections of thirty-six varieties, single blooms. Messrs.

James Cocker & Sons, Aberdeen, were placed 1st, with grand blooms of Marie Baimann, Horace Vernet, J. S. Mill, Earl of Dufferin, François Michelon, Madame Hoste, Prince Arthur, Due do Roben, Galden Care, Dr. Vole, Gameral Arthur, Due de Rohan Golden Gate, Dr. Andy, General Jacqueninot, Mulame de Watteville, Captain Haywood, Chopatra, Charles I, febvre, &c : 2nd, Messrs, D. & Cholle, Dundee; 3rd, Messrs, Harkness & Sons, Beddle.

With twenty four varieties, Messrs, Cooker & Son were again 1st, having in fine character Marie Baumann, Louis Van Houte, Mrs. J. Lung, Horace Vernet, Day de Rohan, Madame Hoste, A. K. Williams, Denmirk, Aug. Rigotard, &c.

With twelve Teas and Noisettes, Messrs, James Cocker & Son

The best twelve blooms of any one variety were of Mrs. J. Ling from Messrs. D. & W. CROLL; Messrs Jis Cocker & Sons were 2nd, with Mirie Buimann.

In the amateurs' division for twenty-four blooms, The Ray, J. H. PEMBERION, Havering, Romford, was 1st, having Madame Joseph Bonnaire, Horace Vernet, Mrs. John Luing, Charles Lefebvre, Duchess of Bedford, A. K. Williams, Comte Rainbaud, Victor Hugo, Charles Darwin, &c.; Mr. H. V.

Machin, Worksop, was 2nd.

Mr. Machin had the best eighteen varieties, The Rev. J. ff. PEWBERTON taking the 2nd prize; while in the class for twelve varieties, Mr. Machin and Mr. Pemberton were placed equal 1st. Mr. Machin and Mr. Pemberton were placed equal 1st. Mr. Machin had the best six Tens and Noisettes, his four best blooms being Maman Cochet, Ernest Metz, Catherine Mermet, and Madame Hoste; Mr. Pemberton was 2nd. Mr. Pemberton had the best six of any one variety in Charles Lefebyre; Messrs. Machin and H. Rogers taking the 2nd and 3rd prizes, both with Mrs. J. Laing.

tuberous-rooted Begonias, either double or single, are not effective, however good their quality, when dumped down on moss in hoxes, and some better method of showing them is necessary. Messrs. D. & W. CROLL's single varieties were bold and striking.

Carnations and Picotees are always a good feature at Lei-

cester, and the popular interest in them was shown by the crowded tables whereon they were staged. Mr. M. Camp-BELL, florist, Blantyre, had the hest twelve white-ground Carnations, showing full well-marked varieties; Mr. A. R. Brown, Handsworth, Birmingham, was 2nd; and they hed similar positions with twelve Picotees. With twelve yellowground, self or fancy, Mr. BROWN was 1st, having ver blooms of Monarch, Romulus, Mrs. A. Tate, Cardinal Wolsey, Ludas, and Mrs. Douglas, six excellent varieties; Mr. M. CAMPBELL Was 2nd. Carnations and Picotees were also shown as single blooms in several classes, and a good many

collections of six bunches were staged,
Mr. M. Campbell was 1st with twenty-four, and also with twelve blooms of Luncy Pansies, having blooms of fine development. Mr. Campbell, also had the best twelve bunches of Violas, set up in handsome sprays.

FRUIT AND VEGETABLES

There were three entries of a collection of eight distinct varieties, the 1st prize going to Mr. J. H. GOODACHE, The Gardens, Elvaston Castle, Derby, who had finely-finished Black Hamburgh and Gros Maroc Grapes; Muscat of Alexandria, long in the banch, but lacking colour; a very fine Queen Pine, Royal George Peach and Pine-apple, Neetavines, Negro Lago Figs, and Cashmere Melon; Mr. A. McCulloch gr. to W. J. Webb, Esq., Newstead Abbey, Notts, was 2nd.

There were three collections of four dishes, Mr. J. H.

GOODAGRE being 1st, with long, tapering, well-coloured bunches of Muscat of Alexandria Grapes, Bellegarde Peach, Spencer Nectarine, and Countess Melon; 2nd, Mr. A. McCullocal

The best Pine-apple was an excellent Queen, from Mr. C. J. MEE. Nottingham.

With two bunches of Black Hamburgh Grapes, Mr. McKisnish was 1st, his being good in berry and bunch; 2nd, Mr. Shaw, gr. to R L. Tooth, Esq., Gar Loughbore'; and Mr. A. McCulloui was 3rd. Garrenden Park,

The best two bunches of Museat of Alexandria Grapes came from Mr. McKinnish; Mr. Goodacre was 2nd. Any other black Grape was represented by two bunches of Madresfield Court, from Mr. McCullocn.

With two bunches of white Grapes, other than Muscat, Mr. J. H. GOODACRE was 1st with capital Foster's Seedling; Mr. Jas. Revie. Burton-on-Trent, was 2nd, with Mrs. Pearsun, very good.

The best dish of Peaches was Bellegarde, from Mr. John Wallis, The Gardens, Keele Hall; Mr. H. Blakeway was 2nd, with Royal George.

Mr. JOHN READ had the best dish of Nectarines; Mr.

GOODACRE being 2nd Figs, Morello Cherries, Currants, and Gooseberries were also shown.

The best dish of dessert Apples was Beauty of Bith, from Mr. GARAWAY: Mr. W. EMERTON, Buckingham, was 2nd,

with Quarrenden. The best dessert Plum was Transparent Gage, from Mr

JOHN WALLIS; Mr. GOODACRE 2nd, with De Montfort.
Mr. A. GEARY was 1st for Tomatos, with a fine dish of the Perfection type; Mr. J. H. GOODAURE 2nd, with Ham Green Envourite.

There were three collections of vegetanes compound to Messrs, Surron & Sons' special Prizes. Mr. A. McKinnish was 1st, with a very fine lot—Onions, Tomatos, Satisfaction Potatos, Runner Beans, and Celery, being especially good. With six dishes, Mr. W. Burrow was 1st, being the only There were three collections of vegetables competing for

exhibitor, but having some finely grown samples. With ten varieties, Mr. W. Berrow was again 1st, having Cauliflowers, Runner Beans, Potatos, Onions, Tomatos, &c., in fine character,

In competition for the special prizes offered by Mr. Charles WARNER for unlimited dishes; Mr. J. Green was 1st. Cauli-flowers, Turnips, Carrots, Onions, &c., were in fine character as single dishes. Messrs, Yarde & Co., Northampton, also offered special prizes for eight dishes. Mr. Tuos. E. Poxon, Lockington, was 1st, and Mr. W. EMERTON 2nd Autumn Onions were very fine, also Broad and Runner Beans. Potatos, shown in collections of six dishes were good. Vegetable Marrows appeared rather old, but Cucumbers good.

HONORARY EXHIBITS.

Prominent among these was a splendid group of Caladiums from Messrs. J. Peen & Sone, Roupell Park Nurseries, Lower Norwood, London. Silver Medals were awarded to Messrs, Edwards & Son, Sherwood, for Foins; Messrs, Clarkan & Son, Oldfield Nurseries, Altrincham, for cut flowers and small table plants, Dahlias, Asters, &c.; to Mr Henry Rogges for a collection mainly of foliage plants; to Messrs. YARDE & Co. for the same; Messrs. PEARSON & Son, Chilwell Nurseries, Notts, for a striking collection of very fine cut zonal Pelargoniums; Mr. C. J. Ecles for Ferns; Messrs. Harrison & Son, Leicoster, for a collection of farm and garden produce; and Bronze Medals to Messrs. W. & J. Brown, Stamford, for various cut flowers; Messrs. Carler & Co., High Holborn, for the same; and Mr. B. R. Davis, for a large grown formed of Begonia blooms.

DAVIS, for a large crown formed of Begonia blooms.

A special prize was awarded to Messrs. B. S. Williams & Son, Victoria Nurseries, Holloway, for a very interesting collection of new and choice plants.

ROYAL SCOTTISH ARBORICULTURAL.

On August 4 the members of this society left Edinburgh by an early train for Stirling, where they were met by a number of members from east, west, and north of Scotland. Enthusiasm was exceedingly high when the "jolly foresters" drove off in brakes to visit some of Scotland's most beautiful scenery, rendered popular by the minute details pour, trayed in Scott's Lady of the Lake, Rob Roy, &c. Tourists from all parts of the world have visited these districts, and have admired the unique pictures of nature there to be seen. The first place of visit was

AIRTHREY CASTLE,

the beautiful seat of Donald Graham, Esq. Entering by the main lodge, and passing along the beautiful drive, some fine Beeches are seen, between the trunks of which the lake visibly glitters with excellent effect. The park throughout is rich in landscape beauty, but when seen from the bills north of the castle the picture is truly charming. By a steep walk one is led to the Hermitage (some buildings that are said to have been the cave of a hermit), 400 feet above the ground level. From this point views in which Stirling Castle, Abbey Craig, with the Wallace Monument on the top, and adjacent seats rich in arboricultural interest are most attractive. The empany had too little time at their disposal, otherwise the gardens now in such high class condition under the management of Mr. Retherrord, the gardener, were to have been visited. Muscat and Black Hamburgh Grapes here are said, by capital judges, to be second to none in Scotland, plants, vegetables, and hardy herbaceous plants are also leading features in the gardens at Airthrey. The best thanks of the visitors were expressed to Mr. Graham, and the courtesy of Mr. Dempster, factor, Mr. Merrard, forester, and Mr. Rutherford, gardener, was acknowledged. Onward to

KEIR

was then the order of the indefatigable leader, Mr. Matcolm Duns, Dalkeith. The whistle sounded, and soon the hundred or more members were being driven westward to the fine seat of Archibald Stirling. Ess. The grounds are entered by a fine avenue of Limes, and passing onward toward the spacious mansion there is seen a wealth of trees and shrubs, some of them representing the choicest species, in addition to the great number of honely Scotch Fir, Beech, Oak, Ash, and others. Many of the latter are handsome specimens of large dimensions. The visitors spent their limited time in the pleasure-grounds among the multitude of trees and shrubs. The 9 miles of evergreen hedges, hundreds of clipped Yews, the "battlements" near to the mansion, consisting of Yews, &c., cut into forms representing defensive and offensive mesonry; long lines of Golden Holly hedges, and choice specimens of Conifere, give a very diversified picture to this grand old place. A famous old Spanish Chestnut, with huge limbs widely spread, and kept together by bands and chains, was an object of special interest. The old Monarch was measured at 6 feet from the ground; the girth of trunk is 26 feet. A handsome Larch, with clean stem, measured 12 feet 9 inches, and is 75 feet high, with branches spreading outward, and in a somewhat peculiar fashion. Cupressus sempervirens, like pillars round the walls of the mansion, are objects which were closely inspected; some fine trees of Abics grandis and Codrus Deodora were also admired. In some parts of the grounds many gross-growing herbaceous plants have been planted with exceeding care, to suggest natural wildness.

Most of the company expressing a wish to see the gardens were conducted through them by Mr. Lunt, the well-known gardener. Much has been done of late years in the various departments to improve them. By careful degrees new fruit-houses are taking the place of old ones. The young Vines look very promising, and others in boxes are doing good service in maintaining serviceable crops until the permanent Vines are established. The plant-houses were never better filled than at present. Palms, splendid Crotons, Caladiums, Ferns, and New Holland plants are among the specialties, and some of them are well remembered—have been frequently prize-winners at the northern exhibitions. The homestead on the farm was another object of interest, for all that pertained to beauty or usefulness was liberally encouraged by the late Sir Wa. Striking Maxwell. The issual votes of thanks were passed by acclamatio.

DOUNE CASTLE

was the next place of interest. It is the property of Earl Moray, and is visited by a great number of tourists. Its historical associations renders bonne one of the most interesting ruins in Scotland. The massive masonry is surrounded by wide, grassy, undulating ground, upon which large spreading trees of Ash, Oak, Beech, &c., grow as isolated specimens. Though Lord Moray regretted he could not be present, his lordship endeavoured to make amends by the provision of a substantial lunchern. The thanks of the

eompany was strongly evinced in the toast of his lordship's health. Mr. McLachlan, the factor, was also specially thanked. The party then drove off to—

BLAIR DRUMMOND.

They were cordially received by Mr. Ballingall, Colonel Home-Drumonn's factor. This is a splendid domain, containing many grand trees, some of them standing singly in prominent positions, displaying their stately outlines to advantage. The arborists had an enjoyable time calculating, measuring, and commenting upon the specimens. Becches and Oaks are particularly fine. One Beech tree is 16 feet, another 18 feet, in circumference. An Oak has a clean stem of 25 feet, is over a 100 feet high, and has a girth of 16 feet 10 inches. A Sycamore, possessing a splendid head of branches, measured 19 feet 6 inches in girth; a Beech tree, close by, is 15 feet 3 inches, and a black Italian Poplar is 14 feet 7 inches in girth. There are some handsome Spanish Chestnuts and fine Larches in this spacious park. Many of the visitors regretted that time would not allow of a visit to the gardons. Thanks were expressed, and steps were again taken to the brakes, which in a short time took us to—

LANRICK CASTLE,

the seat of Sir R. Fardine. It is such an one as any proprietor might be proud of. The undulations, long glades of finely-kept grass, the cle m smooth walks, cheery running stream, are all indications of good taste and above of order. Tsuga Mertensiana in fine groups are be utiful in outline, and in robust health; Mr. Br.o., the gardener, raised them from seed brought from America in 1861. Some of the heights, from measurement, are 67, 65, and 62 feet; h_1^2 , h_2^2 , and 4 feet 10 inches in girth 4 feet up the stems. The specimens were feathered to the ground Some splendid trees of Cupressus Lawsoniana and Douglas Firs were admired. Many fine trees were destroyed here by the storm of 1893. In the well-kept gardens—extensive bedding, capitally done, was noted—especially the Begonias, whilch are as fine as may be seen anywhere. The vegetable garden is particularly well managed here. The company was supplied with a sumptuous tea, and a refreshment peculiarly grateful to Scotsmen. The party was, therefore, in capital order for their journey to Callander, but thanks were first given to Sir Robert and his contreous staff. At 730

THE ANNUAL DINNER

was held in the spacious "Dreadmought" Hotel, Callander, Professor Bayley Bayley hat so the in the chair, and Mr. Dunn vice-chairman. After the loyal toasts were homoured, that of the Society was proposed by the chairman, when the Professor insisted on the desirability of the Government establishing a forest area where the best inition could be acquired, and the best systems of forestry could be demonstrated. Professor Sounce race, who was the distinguished guest of the society, replying, expressed his admiration of the magnificent parks and trees which he had seen; but his opinion is, that forestry should be carried at on-different principles than he had seen in Scotland, me using that it was of great importance to enter now thoroughly into commercial forestry. Such, of course, may be done on waste and inferior hand, but should not be allowed to encroach on our fine pastoral land. The Professor had won the good opinion of many of the company at the Royal Botanic Garden on the day previous. An early start the following morning (Wednesdey) was made for—

ON THE WAY TO BUYHANAN CASTLE,

the princely seat of the Duke of Monthose. The clear air blue canopy overhead, bright sunshine, and bracing highland breezes, seemed to fill the whole company with vigour after the hard day's work on the Tue-day. The journey westward was in every respect delightful. The Trossachs, ruber in poetical lore and romantic seenery than arboreal interest, were soon reached.

> "Wondrous wild the whole might seem, The scenery of a farry dream,"

It would appear that in the portions clothed with trees, generally Hazel, that the roots must be of great antiquity. The stocks seem to have sent up suckers from time to time as the tops have decayed. The passage up Loch Katrine, in swift, light steamboats, was almost beyond description; every forester was in the best of humour, and never was the beauty of a scene more vivid. Ellen's lsle was eagerly scanned to note the trees growing thereon- much cannot be expected "on shingles dry," but a variety of shades of colour in the foliage gives the picture a peculiar beauty. The scenery, changing at every turn, created something like excitement among the admiring passengers. Coaches were waiting at Stronachlachar pier, which were soon loaded and despatched to Inver-smald, Rob Roy's country. A steamer was soon conveying snand, non noy's country. A steamer was soon conveying the party down Loch Lomond. Singing was now indulged in to relieve our pent-up feelings; the sound of "The Bonny Banks of Loch Lomond," sung trom 100 or more voices, must have been heard far inland, and would ascend over Ben Lonnord itself! No doubt the genial German professor thought these Scotsmen "africhaps;" he soon afterwards took farewell of the party. Then the singing of "Auld Lang Syne," with "Here's a hand, my trusty friend "in demonstrative fushion will no dould be long remembered by the German savant, who went northward, accompanied by Prof. BALFOUR to inspect the commercial forestry of the northern districts of Scotland Landing at Balmaha, many of the party crossed in boats to the Island of Inch Cailloch, where many stirring stories of fiction have had their foundation. Two high peaks in the island are covered with Scotch Firstother parts have dotted about in favoured spots thriving

Oaks, Larches, Birches, and Hazels. The burying ground of the MACGREGORS is still marked by a crumbling stone and lime. Returning to the mainland the company were much interested in the Pyroligneous Acid Works of Messrs. Turnsbull & Co., Glasgow, which have been established over 100 years: a chemical factory distilling the most unlikely portions of wood, which is cut from Oak coppless, into pyroligneous acid which when purified by lime gives wood spirit, and this is used in the manufacture of mothylated spirits.

After a careful inspection the company were entertained by Mr. Turnauel, who gave a samptuous entertainment, which was heartly partaken of. After thanking the gentleman for his kindness, the party drove to—

BUCHANAN.

where Mr MURRAY, factor, and Mr. McCullum, forester, acted as guides through the beautiful park and woods. An inspection of the home nursery was made, which is Many Oaks well filled with forest trees in capital health. and Beeches were passed in the plantations; Spanish Chestnuts were fine. A plantation of eight acres or more of Boughas Firs was seen. This is a grand feature—with an outline of graceful branches of glaucous hue, and trees an outline of goaceful branches of glaucous hue, and trees 75 feet high, and girths of trunks averaging 6 to 64 feet — is an imposing feature on this truly ducal domain. In the Park = 0.48s, Ash, and Sycamores, dotted irregularly, have a charming effect. Fine Larches measured over to feet in girth of trunk, clean stems 30 feet or more high, and 75 feet in height to the top. Many fine Honglas Firs were seen in the ordinary woods, large and vices as Wellinstein, were noted. Thuis giguiter and vigorous. Wellingtonias were noted; Thuia gigantea, and other choice Conifere, were passed. One Douglas Fir measured 12 feet 7 inches in girth, and had a height of 90 fe t; a fine spreading Yew, with a trunk 12 feet in girth; an Oak, close by, with fine stem 17 feet in circumference. The company was conducted by the guides to the Castle, where His Grace gave all a condial welcome. Refreshment was placed for the visitors in a tent, to which His Grace directed them in the most kindly minner. A visit to the highest tower of the eastle was made, and here one of the grandest views in Scotland is had, the whole landscape being like one vast park. The specimens of Abies nobilis, Cedrus atlantica glanca, Cupressus, Oaks and Blrches, make a beautiful picture when looked down upon from the tower.

The spacious gardens under the charge of Mr. Crossie, who

The spacious gardens under the charge of Mr. Crosser, who has been gardener at Buchanan over thirty years, are in flue order. The gay terraces, the long borders of flowers, and the vegetable-garden, are most creditable. The number of glasshouses is considerable, and Includes a range of over 400 feet long. Fruits outside, Anales in particular, are a good crop.

long. Fruits outside, Apples in particular, are a good crop.

Mr. Dynn having expressed the thanks of the company to
His Grace for the great kindness extended, the party left,
full of happy remembrances, for their respective homes.

A VIOLA CONFERENCE.

Arearst 8 .- This gathering took place in the Museum of the Royal Botanic Society on the above date, Mr. A. J RowlerRy, the Charman of the Conference, presiding. There was a farly good attendance, mainly of members of the National Viola Society, a special summous having been issued by the Secretary. After reading some apologies for non attendance, the Chairman, in his opening address, state 1 that two Conference meetings had been held in Birmingham, one in 1894, and one in 1895; and being fully reported in the gardening papers, had attracted a good deal of attention. This led to the convention that a Conference held in London would command a still greater support. In London and its suburbs there has been during the past few years a great stride made in the cultivation of the Viola, and a successful Conference could be in ide tho means of extending its culture The Council of the Royal Botonic Society had thrown open their gardens to the Conference, and given facilities for a comprehensive trial of Violis, the results of which would be laid before that meeting. The careful inspection made by a Committee of experts occupied several hours; and their attention was directed to the vidue of the Viola for general decorative purposes in the garden, quite apart from any considerations as to its uses for exhibition.

The report of the Inspection Committee was then read by Mr. R. Dean, the Secretary of the Conference, from which it appeared that the following varieties had been awarded marks equivalent to a Certificate of Merit:—Princess Louise (A. Irvine; Rosea pallita, Wm. Nie!, Bridegroom, J. B. Riding, Pene utland, Actue, Rose Queen, 217-8. A Irvine; 596-8. A. Irvine; the Mearus, Archie Grant, Ardwell Gem, Countess of Hopetonu, Princess Ida, Buchess of Sutherland, Sylvia, Rosine, Countess of Wharnelliffe, Snowflike, Border Witch, Lord Elcho, Niphetos (syn. Marchioness, Bullion, Lemon Queen, Norah May, Mrs. C. Turner, Luteola, True Blue, Princess Beatrice, Countess of Kintore, and Ivanhoe.

Countess of Hopetonin, Princess Ida, Buchess of Sutherland, Sylvia, Rosine, Countess of Wharnchiffe, Snowflike, Border Witch, Lord Elcho, Niphetos (syn. Marchioness), Bullion, Lemon Queen, Norah May, Mrs. C. Turner, Luteola, True Blue, Princess Beatrice, Countess of Kintore, and Ivanhoe. The Committee next proceeded to make selections of the best varieties of different types and colours, dividing them into two main sections firstly, dwirf growing, having closer, compact, utifel habits; and secondly, those of a taller and more spreading growth, well adopted for assocition with other plants which could afford them a certain amount of support.

amount of support — White Niphetes (syn. Mirchioness), Countess of Hopetonia, Pene diffand. Snowflake. all dwarf growing Countess of Whitelife and Gigantes. Crane), tall or spreading

Cream White.—Sylvia and Lemon Queen, dwarf growing. Abington and Nellie, tall growing or spreading.

Principle or Sulphur.—Ardwell Gem and Luteola, dwwf growing. Sulphurea, tall or spreading.

Deep Yell in — Princess Louise (Irvine), Lord Eleho and Bullion, dwarf growing. Mary Gilbert and A. J. Rowberry, tall or spreading.

Duck Blue,—True Blue and Mrs. C. Torner, dwarf growing.

Archie Grant and Max. Kolb, tall growing or spreading.

Blue,—Roland Graeme, dwarf growing; and Ivanhoe, tall

Bluc.--Rokuid Graeine, dwarf growing; and Ivanhoe, tall or spreading.

Light Blue Diana and Blue Gown, dwarf growing; and Favourite, tall growing

Leveleter or Lilos. Roseap dlida and Lottie McNiel, dwarf growing. Duchess of Sutherland, Bridegroom and Nabob, tall or spreading.

Prople.-Acme and Mrs. Gordon, dwarf growing J. B. Riding and Dorothy Tennant, tall or spreading.

Rose.—Princess Ideand Rise Queen, dwart growing. Wm Niel, Rosine and Magie, tall or spreading.

Blash. Chum and North May, till or sprending

There were no dwarf growing varieties of this colour

Eiged or Bordered Duchess of Fife, Birder Witch and Blue Cloud, dwarf growing Cissy Thornley and Colleen Bown, till or spreading

Force: Countess of Kentore type, dec. - The Mearus, Bethune, Cissy Mellowes and Columba, dwarf growing. Countess of Kintore, Isabel Spencer, Princess Bettrice, Lady Amory and Mrs. Bellamy, tall or spreading.

Stripet.-Lily Lungtry and H. W. Stewart.

VIOLAS FOR LONDON PLANTING.

The Chairman having inquired if any one desired to discuss the selection made by the Investigation Committee, Mr P G. Sinclair referred to Violas which had stood well in London, near to Highpate Hill, in a smoky atmosphere, instancing the following varieties as most valuable for London planting, viz., Lady Isabel, Ardwell Gem, Goldfinch, Lemon Queen, Charm, Duchess of Fife, Countess of Kintore, J. B. Riding and White Duchess. The plants were put out in March last. Violas were a leading feature of his garden, but he always made a point of changing every year the spot upon which the Yudas grew. Mr W. Curmentson (Donata & Co.) pointed out that all the Violas, except Lady Isabel, mentioned by Mr Sine Lam, were in the selection of Violas made by the Committee. Dr. Shakkliton, as residing in the South of London, said that long had done well with him, in addition to most of the Violas named by Mr. Sinelair. He thought the Conference might turn its attention to the cruses of Viola plants dying off swebouly, and especially those planted out previous to the winter. He had endeavoured to discover the cause, but had not yet succeeded to his stisfaction. Duchess of Fife generally does well in his garden, but many had died off this year from some cause.

VIOLA ILLUSTRATIONS

The Secretary, Mr R Denn, then laid upon the table copies of Viola studies Nos. 1 and 2, the former being a series of diagrams and coloured illustrations, dealing with "Tricolous," which had been presented to him by Dr. Vitt B WITTROEK, Director of the Botanical Garden, Bergisland, Stockholm, in order that the Conference might gain some idea of the work in which Dr. WITTROEK as engaged. No. 2 was "A Contribution to the History of the Pansies," with an English shidgment, which Mr Denn stated had appeared in two consecutive editions of the Girchard Chronele in June Last. In a communication from Dr. WITTROEK he stated that the plates belong to a paper upon Violas, of the Section "Tricolores," that will be published in some weeks. They contain figures, with microscopic analyses, of almest ill the parent species of the cultivated Pansies. Viola tricolor L is represented on the plates I IV, and partly also on the plates X=XII, by numerous, mostly new, subspecies, varieties and forms; Viola lutea, Huds., on the plates VI, VIII, and IX; Viola cornuta, L., is depicted on the plate VII, and yenderation VII and VIII; the Hungarian V. declinata, Waldst & Kit., the French V. hispida, Lun. (-rothomagensis), and the Algerian V. Mumbyana, on plate XI. Of Viola arvensis, Murr. (which seems to Dr. WITTROEK to be a very "good species"), there exists some figures, showing different new subspecies, on the plates VI, VIII, X and XI. Hybrids of the species Viola cornuta, V. latisepala, V. Intea, V. tricolor, and V. arvensis, on plates VII, VIII, IX and X. "All the figures were drawn, under my direction, most accurately by skilful artists, after living specimens, which for the most peat have been cultivated in our Botanie Garden, or have been collected wild here in Sweden." On the motion of Mr. Kin Laik, the Scerdary was requested to convey to Dr. Wittracek the thanks of the Conference, and also to express

him their hearty appreciation of the importance and value of the work he is accomplishing.

(To be continued,

CLAY CROSS FLORAL AND HORTI-CULTURAL.

Accors II. Annual exhibitions have been held at Clay Cross confiniously for thirty nine years, and it is still the best in the comy of Derbyshire, owing to the action of the committee in increasing their patternments beyond that offere thy their keen rivels at 4th helf and Chesterfield. The attendance of the exhibition on Tuesday last was very large. In the class for groups, Mr. J. Ward, gr. to Mr. T. H. Oakes, J.P., of Riddings House (where some most remarkable Crotons have been cultivated), has held his own for eight years in succession. It is doubtful if a finer group than Mr. Ward put up on this occasion has been seen in Eugland this year. This is probable from the fact that Mr. J. Edmonds, gr. to the Duke of Sr. Albans, who was 2nd, showed the same group which was awarded 1st prize and the Silver Cup at Chester last week; and Mr. C. Mee, of Daybrook Vale, who was 5th here, was 1st at Leicester with a similar arrangement. Mr. Ward also received the premier award for the smaller group, occupying 100 feet; and Mr. M. W. Hasham, of Hardroff, who was not noticed at Chesterfield, secured the 2nd prize. Mr. Ward's group, covering an area of 200 feet, contained a most comprehensive variety of plants; the quality and growth were superb, and the arrangement most arbistic. The centre piece was a Kentra Palm, which was surrounded in hill and dale with Lilium auratum, beautifully-coloured Crotons, lovely salmon coloured Ixoras, Orchids, Eulalias, Ferns, an i Mosses.

Bouquets produced a lively competition, the exhibits running the whole length of one of the three large marquees. In the end, Messis, Proofor & Sons, of Chesterfield, triumphed ever Messis, Pranson & Sons, of Chil ell Nurseries, for the bride and bridesmaid's honquets.

The fruit throughout called for many comments, and the Melons, Peaches, and Nectarines were specially fine.

CARDIFF HORTICULTURAL

Against 12.—This was the eighth annual Exhibition of this Society, and by a happy arrangement with the promoters of the Cardiff Exhibition, now in course of being held, the Flower Show was associated with it, the marques being pitched on the western side of the ground. The entries were numerous, some $\mathfrak{C}^{(30)}$ being offered in prizes, besides caps and medals, and the classes were generally well filled. On the whole the show was a very good one, and the weather being fine there was a very large attendance.

In the division for 11 NNTS open to all, stove and greenhouse plants played an important feature, though the flowering specimens were included in another division. Mr. T. Clark, gr. to Sir E. S. Hille, M. P., had the best four Fuchsias, fairly good, though not equal to what we are accustomed to see in the West of England. Mr. W. L. BLAKE, Cardiff, was 2nd.

the West of England Mr. W. L. Blake, Cardill, was 2nd. Stove and Greenhouse Ferns, shown in sixes, were a leading feature, and some very fine specimens were staged; the best six came from J. Gunn, Esq., J. P., Llundaff, Mr. R. McLeod, gr., chief among them being Davallia Mooreann, a splendid piece; Asplenium nidus, very fine; Gymnogramma chrysophylla, Adiantum Farleyonse, a tine Chothum, and Adiantum trajezifornoc. Mr. Hockey, gr. to Cod. Page, Cardiff, was 2nd; he had also Davallia Mooreana, very fine; Adiantum tenerum, and Davallia solida.

Zonal Pelargmenus were in good specimens, though not so good as we have seen them at Cardin. Some fairly good begonias, double and single, were staged, but they are susceptible of improvement.

Group of Plants were shown in three or four classes, the principal one, filling a space of 100 superficial feet, came from Messrs Cave Bross, Florists, Cardiff, and like the others competing in this class, it was arranged in a circle, and was composed of Palms, bright Crotons, Lilies, &c., rising out of a bed of fern; the whole edged with Pameum and other plants of like character.

The smaller groups, occupying a space of fitty feet, were arranged at the side as semicircles. Here Mr II McLew, gr. to J. Gunn, Esq., J.P., Llandaff, was 1st. The best group, occupying twenty-five feet, crime from Mr Rin, gr. to C Williams, Esq., Llandaff, Mr. G. Hall, 20 fo E. Livir, Esq., Llandaff, was 2nd.

There was also a class for a collection of Tuberous-rooted Begonias in flower, Mr. T. Clarke being 1st, and Mr. T. Malpas, gr. to J. L. Thoune, Esq., Cardiff, 2nd; both being very gry with colour.

In the division for anateurs and genflemen's gardeners, the best six stove and greenhouse plants came from Mr. T. Lockver, Pontypool Park Gardens, who had six finely-grown and flowered examples of Bongainvillea Sanderiana in very fine condition; a capital piece of Gloriosa superba, Allamandas Hendersoni and nobilis, Anthurium Scherzerianum, and Statice profusa; 2nd, Mr. T. Clarke, who had good specimens of Justicia carnea, Allamandas Hendersoni and grandiflora, Bongamvillea glabra, and others. Tuberous Begonias were shown in sives, and Zonal Pelargoniums in fours, all fairly grown and bloomed.

Mr. W. J. Buckley, Llanelly, had the best four fine foliaged plants, staging a lunge Lutann borbonica, a fine Cycas circinalis, and two highly-coloured crotons; Mr. Mabbott, gr. to E. P. Marrin, Esq., Dowlais, was 2nd.

With four ferns Mr. J. Gunn was first, an excellent even quartette, fresh and bright, consisting of Adiantims tenerum, Farleyense, and concatum, and Microlepia hirta cristata; Colonel Page was 2nd, having a good piece of Dayallia Mourgana with Adiantim tenerum.

Mooreana, with Adiautum tenerum.

The best specimen stove and greenhouse plant was a grand piece of Clerodendron Balfourianum from Mr. Locker, and this was also awarded the Williams Memorial Well as the best specimen plant in the show.

In the CUT FLOWER DIVISION Roses made a very pleasing feature indeed, being so much better than could have been expected. The best twelve trebles came from M. STATHEN TREEDER, Carliff who had Duchess of Bedford, Dupny Janain, Mrs. J. Lung, Alfred Colomb, Madame Victor

Verdier, Mons. E. Y. Teas, Dr. Audry, François Michelon, Fisher Holmes, &c.; 2nd, Mr. R. Crossling, Penarth, who had Dupuy Jamain, Victor Hugo, very fine, Duchess of Bedford, Jean Soupert, Prince Arthur, and Capt. Christy. For twelve Teas in trebles Mr. S. Tressber was again 1st,

For twelve Teas in trebles Mr. S. Treseder was again 1st, having in fine character Maréchal Niel, Madame Hoste, The Bride, Media, Pelè des Jardins, Maman Cochet, Bridesmaid, François Kruger, &c.; 2nd, Mr. B. Crossling, bis best blooms being François Kruger, Media, Madame Lanhard, and Rubens.

With twenty-four distinct varieties Messrs. Townsend & Son, nurserymen, Worcester, were 1st, having very good blooms of A. K. Williams, Madame E. Verdier, Mons, E. Y. Teas, Etienne Levet. Alfred Colomb, Star of Waltham, Charles Lefebvre, &c. Mr. S. Tressder was 2nd, his leading blooms being Victor Hugo, Madame Eug. Verdier, A. K. Williams, Mons, E. Y. Teas, Eugene Verdier, &c.

With eighteen varieties of Teas, Mr. S. Treseder was 1st, with excellent blooms of Manam Coehet, Mrs. S. Treseder, a sport from Anna Olivier, Madame H. Jamain, The Bride, Bridesmaid, Rubens, Hon. H. E. Gifford, and Mr. James Wilson, being his best; Messrs. Townsend & Son were 2nd. Messrs. Townsend & Son were 1st with 12 blooms of any one variety, having Mrs. J. Laing in superb condition; and the best twelve Teas of any one variety also came from Messrs. Townsenn, they having The Bride.

Doblius in twelves were fairly well shown. Mr. W. Treselfer, nurseryman, Cardiff, was 1st with twenty-four, and Messrs. W. Heath & Son, nurserymen, Chellenbam, were 2nd. The best twelve bunches of Caetus varieties were also from Mr. W. Treseder. He had, in capital condition, Mrs. Wilson Noble, Bertha Mawley, Cannell's Gem, Harmony, and Miss A. Jones. Mr. John Basham was 2nd, Dahlias were also shown by gentlemen's gardeners and anacteurs.

Asters and Phloxes were much below their usual form. There were some good collections of twelve bunches of hardy perennials, also of cut zonal Pelargoniums, stove and greenhouse cut flowers, and Carnations.

FRUIT made a good feature also. The best six bunches of Grapes, in not fewer than three varieties, came from Mr. R. Grimson, who had finely-finished examples of Gros Maroc, Bowoo I Muscat, Black Hunburgh, and Foster's Seedling. Mr. T. M. FRINKLEN HULLIY was 2nd with Gros Maroc, Muscat of Alexandria, and Alicante—two bunches of each, Grapes were in stands of three bunches, and also in single bunches, but owing to the crowded tents it was difficult to get particulars.

Mr. R. Grimon had the best six dishes of fruit, staging good examples of Muscat of Alexandria Grapes, fine Peaches, Nectarines, Figs, &c.

Apples, both dessert and culinary, were very fine; Mr. G. GARRAWAY, Bath, being 1st with six dishes of dessert, as well as the same number of culinary varieties. Cherries, thoseberries, Pears, &c., were very good, but the act of gathering up particulars was physically impossible.

The VEGETABLE tent was No. 5, and in the open class there were four collections, all very even and well selected. The 1st prize was won by Mr. 8. WHALAMS, Glyn Neath, who had remarkably good examples; and Mr. G. GARRAWAY, Bath, was 2nd.

Seven collections competed for Messrs. Sutton & Sons' Special Prizes, and here also high quality was conspicuous. The 1st prize went to Mr. C. Foster, gr. to Gen. Lee, Denis Powis.

Messis Garliaway & Co,'s Special Prizes also brought very good results. 1st, Mr. E. P. Martin (gr., W. Mabbott); 2nd, Mr. D. Powell, gr. to Col. Walley, Newport.

Potatos in six dishes were very good indeed for the season, white and coloured. There were eleven collections of six dishes, and three or four of them cane very close together.

Beet was in plenty and of several varieties, and Cauli-

Beet was in plenty and of several varieties, and Caulitlowers, Turinjs, Potatos in dishes or half pecks; very fine Celery, Garrots, Onions, Parsnips, Leeks, Peas very good for so late. Grand Searlet Runners, excellent Broad Beans, Cuennibers, Tomatos, Lettuce and Vegetable Marrow. Cuttagens' Productions filled one spacious tent. Among

CHTMGERS' PRODUCTIONS filled one specious tent. Among the leading plants were zonal Pelurgoniums, doubleand single, but in very large pols, generally very good specimens variegated; capital bush Fuchsias; some highly creditable Begonia Weltoniensis, tuberous Begonia, one good specimen of the Rex type. Good Musks, Harrison's especially; Myrtle, Mignonette, collections of six plants, very good; the best two Fuchsias and two zonal Pelurgoniums, and two double Petmias, all grown in windows.

Collections of cut flowers, in six bunches, were remarkably good: Salpiglossis, Sweet Peas, Gaillardia Lorenziana, Drummond's Phlox, Gladiolus, Anemone japonica alba, tuberous Begonias, Asters, Malope grandiflora, Roses, Stocks, Verbena, &c. Then there were bahlias in sixes, one half-dozen in particular being very good. Phloxes, rather poor and past their test, with classes for Carnations, Asters, Stocks, African Marigolds; some very fine orange-coloured blooms being staged. French Marigolds, a few handsomely striped Pansies, and baskets of wild flowers.

surped ransies, and baskets of wild flowers.
Then of vegetables, there were excellent collections of nine dishes, worthy of any gardener. Potatos, clean, bright and bandsonie; good Cauliflowers, superb Celery, highly-coloured clean Carrots, the Nantes and new red intermediate being prominent; capital Barsnips, fine Onions, autumn and spring, with Peas, Scarlet and French Beans, very good Broad Beans for the season, Commbers; Cabbagos, red and green, in great abundance, and all very good; Turnips, Leeks, some aduntable for the season; Yegetable Matrows, though rather large; Rhubarb, Shahlots, nost of them very fine and well selected, and larkels of Paraley.

ENOUIRY.

"He that questioneth much shall learn much."-BACON.

CAN any reader give me the address of a firm who makes or supplies a hand-machine for filling small seed pockets? G. B. [Dealers should advertise their wares. ED.]

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or helow 42° Fahr. for the period named: and this combined result is expressed in Daydegrees—a "Daydegree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

SEEDS.

SEEDS.

London: August 12.—Messus, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report a strong inquiry for Trifolium stadvancing rates, supplies meantime are mpidly falling off. Fine new home-grown winter Vetches come good and closap. Choice new crop Essex Giant Seed Rye, is also most reasonable. White Mustard is in brisk request on former terms. Sowing Rapeseed keeps steady. Some extra bold new Spanish Canary seed has just arrived. Buckwheat commands a sudden and substitutial advance. Linseed is dearer. Peas and Haricots are this week without feature. The Board of Trade Returns give the imports of Clover and Grass seeds into the United Kingdom for the first seven months of this year as ewis. 25,651, value £489,138, as against cwis. 296,749, value £564,663 for the corresponding period of 1895.

NOTICES TO CORRESPONDENTS.

APRICOTS: Apricot. Most are sound enough, but one is rotten, and there is nothing in the fruit to show the cause. The names you require are—1, Kaisha; 2, Shipley's.

CAULIFLOWER: John Adams. Clubbing, due to a slime-fungus. Burn all the affected plants, and be careful not to grow any of the Cabbage tribe on the same soil. Gas-lime has been used with advantage.

DISUSED BOXES, &c.: IV. C. They may or may not be valuable, we cannot tell. You had better advertise them. In regard to the second question, You had better it is impossible to say to what cause the disfigurement to your plants is due, unless we had some knowledge of the conditions under which they have been grown. A check to growth, from whatever cause, would produce the injury you cannot be seen in the second of the conditions of the second of the complain of.

EMPLOYMENT IN INDIA: Thea. Many such positions as you desire are filled by graduates from the Royal Gardeus, Kew. We are unable to direct you as to the best means to adopt in order to secure a situation in a private Tea plantation.

GRAPES: Constant Reader. We imagine from your description that the berries are "shanking," but you should send us specimens. Have you made quite sure that the Vines are not rooted in the outside ground referred to, and that they have not descended too deeply.' None need be deeper than 2 feet from the surface. Do not over water the border, neither allow the laterals to grow so long that the removal of them becomes a check.

INTERPRETATION OF SCHEDULE: Hortus. The difficulty arises from the vague wording adopted by those who are responsible for the compilation of the schedule. "Twelve ounches of cut flowers, distinct, outdoor, not more than one variety in a bunch." Literally, a competitor appears to be entitled to exhibit exotic species which have been cultivated out-of-doors, but which are not necessarily hardy. It is likely, however, that it was intended by "outdoor" to signify hardy flowers, and we are not prepared to say you would not be liable to disqualification were you to exhibit such flowers as Begonias and Pelargoniums. But such a course would hardly be just. "For the best six dishes of fruit, distinct sorts." In this case we are inclined to the opinion that an exhibit would not be disqualified on the score that it contained two dishes of Grapes, one a white and the other a black variety. The schedule, however, should be more explicit and precise. See the Rules for Judging issued by the Royal Horticultural Society.

LILIUM AURATUM STEMS E. P. d. Co., Bristol. ciated stems are usually due to over-growth, the result of too abundant nutriment-not uncommon.

MELONS AFFECTED BY BACTERIOSIS. J. F. S. has sent us specimens of diseased Melon plants, which attacks the stem at the joints, where it becomes brown, soft, and rotten in a very short time, There is no external appearance of mould or pustule, and yet the plants fail, and are killed speedily, whilst beforeliand they appeared to be in vigorous health. Microscopical examination showed that all the cells in the diseased spots swarmed with minute bacteria-like bodies about 5 micromillemetres long or more, and in the latter case divided in the centre. From information supplied, we gather that "nineteen plants were lost, when the whole house was cleared out and washed, syringed with a mixture of paratin, and then a fresh bed was made with fresh loam, but still the disease is there. It is added that the plants have been kept as dry as possible to obviate any chance of damp." Reference may be made to an account published in the *Botonical Gratte*, November, 1891, and quoted in this journal, describing a form of disease in the United States, which attacked Melons, Cucumbers, and Gourds, and was capable of being transferred to Tomato plants. Not only were the stems affected near the roots, but also the fruits. In all cases the bacterialike bodies were swarming at the affected spots. Shortly after this period, we saw Gourds grown in the open in this country, the stems of which rotted off near the ground, and we attributed the cause somewhat reservedly to this disease. There are one or two facts which must be borue in mind in all efforts to deal with the present pest. Firstly, that it is an eudophyte; that it is fully established within the tissues of the plant before there is any external manifestation, so that when the plants are seen to be diseased it is too late to apply outward solutions. Secondly, that it has been shown that by transfering the juice of these decayed spots to healthy plants, these can be inoculated artificially with the same disease. Hence the disease is liable to spread rapidly unless attended to, and all diseased plants rooted up and burnt. We must all regret that this now disease should have made such a definite appearance in this country, but, it its spread is to be prevented, drastic measures will have to be taken, and it will have to be stamped out. It might possibly be an advantage to apply some copper solution to young and healthy plants as a preventive, perhaps at intervals of three or four days, but we can suggest nothing which would save the plants after there is any external manifestation of the disease (see Gardeners' Chronicle, June 3, 1893, p. 668). M. C. C.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—F., Leeds. 1, Dactylis glome-rate variegata; 2, Cyrtomium falcatum; 3, Polystichum angulare; 4. Asplenium bulbiferum; 5, Davallia bullata; 6, Polypodium aureum.—Wales, 1, 2, and 3, all varieties of Odontoglossum luteopurpureum; 4, Odontoglossum Lindleyanum.—

S. L. Epidendrum aciculare.—A. B. Cuscuta curopea, Dodder.—Anemo. 1, Perhaps Erica arborea; 2, Cotoneaster Simonsi; 3, Escallonia rubra; 4, Cupressus pisifera var. squarrosa (Reti nospora of gardens); 5. Euonymus japonicus variegatus.—W. G. Syringa Josikica.—S. S. 1, Pastinaca sativa; 2, Symphytum officinale; 3, Staebys sylvatica; 4, Hypocheris radicata; 5, Melilotus alba; 5, Euphrasia officinalis.—R. J. L. Scolopendrium vulgare crispum.—J. O. E. 1, Ledio-Cattleya x Schilleriana; 2, Lælia crispa; 3, Miltonia spectabilis.—C. B. 1, Berberis vulgaris; 2, Hibiscus syriacus, the Althca frutex of gardens. Fruits next week, and further answer.—J. H. B. Angelica sylvestris.—Solanum. We cannot undertake to name varieties of Potatos. purpureum; 4, Odontoglossum Lindlevanum. take to name varieties of Potatos.

POTATO: E. M. B. The appearance is due to irre gular and excessive growth, probably due to the insect [puncture, but we will examine and report l ter on.

RENOVATING VINE BORDER: J. D. The treatment you suggest would be beneficial. Do not allow the roots to run under the gravel-path. See note upon Vines in our Calendar in present issue, and by similar treatment recommended there, endeavour to keep the roots near the surface, where you can feed them as occasion requires.

Tomatos: A. II. The foliage shows no trace of disease, and there is little to indicate the cause of failure, except a suggestion of stagnant water at the roots. Nearly all the roots are curiously hyperroots. Nearly all the roots are curiously hypertrophied with nodules resembling the clubbing of Cabbages in miniature. We failed to find in any of the cells the plasmodia of Plasmodiophora, but there is more suggestion of that than of anything else. M. C.C.—W. W. We can see no disease in your Tomato foliage, but it is weak, as if deficient in ventilation. Evidently there is some failure in cultivation; possibly too crowded, and with too little ventilation. Any fungus disease would soon show itself on the leaves. M. C. C.—Market Gar. deav. Froguore Selected, The Polegate, Sutton's Mainerop, and Tender-and-True, are all capital Maincrop, and Tender-and-True, are all capital varieties for the purpose you require them, or for gardens generally. They are all free heavy croppers of the Perfection type.

TOMATO, A FRUIT OR VEGETABLE: W. M. The Tomate, from a botanical standpoint, is a fruit. It is also used as a dessert fruit by many people. In regard to exhibiting this vegetable product, it has been found convenient by most societies to include it with the vegetables or salads, and the decision of the judges in your case was by no means extra-ordinary. In the Rules for Judging, issued by the Royal Horticultural Society, which for the present should be the recognised authority for the settlement of such points, is the following: —"Tomatos are only recognised as dessert fruits where specifically admitted by the particular schedule, thus: 'Tomatos admissible.'"

Messes. F. SANDER & Co., St. Albans

Messrs. F. Sander & Co., St. Albans.

A CATTLEYA SPECIES, from the neighbourhood of Rio. Every Plant received is offered. Collector calls them an entirely new large Trianæ, flowered type, or a variety of C. Warneri. He has never seen any Cattleya resembling them, except Trianæ, he thinks them quit; new, and is certain they are neither Swainson's nor Gardner's type. As many as eight flowers are borne on a spike. They are of fine shape, very rich in colour, from white to bright crimson. They are wonderfully distinct-looking, many of the plants appearing intermediate between aurea and Warneri. No plants have ever before been gathered from this district.

this district.

CYPRIPEDIUM NIVEUM, the Bifforum or Tambelan Island type. The finest of all, noted for the large size and satiny whiteness of the flowers, and the abundance with which they are produced. The type offered is the freest to flower, the easiest to grow, and the most pleasing of all. C. nivenm is now very scarce and almost impossible to obtain; niveum hybrids are among the daintiest and most valuable of all hybrids.

CATTLEYA GIGAS from Santayuni. The contents of a small case, all our man could obtain. The finest of all gigas, and a Cattleya almost unequalled. Also—

CYPRIPEDIUM INSIGNE MONTANUM, from the district which has yielded so many valuable varieties. A most varied-looking lot of placts, in spleadid order. A con signment of our celebrated—

LANG TANO VAR. OF DENDROBIUM NOBILE, ODONTO-GLOSSUM ALEXANDR.E. Very finest Pacho Type, Most distinct and varied-looking plants, both in shape and colour of Bulbs. Also—

Sophronitis grandiflora, Cypripedium exul, Dendrobium san-guionlectum, Lælia Dormaniana, Oncidium varicosium Bogersii, O. crispum granditlorum and O. prætextum, Sacoolabium giganteum, an Awrides species from Northera

VANDA SPECIES, imported with V. cortulea, but very distinct in appearance from that species. Aerides crassifolium, Lælia harpophylla, L. præstaus, &c., &c. Also Orchids in Flower and Bud.

On view morning of Sale and Catalogues had.

MONDAY and WEDNESDAY NEXT. DUTCH BULBS-DUTCH BULBS

C. STEVENS will SELL A. J. C. SIEVENS WIII SELLE by AUGUSTON, at his Great Rooms, 38, King Street, Covent Garden, W.C., on MONDAY and WEDNESDAY NEXT, August 21 and 26, at helf-past 12 o'Clock precisely, splendid importations of choice named Double and Single

HYACINTHS,

TULIPS,

CROCUSES,

Rare NARCISSUS, COLCHICUMS, SNOWDROPS, and other BULES from Holland, and specially lotted to suit both the TRADE AND PRIVATE BUYERS.

Gardeners' Chronicle.

SATURDAY, AUGUST 22, 1896.

VIOLA TRIALS.

N spite of a recent dictum that Violas would not thrive in the neighbourhood of London, there has been during the summer ample evidence in the Royal Botanic Gardens, Regent's Park. that these plants will, when properly cared for, do remarkably well. There in a very hot corner, and on a series of raised beds, conditions at the outset distinctly unfavourable, the trial of Violas has proved to be singularly successful, and all those persons who attended the Conference on Violas held in the Museum on the 8th inst. expressed surprise in finding such admirable results. A very large number of varieties were planted, six plants of each. They were, when put out last spring, indiscriminately commingled, and for picturesque purposes no doubt that was the best.

As the trial is to be continued somewhere in the Gardens next year under Mr. Sowerby's control, it may, perhaps, not be too much to suggest that, for purposes of comparison, it would be better could the varieties be grouped according to their colours. That is a condition that, with better knowledge now, it would not be difficult to carry out. Again, a good deal of consideration was given at the Conference to the question as to the relative values of autumn and spring planting in the metropolitan area and southern counties.

As a trial of Violas is also promised at Chiswick, it would be well if in both gardens simultaneously autumn and spring planting could be adopted, also the blocking of colours as suggested. Mr. Moorman, of Victoria Park, holds that London winters, especially the fogs, kill the plants wholesafe; but his district is a peculiarly foul one. In other distriets, and possibly in the Regent's Park, the same trouble may not be existent. The plants as a rule are very hardy, but the hardiest things may be killed by the London fogs. For autumn planting, none is better than plants obtained by lifting old cut-back ones, and replanting well-rooted pieces. For spring-planting none is better than those obtained from cuttings taken from root-shoots, set thickly into sandy soil in a cold frame in September. These will furnish plenty of strong-rooted plants to put out in April, or even earlier. With the great stock now at disposal, Mr. Sowerby can do both things admirably. At Chiswick a test of this description can only be carried out this season by growers sending in old plants divided up in September, and others from cuttings in the spring. At the Botanic Gardens, where the trial comes more immediately under the inspection for Awards of the Viola Conference, many varieties are grown that are perhaps more useful for exhibition in spray form than for bedding or massing purposes. That is entirely a matter for the Viola Conference to determine. Of course, a large number have very high merits for garden decoration. At Chiswick the proposal is to have only varieties that are adapted for hedding or massing, and doubtless it will be in reference to such uses they will be regarded by the Floral Committee when called upon to examine the plants. It is well, however, to make it clearly understood

that these who employ Violas largely for bedding purposes, do not limit themselves entirely to varieties that are of dense, compact habit. These are admirable as carpets, edgings, &c., and are of special value in spring-gardening. There is also a most useful-indeed, valuable—section, which, giving looser or taller growth intermix or blend most beautifully with other descriptions of plants in beds and borders. Of these it is but needful to mention for example Duchess of Sutherland, soft mauve. For that reason, in judging bedding Violas, this feature also must have full consideration. It has been truly said that no other bedding plants lend themselves so effectively for bedding in the mixed sense, or for massing singly, as Violas do. They are so hardy, and easy of propagation, that they become literally everybody's

It is so generally held that the soil for Violas should be changed every year, that it is hardly probable the Botanic Gardens site will be the same next year as now. At Chiswick the long narrow border fronting the cordon Pear tree hedge, affording as it does, not only entirely fresh ground, but also sufficient space for six plants in each row, and some shade behind, whilst a broad footpath runs along the front, seems to present an ideal spot for the ensuing year. The important position that these plants now occupy in spring and summer flower gardening, as also the rapid development found in the production of varieties furnishing varied hues of colour, should give to the Chiswick trial great interest. It is not too much to hope that the trade, as well as numerous amateur growers and raisers, will render every assistance in making the trial a great practical success. I should like to see added to Violas proper, early-blooming Pansies. It is admitted that but very few Violas are to be classed as early bloomers. I fear as much may be said of Pansies; but at least Blue King is very early; indeed, we have not, so far, in the entire range of Pansies or Violas, anything that is so early. I have no doubt I can secure plants, not only of that variety, but also of some other, popular for spring-bedding or market purposes. Pausies or Violas that, planted in the autumn, will give good masses of colour for carpets to bulbs or other plants, or for edgings in the early spring, say March and April, are most valuable. We want them to bloom with the Princoses, Aubrietias, Arabis, Myosotis dissitiflora, &c. It would be well if raisers would strive to obtain such forms rather than spend so much labour in obtaining varieties hardly differing from others, and perhaps only fit to give flowers for exhibition. Returning to the Regent's Park trial, I noted on the 8th as most floriferous and effective, after a very severe ordeal, White's Snowflake, rayless and pure, compact : Pencaitland, same habit, but with a flush of yellow in the flowers. Countess of Hopetonn, always good; Marchioness, compact; Colleen Bawn, taller; Gigantea, fine tall white; and Blanche, violetta type, very free. Nellie was also a charming white. Yellows were plentiful; of these very good were Bullion, the best rich yellow; Lord Elcho, also good; Prince of Orange, excellent; Catherine, straw yellow, soft and good; Ardwell Gem, straw yellow, still one of the best; Lemon Queen, soft lamon; and a seedling, Taylor's Yellow, of rich butter-colour, compact and free. Of what are termed Mannikins, there is great variety, though none excel in beauty Duchess of Sutherland. Rosca pullida is very pale, yet pleasing; Bridegroom is a deeper mauve and effective; Favourite is a bluish mauve, somewhat rayed; Diana, also a pale blue, and rayed, is very pleasing. Of deeper blues, the only one, and still the very best of its section, is True Blue. All the Archie Graut section, including William Haig, very effective; Max Kolb, Joppa, and others, are more purple than blue. The latter more closely resembles Holyrood. Ivauhoe and The Tory are really paler purples, but not blues. There is ample room for more of the True Blue section. Reddish tints are fast developing. Of these, the very best so far seems to be William Niel, and it will be hard to beat, except in depth of colour. Mrs. Gordon is a step in that direction, and is well worthy a wide trial. Border Beauty and Dorothy Tennant are also

excellent reds. Of whatare termed purples, though more nearly reddish-plum or maroon in colour is Acme, though oddly enough this is almost a reproduction of the old Clivedeu Purple. Next come Lillie, pale plum, flaked maroon; and Tiny Millar, dark red, flaked maroon, both of which of their section are very charming. Isabel seems to be the best of the violet and white-blotched section, of which Countess of Kintore is the well-known type. These, however, though beautiful as exhibition flowers, are most useful for outdoor purposes when in mixed beds.

Now that the Conference is past, it would be a capital plan to have all the plants hard cut over, and then in a month's time they would be in fine condition to lift, divide, and re-plant. If they did well, and there is no reason why they should not, in the open space of the Regent's Park, they would serve admirably for spring blooming or otherwise. At D.

NEW OR NOTEWORTHY PLANTS.

CIRRHOPETALUM GRAVEOLENS, Lindley.*

The plant now blooming in the Botanic Garden greenhouse, was brought to Brisbane from New Guinea a few years ago by Sir William Macgregor. It is a showy species, but the strong disagreeable odour of its flowers will probably prevent it becoming a favourite in cultivation, except where collections of these curious and beautiful plants are kept. The strong odour of the flowers seems to have the effect of attracting and stupefying flies, so that, when by the turning over of the labellum they become jammed between that organ and the column, they are unable to extricate themselves, and die. This stupefying effect is produced by some other similar strong-scented flowers. F. M. Bailey, Contributions to Queensland Flora., n. xiii., 1896.

EPIDENDRUM GLUMIBRACTEUM. †

This is one of the more or less apocryphal Orchids described in scientific or gardon papers many years ago, and forgotten since the day of publication. The plant was described by Professor Reichenbach in the Homburger Carten Zeitung, 1863, p. 11, but his description in two lines is quite insufficient. He states that the plant resembles Epidendrum clavatum,

Rhizome thick, shortly (reeping. Pseudo-bulbs conical, 3 or 4 inches high, with numerous very prominent angular ribs. Leaves thickly coriaceous, obovate, 12 inches long, 4½ inches broad towards the top, tapering from above the middle and becoming almost petiolate. Scapes about 6 or 7 inches high, bearing a short raceme 7 inches in diameter, composed of about thirteen yellowish, strongly-scented flowers, which are so crowded as to appear almost umbellate. Sheathing scales two, mear the base, the lowest very obtuse: bracts subtending the flowers spreading, ovate lanceolate, about ¼ meh long. Pedicels, with the ovary, which is short and prominently grooved, about 1½ inch long. Flowers glossy, yellow, tinged with green, the inner face of all the segments more or less speckled with red. Dorsal sepal about 1 inch long, ½ inch broad, apiculate, marked with nine nerves, incurved over the column; lateral sepuls exceeding 1½ inch in length, coherent nearly throughout, but the one shorter than the other; the two united about seven lines broad and obtuse at the end, or sometimes shortly separated, and the apex of each more or less pointed, each three-nerved. Petals about 5 lines long and 3 lines broad, the midrib exserted in the form of a bristle. Labellum versattle, reddish-brown, turning to deep purple, candiculate, and curved almost into a circle, apex blunt or somewhat elongated, the base bluntly lobed. Column-wings somewhat rhomboid, the upper point or tooth reaching above the anther. Anther-tid glossy, except for a little tomentum in front.

† Epidendrum glumibrac'eum, Rehb. f.—Caulibus e basi tennissina fusiforini incrassatis ad 25 cm. longis, 1-5 cm. cra sis diphyllis, cataphyllis 6 albescentibus vestitis; foliis linearibus loratis acuminatis majore ad 35 cm. longo, 1-5 cm. luto minore paulum diverso, coriaceis; racemo e bulbo nondum maturato oriente distichantho plurifloro (7 to 10°; bracteis glumaceis triangulis acuminatis pedicello cum ovario 7 to 8 cm. longis; sepalis petalisque lineari-lanceolatis acutis margine revolutis; labelli sepullongi gynostemio adnati lobis lateralibus bipartitis partitione postica rhombea margine exteriore cremulato, partit, anticu lineari falcata bidentata, lobo intermedio lineari apice ovato acuto, disco labelli basi bituberculato, androclimi margine denticulato denteculis mediumis sublongioribus. — Flores odori virides, labellum alpum, sepala petalique 3 cm. longa, 2 to 5 mm. lati, labellum apullongum 1 5 cm. latam. F. Kravita.

Lindl., and adds some remarks about the lip. The plant more closely resembles a somewhat sleuder form of Epidendrum ciliare, the bulbs of the leaves having uearly the same length, but not half the breadth. The spike arises from the young bulb when the leaves begin to peep out of the sheathing leaflets of the bulb. The flower resembles a little those of Epidendrom falcatum, but they are much smaller, and the lip is quite different, the side-lobes being two-lobed, and the middle one linear, with an evate or sub-rhomboid apex. The flower-stalk, with the evary, is very long (7 to 8 cm.), and covered only at the base by the brownish glume-like bracts. The plant was originally detected by Warscewicz in Costa Rica, and the fresh material I received lately was also brought from that country. It flowered probably for the first time many years since in the collection of Mr. Paul Wolter, Magdeburg, Wilhelmstadt, one of the most zealons and the most successful German importers of to-day. Epideudrum, generally speaking, is not in fashion, aud this species will not alter the ruling opinion, after all the plant is surely very easy to cultivate in a temperate-house. Finally, if horticulturists are not pleased to see this plant again in Europe, botanists are so. To see the catalogue of doubtful species lesseued even by one number is often more agreeable than to describe a new one. F. Kränzlin.

KEW NOTES.

SPATHELIA SIMPLEX.—This is a West Indian Rotaceous plant, unknown outside of botanic gardens, nevertheless those who see it at Kew (where it is now in bloom in the stove) will admit that its decorative qualities are by no means unimportant. It is a tree, but flowers in a young state, and when only of small dimensions. The leaves are pinnate with twenty to thirty pairs of oblong acute serrolate pinne, each about \(\frac{7}{3}\) to 1 inch long. The star-shaped flowers are deep rosy lilac colour, individually small, but when grouped in terminal, pyramidal, much branched panicles, they have a very pretty effect.

ORNITHOGALUM REVOLUTUM

Is in bloom in the Heath house at Kew. It is somewhat like O. arabicum in habit, but the inner surface of the perianth segments is rich elive coloured, deeply margined with white. It is a native of South Africa,

NEGLECIED CREEPERS.

Among the many beautiful and striking creeping plants which adorn the Water-Lily-house of the Royal Gardens, Kew, at this time are Thunbergia grandiflora, with magnificent white tubular flowers; Solanum Wendlaudi, the finest of the Solanums, so fine, that the epithet majestic is hardly out of place. S. Seaforthianum is smaller, but very beautiful. It is stronge that gardeners have not found out these two Solanums. One of the most singular plants to be seen now in this house is Mucuna atro-purpurea. Its flowers are so dark that they resemble in size, form, and colour bunches of black Grapes. The leaves are trifoliolate, as in the Searlet Rinners, the leaflets oblong, pointed, glabrous. It is a native of southern India, Malacca and Ceylon.

CYPHOMANDRA FRAGRANS

Is now in bloom at Kew in the Temperate-house. It is a tree with ovate acuminate, dark green leaves, and pendulous racemes of campaunlate flowers, each about 1 inch long, at first of a rich violet-colour, afterwards becoming olive-coloured.

THE PALM-STOVE.

The substitution of turf for gravel on the terrace ou which the Palm-stove is placed is a vast improvement. The little bays between the projecting buttresses on the outside of the building are now filled with Crinums, fine foliaged Aroideæ, Encomis of gigantic size, and other plants of interest.

HELMHOLTZIA GLABERRIMA.

Not many of our readers are, we expect, conversant with this plant. It is a native of some of the Pacific Islands, and is a tufted plant, with dense in teses of sword-shaped leaves, somewhat after the fashion of

those of the New Zealand Flax, but of a deep green colour, with a prominent mid-rib. From their centre rises a tall pyramidal panicle of ivory-white flowers, individually small, but effective in the mass. The structure of these flowers is very interesting botanically, and shows the plant to be a near ally of the Philydrum, a small stove aquatic of very different habit, and a botanic garden curiosity, whilst the Helmholtzia ranks with Dracconas in decorative character

PAULOWNIAS, ETC.

A magnificent effect is produced at Kew by a bed of these plants. The stems have been cut back to the level of the ground, or nearly so. Strong shoots with noble leaves have been formed in consequence, and they form a noble picture, worthy of imitation wherever space is available. A similar bed of green and purple Ricinus is also very effective, but is too close to the Palm-stove to be seen to full advantage.

TEA ROSES AT KEW.

At this late period of the season it is delightful to see how well the beds of hybrid teas and teas look. Among the best are Grace Darling, Camoens, Fell-nberg. Years ago there was an impression that Roses would not, or did not, do well at Kew, but that impression is now wholly obliterated.

REMARKS ON THE FRUIT CROPS.

(See Tables, pp. 124 to 131.)

(Continued from p. 185.)

5. SOUTHERN COUNTIES.

KENT .- Early spring gave great promise of immense crops of fruit of all kinds, but frosts and cold winds during the blooming period did much damage to Apples and Black Currants. Amongst the large number of varieties of Apples here, the best and most reliable kinds are Irish Peach, Golden Spire, Ecklinville, Lord Suffield, Keswick and Lune's Prince Albert. These farieties have hardly ever failed here. Amongst dessert kinds, Early Juneating, Lady Sudeley, Worcester Pearmain (must be eaten almost as soon as gathered), and Irish Peach seldom fail to eron. There are many others, such as Mr. Glad stone, Cox's Orange, and Cockle Pippin, and that highly flavoured late variety, Adam's Pearmain, one must recommend, but they are not such reliable croppers in my experience as are the former. Plums are a very poor crop, and Damsons little better. Pears are fairly good. We are now gathering Colmar d'Eté, and a delicious Pear it is if gathered and caten direct from the tree. I would add that Rivers' Early is one of the most satisfactory sorts to be grown. It is a good cropper, and has a splendid constitution. The fruits are good in colour, size, and flavour. Ino. Woodward, Barham Court Gardens, Maidstone,

—— The fruit crop this season is the smallest we have had for some seven years. Apples and Plums are especially poor; Gooseberries and Red Currants are an average crop, and the fruit is good; but Black Currants are very scarce. The season has been remarkable for persistent attacks from pests, in spite of repeated washings. Champion Bros., Mereworth, Maidstone.

— Apples in this district are almost a failure this season, and the trees in many instances are much damaged by insects. Plums and Damsons were badly infested with aphis until the recent storms, but the crop in general is heavy. Cobnuts, of which many acres are grown in the neighbourhood, are heavy and exceptionally promising. G. Fennell, Febrlawn, Toubridge.

MIDDLESEX.—There was promise of a grand Apple crop early in the season, but owing to drought many of the froits have fallen. Most of the Codlin varieties, however, are now heavily laden, King of Pippins has much above an average, but many of the late keeping varieties are under average, though the fruits are good in spite of persistent attacks from insect pests, which have required much attention. A few varieties of Pears are cropping very freely. Cordontrained trees have good crops. Pitmaston Duchess, Louise Emme of Jersey, and some half-dozen others,

are bearing grand crops, but in the case of some varieties the crops are very poor. Plums are irregular, many varieties bearing poor crops, but drought has affected them. Cherries of all kinds are very gool, and I never saw better crops of Peaches, Nectarines, and Apricots; the fruits promise to be a good size, and the wood is clean and good. Small fruits have suffered much on our light soil from heat and drought. Raspberries bore a wonderful crop, but the fruits were not large. Strawberries were very good, after watering and mulching, but we rely upon young plants. G. Wythes, Syon House Gardens, Brentford, W.

--- Apples produced an abundance of bloom, but the crop is only an average one, much of the bloom having set imperfectly, or not at all. Prince Albert, Cox's Orange and King of the Pippins, Stirling Castle, and Lord Grosvenor being among the best cropped. Pears did not bloom well at all. Of Plans there is an abundant crop on the walls; bush trees were robbed very much by the birds. Morello Cherries have a heavy crop; sweet Cherries only a light one. Peaches and Nectarines set very well indeed, and are good. Apricots do not usually grow well here, and this year they are a light crop. Gro. Ringham, Wrethum Park traviens, Barnet.

— The prospects of an excellent fruit crop were good early in the season, but the heat and drought combined caused a very large proportion of the Apples and Pears to fall prematurely. Cherries and Apricots dropped largely also, S. T. Wrught, Royal Hortwellweal Society's Gardens, Phiswick.

SURERY. -The great bloom of the spring, seen on all fruit trees, has not been found the precursor of fruit generally. It is not unfrequently the case: a big bloom does not always indicate fertility. We had too, at the blooming time, cold nights, with several keen frosts, followed by drought, which greatly encouraged fruit dropping and the development of insect life. Altogether, fruit trees generally have had a bad time of it. Fair crops of Apples, Pears, and Plums may be seen here and there, but they are few. The Apples and Plums have not swollen well, but Pears have done better. Bush fruits seem to have been generally very good and Strawberries have been better than was anticipated. Peaches and Nectarines, outside, are good crops, but needing ample watering. Apricots are thin. Walnuts are generally a great crop, but small Nuts are the reverse. 1. Dean, Kingston-on Thomas.

The earliness this season of stone fruit has been remarkable. Amsden June Peach was ripe in the last week of June, and Alexander Peach and Early Favourite Plum in the first week in July. Aphides and red-spider have been very troublesome, and there is a veritable plague of earwigs. Educard Burrell, Claremont.

- In this district there has never been such a failure of Apples, Pears, and Plums during the twenty-five years I have spent here, and seldom has there been a greater quantity of bloom than there We suffered little from spring frosts, was in spring. but the exterpillar quite denuded the trees of foliage and of fruit. The trees in June were almost as barof foliage as in February. It is impossible to successfully fight the caterpillar, for Oak trees are so abundant, that the grubs so n infest the fruit trees after cleansing them. From our terrace may be seen about 1000 Oaks quite bare of leat in June, and each season the devastation is extended by miles. Only some natural remedy will avail. In my opinion, a severe October frost would kill the female moth when laying her eggs. Strawberries, Gooseberries, Raspberries, and Currents are, or have been, excellent. A. Evans, Lythe Hill, Hislemere. [Does the same kind of caterpillar attack the Oaks and the fruit trees ! Ep.1

—— Of Apples, the following varieties have heavy crops, Warner's King, Stone's, Prince Albert, Duchess of Oldenburgh, Ecklinville, Lord Grosvenor, and Tower of Glamis. The tollowing dessert varieties have average crops, Cox's Orange and Blenheim Pippins, and Brownlee's Russet. Raspberry Superlative has been very good. The crop of Strawberries was under average and soon past. C. J. Saller, Woodhatch Ladge Gardens, Religible.

SCRREY.—All fruit trees in this district blossomed remarkably well, but a succession of slight frosts in the beginning of May caused many of the flowers to fail. Red-spider, green and black-fly, and caterpillar have been most troublesome during the continued drought. Some Apples are a full crop, notably Keswick Codlin, Lord Suffield, Stirling Castle, Lane's Prince Albert, and Bismarck. I have never before seen heavier crops on the Crab trees, especially the Siberian. Pears are more plentiful than last year. Damson trees are heavily laden, but the foliage has suffered from the attack of insects. Gooseberries are scarce. Black and Red Currants are plentiful. Cobuuts and Filberts are most promising. G. W. Cummins, The Grange, Wallington.

— In our heavy soil all small fruits have done well, with the exception of Raspberries, which were small. Cherries on walls, protected from birds, were very fine. Apricots, Peaches, and Nectarine-trees are clean, and! making good growth. They have splendid crops. Peaches and Nectarines will be of good size and quality. J. W. Meller, Rushin Lodge tired as

Sussex.—The fruit crop in early spring promised to be one of the most abundant on record, but May frosts injured the fruits severely in this district. Gooseberries were a splendid crop, but neither Black nor Red Currants were plentitul. Some of the more hardy varieties of Plums, as the Czar, Victoria, Early Rivers, and Diamond, are good. The same may be said of Apples; trees, however, that bore an abundance of fruit last season have none this. Cherries have been an abundant crop, and Pears are quite up to the average. H. C. Prinsep, Buxted Park, Tekpield.

- The following varieties of Apples are bearing the best crops—Lord Suffield, Cox's Orange Pippin, Lane's Prince Albert, Blenheim Orange, Old Nonsuch, Warner's King, Stirling Castle, and King of the Pippins. Of Pears Williams' Bon Chrétien, Louise Bonne of Jersey, l'itmaston Duchess, Doyenné d'Eté, and Jargonelle, are bearing best crops. Strawberry Royal Sovereign has been excellent here, both in pots and out of doors: plants are suffering much for want of rain. E. Bucherry, Castle Gardins, Acandel.

Apples carried a quantity of fine bloom, but in a large measure it failed to set. Pears are fairly good, and the fruits appear to be of good quality, especially Williams' Bon Chrétien, and Marie Louise. Of Plums, Victoria, Kirke's, Coe's Golden Drop, and Jefferson's, all carry good crops. Strawberries have been a grand crop, both in quantity and quality, and there were fine fruits of Royal Sovereign, Sensation, and Noble. The first were ripe on Jane 2. Charles II. Jones, Ob. Hall Gardens, Bargess Hill.

— The foliage of Peaches and Nectarines was badly blistered in the early part of the season, but the trees are now healthy and carry good crops. There is a good crop of Apples on young trees, but very few on older ones. E. Parker, tiondwood, thich str.

Apples and Pears are very poor indeed. Cherries were loaded with good fruit. Our trees were never better, and they are quite clean. We used Strawson's Antipest Knapsack and Bentley's Liquid Quassa Extract. Gooseberries were very pleutiful, and Rispberries also. (c. Duncan, Warnham Court Gardens, Horsham.)

WILTSHIRE.—All fruit crops in this district are good. The crop of Strawberries was of rather short duration, owing to the great drought and heat. This was especially felt in the case of plants growing in light soil. Peaches, Nectarines, Apricots, Cherries, Green Gage, and other varieties of choice Plums, Apples and Pears and bush fruits are satisfactory in every respect, with the exception of Apple trees in light shallow soils, which have dropped their fruits freely. H. W. Ward, Longford Casth, Salishary.

— The fruit crops generally are good, but insectpests have been very troublesome. Our first Peaches were gathered from open walls on July 6: the variety was Waterloo; Plums, Rivers Early, on July 2: and Apricots on July 4. To challis, The Gardene, Wilter House

7. ENGLAND, N.W.

Lancasher.—Apricot trees have a good crop, and the fruits are fine. Peaches and Nectarines are not so numerous, but the trees are making excellent growth, and are very clean. Plums are a failure. Apples and Pears had an extraordinary show of bloom, but owing to the long drought and hot weather the Pears have nearly all fallen. Apples are a good average crop, and look very clean, the fruit being good. Strawberries were good, but soon over. R. Doc. The Gardon's, Knowsley.

Westmoreland.—Owing to the hot and dry weather during May and June, the Apple crop suffered much from magget. In many instances the leaves were quite riddled, and the growth crippled for the season. Cherry trees are very clean, the fruit was fine and of good flavour. Strawberries have been very good, and those that were well mulched and watered have lasted a long time. We commenced to gather ripe fruits fully ten days earlier than we have done for several years past. F. Clarke, Lowther Castle Gardens.

8. ENGLAND, S.W.

CORNWALL. — Strawberries in some places were a total failure, owing to the dry weather. Gooseberries, Raspberries, and red and white Currants were very plentiful; black Currants scarce. Of Pears there are very few. Damsons and Plums are an extra good crop. The Apples are an average crop, and look fairly well. Until the end of July, the rainfall for the year was only 7 inches. II. II. Bennett, Menabilly.

— The Apple crop in East Cornwall is under average. Cold east winds, when the trees were in bloom, had a blasting effect upon exposed trees. Strawberries have been the crop of the year. We commenced picking Vicontesse Héricart de Thury from the open on May 26. This variety was closely followed by Laxton's Noble and Royal Sovereign, and the crop ended with Latest of All on July 14. Bushfruits are abundant and good. Pears are an average crop, and the fruits are swelling well. Until recently, we have had very little rain since April, but owing to a strong soil, we have not suffered much from the drought. Chas. Page, Boromov Gardens.

—— During the first half of the year the rainfall was nearly 6 inches less than in the same period in 1887. I have never known thrip, red-spider, greenfly, caterpillar, and mildew so rampant and destructive to fruit and vegetable crops as this season. Apples set well, but more than one half have fallen, and the remainder will be very small. Peaches are a grand crop, but the trees have entailed an enormous amount of labour in watering and syringing. Peach Early Beatrice was gathered out-of-doors on June 26. W. Sangwin, Trelissick, Truro.

Devonshire.—The fruit crops in this district have suffered considerably from the drought. All kinds of fruit trees bloomed profusely, but set badly. Apples are thin generally, and the fruits will be small and inferior. Pears are an average crop, but small. Strawberries were almost a failure. Plums are irregular, some varieties being plentiful, others, notably Green Gages, none. All fruit is ripening somewhat prematurely, and is consequently of inferior quality. Trees much infested with insects, and making little growth. A. Eames, Heanton Satchville, Benjord, North Devon.

— The early promise of fruits was favourable, as the mild winter was followed by a bright and pleasant spring, and all trees flowered well and set fruit freely. The drought, however, has caused the fruit to shrivel and fall, and that which now remains is poor. The birds would seem to have been more destructive than usual, and if nets had not been used freely, but little small fruit would have been gathered. W. Swan, Bystock Carleys, Exmouth.

GLOI CLETTARSHIRE. The Apple crop in this district is much under average, and in many places it is a complete failure. The few Apples that are to be found, are the commonest varieties, which last year were allowed to remain ungathered. It will not be so this year—Peaches and Necturines were never

better, either in growth or fruit. Nuts are most abundant, and bush fruits also. Thomas Shingles, The Gardens, Falfield.

The promise of the fruit crop was even better in spring than that of 1895, but the frost of May 2 and 3, together with the great drought, has had a prejudicial effect. The trees in these gardens are free from insects generally speaking, but the Cherries were affected by black-fly earlier in the season. The fruit of Apples and Pears will probably be small. There are complaints from some gardens of the Apple-weevil. T. E. Arnold, Circucester House.

(To be continued.

METHODS OF PROPAGATION.

Continued from p. 159.)

Budding.—In my paper on fruit-tree grafting I alluded to the universal plan of budding in the summer, and afterwards grafting all the stocks where the bud had not taken. There is little more to say on this head, except that Apples, Pears, and Plums, on whatever stock, are budded a few inches from the ground line, while Cherries are usually worked standard high, unless the operator wishes for dwarf trees. As a rule, clean straight stems result from this plan, well adapted for orchard standards; and when on dwarfing stocks, to form the useful and popular "amateurs' standards," which combine in one tree a cordon and a standard.

PEACHES, NECTARINES, AND APRICOTS.

One class of fruit tree is universally budded in British nurseries, though in America and elsewhere it is increased by grafting—I allude to Peaches, Nectarines, and Apricots. The first two should be budded low on the Mussel Plum stock in July or August, and either left where they stand or lifted early in the autumn, and lined up for convenience of training, great care being taken to get out all the roots uninjured. If left where they are, the growth from the bud the following season is frequently too coarse and sappy, and this wood not maturing is very apt to be damaged by frost in the winter; for this reason too high culture is not advised-the end to be desired is fine but ripe growth. The knife may he used to advantage to remove all superfluous branches, that the sun's rays may enter, and so mature the wood left. Most of the Apricots do on the same stock, but they are also budded on the Brussels and Brompton stocks, and require the same treatment as the first-named; but in budding, the cross cut should be used, as it facilitates the operation. Quickness and lightness of touch are essential, as bruising the wood or bark too frequently causes "gumming," which is very prejudicial.

As the trees of these esteemed stone fruits are mostly required for walls, they are pruned (or "educated," as it is aptly termed in nurseries) accordingly. They are easily trained flat when they have made their summer growth, after being cut back in the winter somewhat hard. There is great difference in the opinion held by knifemen upon this point, some cutting back very close to the stock, others leaving some inches of the lateral growths unpruned. As in most processes connected with horticulture, wisdom here lies in the "happy medium," and I will say, though I closely prune, the other plan may sometimes be better.

The next operation is what we call training, and is effected in nurseries by placing a lattice-work of stakes by the side of the tree to be trained, either diagonally, or in a rectangular fashion, but in gardens the process may be done on the walls or feuces, where there are any available. A few may be left to be trained as pyramids for pot-culture in the orehard-house or Peach-house. Leading nurserymen have for the last few years, following the lead of my late lamented friend. Thomas Rivers, exhibited some well-fruited specimens of this type of tree, the art here consisting more in securing a thoroughly ripened wool than in any particular method of training-Avoid crossing the branches, and crowding the shoots, endeavouring to admit all the air and soulight into your

tree possible, and there will be then reasonable expectation of a crop of fruit on even two years old trees.

MAPLES, ETC.

Besides Roscs and fruit trees, the various trees and shrubs required to decorate our gardens and parks are conveniently propagated by budding. One of the most useful and desirable is the variegated Ash-leaved Maple (Acer Negunde variegatum). It may be budded standard high for standards, or for dwarfs and pyramids, as near the ground line as convenient. This may be done as soon as buds can be taken from the variegated form, and the sap is well up in the stock, which should be the normal green-leaved A. Negundo. The buds may be inserted in lateral branches, as in Rosebudding, or directly into the young wood of the main stem, but on stems not more than 4 to 5 feet high the best heads form, and as the tree is naturally of an crect habit of growth, this height will be found sufficient.

A French firm recommend the golden variegated form for light soils, and state (which is true) that it is more vigorous, does not scald in the eun, and is almost as effective. This is certainly the better of the two for standards, but for dwarfs use the old silver form. The bark of A. Negundo being very tender, I recommend the cross-cut in budding, and advise the operator to be very cautious not to bruise the bark, or allow it to dry, when inserting the bud. Bind with raffia, and examine from time to time to see that the tie does not cut into the bark. This is a most useful shrub, and dwarf and pyramidal plants may be potted for cool conservatory work, or for the winter garden, when gently forced. Associated with any of the ordinary dark foliage plants as Lobelia Queen Victoria, the crimson-leaved Beets, or perhaps still better with the Purple Giant Orach (Atriplex hortensis purpurea), it makes a strikingly handsome bed, or if a permanent bed be desired, plant the purple-leaved Plum (Prunns Pissardi) alternately with them. This desirable foliage Plum may be raised easily by budding into any of the Plum stocks mentioned in the article "Grafting," or it may be budded standard high in a Mussel stock, or close to the ground line on the Myrobalan (Prunus myrobalana), for dwarfs, and pyramids, the best form for pots.

The plan of budding on established trees, is often convenient and desirable, but requires judgment. While we are among the Maples, a tine effect may be compassed by putting a few buds of the Corstorphine Plane, or Syeamore (A. pseudo-Platanus foliis aureis), into tho branches of a common Sycamore. These, if eacouraged, and the branches of the stock tree are kept thinned, grow up and give a most telling effect, this being much enhanced by planting trees of the purple-leaved Sycamore in close juxtaposition to the golden one, or budding both on the same stock tree. Indeed, there seems no limit to the amount of variety that may be introduced into the shrubberies, for not only have we among this genus many handsome variegated and finely-coloured leaves, but some of great excellence in the conspicuous variation of their foliage, note the deeply laxiniated form, Heldreichi, or the very vigorous light-green kind known as A. Lobeli, of all of which buds may be procured from high-class nurseries.

Lest our American cousins should feel slighted, I will just name two among Virginian Maples which may be budded on the Norway Maple (Acer platanoides), and which should claim a place in our Arboretum were it only for the fact of their giving us such lovely tints when they are about to shed their leaves in the autumn. Among these, the Eagle's Claw Maple (A. heterophylla laciniata), and Vier's elegant cut-leaved kind are worthy of cultivation.

THE ALDER.

Even the lovely Alder gives us some useful forms. Almus cordata grows to a handsome tree: a good example used to adorn the Exotic Nursery, Canterbury, while the Imperial Fern-leaved variety, alluded to in my article on "Layering," budded standard high, makes a pretty lawn-tree, and there is a lovely pendulous-branched sort of the the silvery "incana"

which, for a moist situation, gives us a weeping tree superior to the Ash. The right stock for these is the common Alder (Alnus glutinosa), on which it buds freely.

ROBINIAS.

The Mock Acacias, touched on in the article on grafting ornamental trees, may be budded, though not easily, the safest plan being to "eyegraft" them, that is, leaving the wood in the

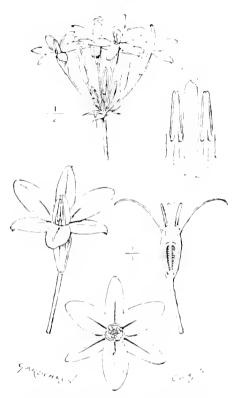

Fig. 36.- erodiāta grandifiera.

Umbel half the size of nature; flowers violet-blue, natural size; two stamens and one staminode magnified two diameters.

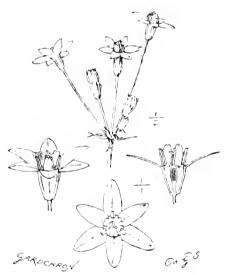

Fig. 38.—BRODLÆA STELLARIS.
Umbel half-size; flowers read size, reddish purple

shield of the bud to accurately fit this into a notch cut in the stock, which in this case should be the common White Acacia, and bind up tightly and securely with raffia, smearing on a little clay or grafting wax for further security. Decaine's and Desson's handsome flowering hybrids are the best, while the Rose Acacia, the finest for blossom, may be worked about 4 feet high, when an elegant drooping tree will result. Acacia Bessoniana makes a lovely avenue in sheltered positions. Experience.

THE GENUS BRODLEA AND ITS ALLIES.

[During the present summer, Messrs. Wallace & Co., of Colchester, have exhibited a series of specimens of Brodica, and allied genera, at successive meetings of the Royal Horticultural Society. The specimens were kindly entrusted to us, and were so numerous that an excellent opportunity seemed to be presented of securing illustrations, which might serve to render the genus better known. The descriptions, and the classification, have been kindly undertaken for us by Mr. J. G. Baker, F.R.S., who has made a special study of the petaloid Monocotyledonous plants. The drawings have been made by Mr. Worthington Smith. The inflorescence is, in almost all cases, shown of half the natural size; the individual flowers, and section are shown of their real dimensions, whilst the details relating to the stamens are magnified two diameters. As to cultivation, a sunny, well drained border, and light rich soil, suits them well, or they may be grown in pots in an ordinary greenhouse. ED.]

There is a considerable number of fine American bulbous Liliaceie, nearly allied to one another, many of which have been introduced into European gardens, which have been classified so differently by recent authors, that their nomenclature is in a state of great confusion. The older authors, Cavanilles, Smith, Lindley, and Kunth, defined a large number of genera, of which the principal are Milla, Brodiaca, Triteleia, Calliprora, Hesperoscordum. Dichelostemma, and Senbertia. When in 1870, 1 monographed the gamophyllous Liliacere, in the eleventh volume of the Journal of the Linnean Society, 1 merged all these genera into two, Brodiæa, characterised by having three out of the six stamens imperfect, and Milla, in which all the six are uniform and fertile. In 1879 Dr. Sereno-Watson worked out again the North-American species, and classified them upon a different plan. All the genera abovenamed he merged in Brodina, except Milla, which he kept up as distinct for the single Mexican species on which Cavanilles founded it. This latter plan was followed by Mr. Bentham in the Genera Plantarum, and consequently in the Index Kewensis. But as Dr. Watson dealt only with the North-American species, those that inhabit South America have never been described under Brodian, and, consequently, still stand under Milla in the Index Keicensis. In 1886, Mr. James Britten, in the Journal of Botany, pointed out that Hockers of Salisbury is an earlier name than Brodiæa of Smith. According to Kuntze, Salisbury's name was published in March, 1808, and Smith's paper was read in April, 1808. and Kuntze in his Revisio to ne cam enumerates under Il lokera all the species described under Brodiea and Milla by Dr. Watson and myself, with the exception of M. uniflora. In 1886, in the Bulletin of the Californian Academy, Dr. Greene published a valuable paper, in which all the North American species are carefully described, and several new ones added. For the old series of species he recognises three genera...-Hookera, Brodiæa, and Triteleia; and he describes a curious new genus under the name of Behria. Unfortunately, this paper was just too late for the new species to be included in the Indee Kewensis. What I wish to do now, however, is not to discuss nomenclature, but to enumerate and classify the species as they now stand, taking Brodiana in the sense in which it is understood and described in the Genera Plantarum.

BRODLEA

SERIES I.— Perfect (antheriferous) stamens three only, the three others being represented by staminodes.

Group 1.—Umbels lax. Flowers comparatively large. Tube of perianth firm and opaque (Hookera, Greene).

1. **B.** grandiflora, Smith (*Hookera coronaria*, Salisb.)—The original type species, which is widely spread through California, Oregon, and Washington territory. Flowers bright violet-blue, three to ten in an ambel, 1 to 1_4^+ inch long, with segments rather

longer than the tube. Figured Bot. Mag., t. 2877 (see also fig. 36).

2. **B.** californica, Lindl. (Hookera californical Greene). — Very near B. grandithera, but with a longer scape, ten to twenty-five flowers in an umbel, which are $1\frac{1}{2}$ to 2 inches long, and vary from rose colour to deep purple. The finest of all the species for garden purposes (fig 37, p. 215).

Upper part of the Sacramento Valley.

3. B. minor, S. Wats. (Hookera minor, Greene).— Near B. grandiflora, but slender scape only 3 to 6 inches long, two to six flowers in an umbel; flowers an inch or less long, with a more spreading limb.

Southern California.

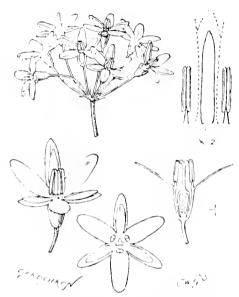

Fig. 39.—BRODLEA ROSEA. Umbel half-size; flowers real size, rose red.

Fig. 41 - FRODIAA CONGESTA.
Umbel half-size; flowers real size, violet.

4. **B.** terrestris. Kellogg (*Hookera terrestris*. Britten and Greene).—Umbel sessile on the ground, two to ten-flowered. Perianth less than an inch long, with a spreading limb. Staminodia yellow, with involute edges.

Near the coast. San Francisco, northward to Oregon, 5. B. stellaris, S. Wats. (Hookera stellaris, Greene).—A very rare species, discovered in Mendocino county in 1881, by Mr. Carl Furdy. Leaves subterete. Peduncle 2 to 6 inches long. Flowers three te six in an umbel, under an inch long, reddishputple. Authers with an oblong wing behind. Staminodia longer than the stamens, white, emarginate. It has not previously been figured (fig. 38).

6. B. leptandra (Hookera leptandra, Greene, Pittonia, 1,74.—Pedunde I foot or less long. Umbel 2-flowered; pedicels I to 3 inches long; perianth purple, I inch long; segments four times the length

of the campanulate tube. Filaments and authers each 1-inch long: staminodes pale, thin, retuse, involute, a little longer than the anthers.

Calistoga, California. Discovered in 1887 by the late Dr. Parry.

7. B. rosea (Hookera rosea, Greene). - Leaves subterete. Peduncle 3 to 6 inches long. Flowers five to eight in an umbel, under 1 inch long, rosered. Free portion of fertile filaments dilated; stamiuodia white, ligulate, obtuse, entire, rather longer than the anthers (fig. 39, p. 213).

Discovered in Lake County in 1884 by Mrs. Curran,

and lately introduced by Messrs. Wallace.

8. B. filifolia, S. Wats. (Hookera filifolia, Greene). -Leaves slightly flattened. Pednucle ½ to 1 foot Flowers three to six in an umbel, dark, to 3 inch long. Anthers nearly twice the length of the triangular staminodia.

There are specimens in the Kew herbarium collected in the San Bernadino Valley by Dr. Vasey and Mr. W. G. Wright, but I have not seen it alive.

9. B. Orcuttii (Hookera Orcuttii, Greene).-Peduncle stout, 1 foot or more long. Leaves linear, not terete, flat or conduplicate. Flowers five to fifteen in an umbel, under an inch long, bright lilac, with a very short tube. Filaments longer than the anthers; staminodia reduced to a small triangular scale.

Discovered by Mr. C. R. Orentt in 1884, in San Diego country, and recently introduced into England by Messrs. Wallace. It has not been previously figured (fig. 40, p. 215).

Group 2.—Flowers much smaller and more tender than in the last group, many in a dense umbel. (Brodiaa, Greene, pro parte).

10. B. multiflora, Benth. (B. parridora, Torrey and Gray).-Flowers six to twenty in an umbel; pedicels short or obsolete. Perianth blue, 8 to 10 lines long; segments oblong, as long as the tube. Anthers sessile; staminodia lanceolate, entire.

Central California to Oregon and Utah, in the mountains. Figured Bot. Mag., t. 6598 and Gartendora, t. 752.

11. B. congesta, Smith Dichelostemma congesta, Kunth).—Leaves subterete, evanescent. Peduncle 3 to 5 feet long, flexuose. Flowers six to twelve in an umbel, deep violet, sessile, or nearly so. l'erianth 8 to 9 lines long; segments about as long as the tube. Authers sessile: staminodia bifid, purple, spreading with the segments of the perianth.

Central California to the borders of British Columbia, amongst the lower hills. Exactly resembles Hookera pulchella, Salish., t. 117, but that has six fertile stamens (fig. 41).

This finishes the species of the first series. I must reserve till another issue, the account of those with six perf. et anthers. J. G. Baker.

(To be continued).

THE HARDY FLOWER BORDER.

STATICES.

In such a season as this, when July flowers were past before their usual time, and when summer Phloxes have narrowly escaped failure through drought, one naturally looks round to see what tenants of the hardy flower border can be relied upon to make a show in another such season. Several members of the genus Statice, or Sea Lavender, are conspicuous, and seem to enjoy such conditious of weather as have prevailed. I am speaking only of the hardy perennials of the genus; and though I am unable to speak with certainty of the names, I have about half-a-dozen kinds here now in flower which contribute largely to the gaiety of the garden. There is a strong family likeness amongst the Sea Lavenders, and it is perhaps not too much to say that all the hardy kinds are good, whether correctly named or The finest is one I have always grown as S. latifolia, making a large panicle 2 feet high and nearly a yard across, and lasting in flower a long time-in fact, being everlasting, if cut at an early stage. Other names of tall kinds are S. elata, S.

Gmelini, S. Limonium, the last being a native plant, less ornamental than the others. Of smaller kinds, I may mention S. incana, said to be synonymous with S. tatarica. The dwarfer kinds grow readily from seed, and a large number may easily be grown without proving an incumbrance to the flower beds. To do justice to those with spreading heads we must give them ample room to grow without being crowded. This is essential to their ornamental qualities; and it may be remarked in passing, that neglect to provide this necessary room is capable of spoiling the beauty of another plant which is at its best in hot sunny seasons, Gypsophila panienlata. A balloon of this, 4 feet high, and 6 feet through, is an ornament to any garden, but when it is seen struggling to get its head through a mass of tall surroundings, it presents a very ordinary and shabby appearance. C. Wolley God, Edge Hall.

VERATRUM NIGRUM.

This is one of the best fine-foliaged hardy plants we have for use as isolated specimeus on grass. If planted near the edges of shrubbery borders, or at a safe distance from clumps of shrubs, it has a very fine effect all through the early summer months by reason of the foliage alone; but this is increased when its spikes of flowers open. They last in good condition from two to three weeks, and stand erect and stately without need of tying. The flowers are of an unusual colour, being very dark brown. The plant prefers a somewhat shady and moist position, and is by no means difficult to grow, if it gets a fair amount of moisture and nourishment. W. H. Divers, Belvoir Castle Gardens.

THE BEDDING IN HYDE PARK.

THE flower-beds near Park Laue have looked charming recently, and the rains have encouraged growth and given the plants a fresher appearance. The cooler weather has also had a beneficial influence upon the plants. The system of blending is a great improvement upon the formal carpet bedding which was once so popular, as it allows of the use of a much greater variety of plants. The whole arrangement of the bedding constitutes au object-lesson to those in a position to turn such an experience to useful account.

To refer to some of the beds noted on a recent visit, we saw one filled with Fuchsias, some plants of the yellow Calceolaria amplexicaulis, and Tiger-Lilies, with a ground-work of Alternanthera within a band of the golden Lysimachia. A bed of Palms arranged thinly on a carpet of Alternanthera versicolor, having some smaller plants of Tuberous Begonias and Chamapeuce diacantha peoping out from amongst them, surrounded by a band of Alternanthera amoua proved an effective and pretty picture. A good bed of Lilium speciosum with a ground-work of Senecio elegans produced a novel and pleasing effect. A bed of Godetias in various colours looked well at a nearlier date, but the hot, dry weather caused the plants to go off early. A good show is being made with Lilium speciosum album, together with some plants of Ivy-leaved Pelargonium, and a darkflowered Scabious. In the next series there are two beds of white Margnerites, with blue Cornflower interspersed. A pretty sight is promised shortly from two beds of Lilium speciosum, having the yellow Chrysanthemum, Jardin des Plantes, under them. Between these two beds is a charming one composed of Calceolaria amplexicaulis and Campanula pyramida'is, blue and white mixed. The weather has been somewhat against the plants but now they are making headway, and the bed will be a good one during the autumn.

We next note a small bed of Chrysanthemum Gentleness, a pretty pink-flowering variety, which has succeeded Carnation Montague. Arancaria excelsa above a ground-work of mixed Pansies is novel and pleasing.

The two adjoining beds were lately filled with Carnations. These have now been cleared away, and a pretty mixed bed of Liliums, Gaillardias, Maurandya Barclayana, &c., and a carpet of Alternanthera is now seen. The other bed has been filled with Chrysan-

themum Harvest Home, which will make a splendid late flowering bed.

Looking very well was an arrangement of mixed Fuchsias and Campannia pyramidalis with Lobelia cardinalis, having a carpet of Godetia and Begonia Princess Beatrice.

On either side of Mount Street Gate there were two very pretty beds of Bronze Pansies with some "dot' plants of White Marguerites, but these have been succeeded by Fuchsia Scarcity, having some white Scabious interspersed, making a very pretty bed. In the next row of beds, from Mount Street Gate to Grosvenor Gate, are some very good combinations. The extreme beds at either end contain standard Fuchsias, Ivyleaved Pelargoniums, Campanula pyramidalis, Nicotiana adiais, and Papaver nudicaule, the whole making a pretty and varied picture, particularly in the evening. The next pair are full of standard Heliotropes, with Acalypha grandiflora and white Antirchinams, which have done only moderately well owing to the hot weather, but are now improving.

The carpet of mixed Verbenas has been making a good show all the summer. There are next two beds of the beautiful French Cannas; the plants are now coming into bloom, and promise to make a good show. The centre bed of Plumbago capensis has done very well; the mixed Petunias planted under them have created a grand display, the hot, dry weather suiting them well. Near Grosvenor Gate, the extreme bed has Araucaria excelsa, with a groundwork of Legonia Princess Beatrice, and some dot plants of Ophiopogon variegatus, the light green of the Araucaria contrasting well with the pale flowers of the Begonia.

Turning round and glancing at the pair of beds on our right, the first is a round one, and very pretty. It is planted with Carnation Crimson Clove, interspersed with some plants of Lobelia cardinalis and

yellow Salpiglossis.

Fuchsia Scarcity, with a carpet of Ten-week Stocks, in the other one, produces an abundance of bloom and perfume. Crimson Pelargoniums, with a carpet of white Pelargoniums and a band of the bronze Fuchsia Meteor make a good bed. Acacia lophantha, Begonia semperflorens rubra, with Amaranthus tricolor, and Phalaugium variegatum, make a varied display in two other beds. There are two beds filled to advantage with large plants of Fuchsia, Mrs. Marshall, over a carpet of Viola Holyrood.

We next notice a pair containing Tuberous Begonias (crimson), producing a splendid display of bloom carpeted with the golden Lysimachia. A very pretty bed is that of crimson flowering Pelargoniums with the Golden Privet, Francoa ramosa, and Statice Suworowi, with its feather lavender-coloured flowers

Another bed has been planted with Fuchsias and a carpet of Ten-week Stocks, surrounded with a band of Fuchsia Earl of Beaconsfield A very pretty bed is made with Grevillea robusta, Begonia semperflorens (pink), Phalangium variegatum, and Amaranthus tricolor. Two beds of crimson-flowered tuberous Begonias, with a ground-work of Harrison's Mnsk, make a grand show, and a very pretty pair of beds is composed of pink Pelargoniums having plants of the white-flowered Abutilon Boule de Neige and orange-coloured Salpiglossis interspersed. There are two earpet beds near Mount Street Gate; one has a central figure filled with Alternanthera versicolor, with dot plants of Dracenas, Ophiopogons, and Carex europeus, the other with Alternanthera amona, surrounded by Echeverias and Alternanthera aurea, having dot plants of Dracena rubra and succulents.

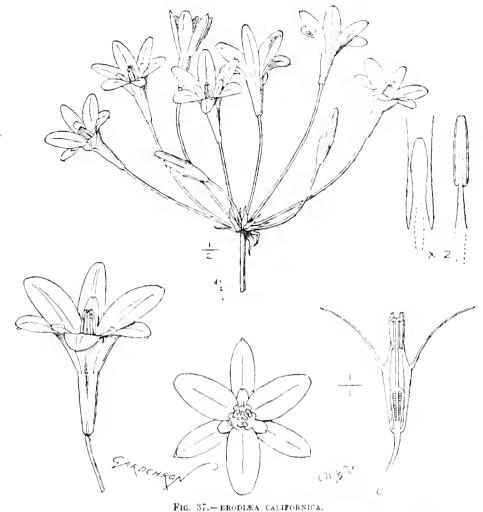

A large circular bed, having Plumbago capensis, Lantana Queen Victoria, and scarlet Tropæolum, and a carpet of Coleus Crown Jewel, looks well.

Two small circles filled with Caphea platycentra, grown into pyramids, and carpeted with Alternanthera, make very pretty beds.

Plants have been put in the grass, consisting of

groups of Bamboos, Eucalyptus, and Palms, and they make an imposing display, which obtains general approval.

A range of beds from Grosvenor Gate to the Marble Arch is filled with Fuchsias, Pelargoniums, &c.,

Umbel half-size; flowers of the real size, purplish; stamens, &c., magnified two diameters. (See p. 2.3.)

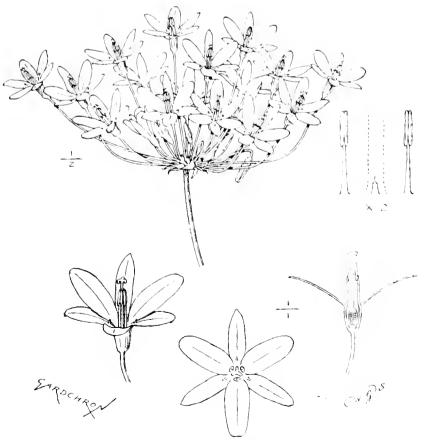

Fig. 40,—BRODLEA ORCUTTIL.
Umbel half-size; flowers real size, lilac; stamens, &c., magnified two diameters. (See p. 214.)

the most conspicuous being occupied by Pelargenium West Brighton Gem, the season having a need Pelargoniums.

Some beds north of Rotten Row near the bands and are filled with subtropical plants, but two have been filled with the hardy Willow-weed, Epilobium a gustifolium, and Lythrum rospum, which have been dowering continuously for the past three months.

The waterfall at the Dell has been improved, the water-space baving been enlarged. Water Lilies and aquatic plants near the margin make it an attractive spot. Mr. W. Browne, the Park Superintendent, may be congratulated upon his tasteful arrangements this season. J. B.

VEGETABLES.

VEITCH'S MAIN CROP PEA.

This has again been so satisfactory with me this season, that I cannot refrain from calling attention to it in the pages of the Gardeners' Chronicle. Its height this year has not exceeded 3 feet. It has maintained its true branching character; the haulm is strong and vigorous, the pods are produced in pairs, in profusion; they are large and handsome in appearance, and contain eight to eleven Peas in each, and they are of excellent colour and flavour when cooked. As a drought-resisting Pea, it has proved itself this season to be one of the very best. It would be interesting to know whether it has done well on hot, sandy ground. Our soil here is a heavy loam J. E., Nostell Priory Gardens.

NEW VARIETIES OF DWARF BEAN.

By hybridising and selecting, Mr. Smythe has been successful in producing as many as six or eight varieties of Phaseolus multiflorus type, but of dwarf habit, and has for two or three years been testing their character, they having in every way fully justified his estimation of them.

Last year I received test samples of five or six sorts, and they have proved invaluable for supplying the wants of the kitchen in this exceptionally dry season. The seeds of each variety are different in colour, as are also the flowers. The racemes are long, and the height of the plant does not exceed 18 inches, the pods being of a beautiful shape, and of a very crisp, fleshy character, and of splendid flavour when cooked. I have been gathering continually since the last week in June, and have now some rows heavily cropped. It is only necessary to compare them with Runner Bean to see the superiority of these novelties over their parents. At the present time there are here eleven rows of Runner Beans, 12 feet high, in the best of health, yet hundreds of racemes with only two or three Beans developed; all the other flowers have dropped nff owing to the dry seison, and hundreds have no Beans upon them at all.

Mr. Smythe tells me he has had, and has now, very heavy crops upon plants of the new varieties he has grown for consumption at Basing Park, notwithstanding there has been no rain there for four months, and the garden is situated on a hill. I have no hesitation in saying Mr. Smythe has raised one of the best strains of Beans in cultivation. I shall grow no other myself when I can get a sufficient supply of seed. G. A. Bishop, Wightwick Manor Gardens.

PRACTICAL FRUIT-GROWING IN AUSTRALIA.

In New South Wales is to be found a practically unlimited field for fruit-growing enterprise, especially on the part of those conversant with the better kinds of fruit, improved modes of cultivation, and proper methods for packing for the home market or for export, the failure of many experimental shipments of Australian fruit to London and elsewhere being largely due to defective packing—It has been roughly estimated that from one-quarter to enethird of the surface of the colony, representing an area of several million acres, is suitable for fruit-growing purposes, the fruits including almost every description grown in

temperate and sub-tropical countries. Yet the total productive area under orchards and fruit gardens in 1895 was only 21,465 acres, the quantity of fruit obtained being far behind the demand for local consumption, and necessitating the importation of considerable quantities from other countries. The value of these imports in 1895 was considerable, that of Apples and other ordinary fresh fruits, principally from Tasmania, being £100,465. The fruits exported from New South Wales consist almost exclusively of Oranges and Lemous, and it is anticipated that in the near future the export trade in these will become largely augmented, as every known variety of these fruits can be grown with ease in the colony; and, besides, the fruit can be delivered in London, Manchester, and other ports during those months of the year when there is no supply from Spain and other countries in Southern Europe. The area under Orange and Lemon trees in 1895 comprised 12,204 acres; the productive area, 9,242 acres; and the total yield, 8,703,252 dozen, or an average of 940 dozen to the acre. It is estimated that ever 3,000 dozen of fruit to the acre can be obtained in an average season from fair-sized trees in full bearing. It is therefore probable that the figures for 1895 included the returns from a considerable number of young trees. Most of the orangeries are situated within a few miles of Sydney-a result, probably, of proximity to the metropolitan market, as there are thousands of acres equally adapted for Orange cultivation in the greater portion of the coastal districts of the colony. The possibilities of Orange cultivation in New South Wales warrant the anticipation that the leading British houses engaged in the marmalade manufacture may see their way, at no remote period, to the establishment of branch works in the colony. The production of candied Citron, Orange, and Lemon-peels, could be undertaken with success by reason, not only of the abundance and cheapness of the necessary fruit, sugar, &c., but also because of there being a fair supply of the requisite labour. All this would have been effected long since, but, as Mr. Coghlan remarks, for "the proverbial antigonism of the Briton to culture of any fruit, cereal, or fabric-plant unknown to the climatic zone of his native land," which "has hitherto injuriously operated against the introduction of many vegetable staples which experiment and experience have amply demonstrated would flourish luxuriantly in Australia, to the advantage both of the individual and of the community," portuge to the Citrus fruits is the Grape, the production of which has steadily increased of late years, the total area planted with Vines being now nearly seven times what it was in the year 1862, when it stood at 1130 acres, of which number Grapes from 562 acres were gathered for wine-making, the total production being 85,328 gallons. The yields for the years 1876, 1877, 1880, and 1892 were the best of the series. The total number of Vine-growers in 1895 was 2054. The average area of each vineyard was 3.7 acres, and the area planted with Vines still in an unproductive state was 744 acres. In 1894, the area under cultivation for table Grapes was 2358 acres, producing 4617 tons of Grapes, or an average yield of about 2 tons per acre. Large quantities of Muscatel and other Grapes could be profitably exported by those familiar with the methods of packing practised in Spain, Portugal, and other countries. So far, no effort has been made in New South Wales to prepare Raisin fruits for foreign consumption, although there exist undoubted possibilities for a large export trade in this direction. Experiments made in drying Grapes and Currants of Australian culture have met with success in the London markets, and experts have declared the product to be of the highest quality. These experiments were made in Victoria and South Australia, but New South Wales is, perhaps, even more favourably situated for the prosecution of this industry than either of the sister colonies, and with the extension of settlement, and the falling out of cultivation of the few products more cheaply grown in other and more suitably climatic parts of the world, the building up of a large export trade in Raisins, Muscatels, dried Currants, Figs, and other staples peculiar to the isles of the Levant and the Grecian peninsula may reasonably be expected.

INDIA.

ROYAL BOTANIC GARDEN, CALCUTTA.

The season from October to March was abnormally dry, and many plants and trees perished or were damaged by the drought. Steady progress has, however, been made in improving the Botanic Garden, not only as a scientific centre for botanical students, but also as a pleasure resert for the public. Several garden roads were repaired, and the new road running from the Shalimar Point to the Garden was opened for traffic by the Public Works Department. The steps leading to Colonel Kyd's monument were renovated and paved with marble; and a cutting from the sacred Bo tree at Budh Gaya was presented by Mr. Grierson, late Magistrate of Howrah, and planted in the garden.

Attention was, as usual, given to the cultivation and distribution of plants of economic value. Among these the Sida, a fibre-producing plant, and the Adhatoda Vasica, a decoction of which is popularly believed to be a powerful insecticide in Tea plantations, were cultivated at the instance of the reporter on economic products. The decoction of Adhatoda Vasica was submitted to a test, but the results are reported to have been of a somewhat doubtful nature.

The collection in the Herbarium was increased by more than 17,000 specimens, the chief contributors being the Director of the Reyal Gardens, Kew, and the Keeper of the Botanical Department of the National History Museum, London.

A gigantic specimen of the beautiful Australian Fern, Todea barbara, weighing upwards of half a ton, was presented to the garden by the distinguished botanist, Barou Sir Ferdinand von Mueller, K.C. M.G., F.R.S.

ORCHID NOTES AND GLEANINGS.

CATTLEYA (LÆLIA) CRISPA.

The largest specimen of this that has yet come under my notice is now in flower in the Orchid-houses of R. le Doux. Esq., Marlfield, West Derby, Liverpool. It is a plant with nearly 300 bulbs, and has a large number of leads, growing strongly on a huge Teak-wood raft at one end of the Cattleya-house. The plant has been in this collection a number of years, and has increased in vigour and floriferousness year after year. At the present time it has ten spikes, each bearing five or six beautifully-marked flowers of large size and substance. It is a credit to Mr. Thomas Archer, the head gardener.

RENANTHERA (VANDA) LOWII

is also flowering in the above collection, and bears a spike over 4 feet long, which is still extending. At the present time there are thirty flowers and buds; this number will be greatly increased before the extremity of the spike is visible. I. I.

THE WEEK'S WORK.

THE FLOWER GARDEN.

By Hedley Warken, Gardener, Aston Clinton, Tring.

GENERAL WORK.—The mowing, sweeping, and rolling of lawns and walks will require a great deal of time and attention. Evergreen hedges that have not yet been clipped, should be attended to without delay. In districts where the rainfall has been moderate only, continue to water recently-planted trees and shrubs. The mulching placed over the roots when planted should not be removed. Propagation should be pushed on as rapidly as possible. Some varieties of Pelargonium have made but little growth, and nost of it late in the season. Select the best cuttings for present propagation, and next month lift the plants and pot them into 60-sized pots, in which they may be wintered. They will then afford an abundance of growths early in the spring suitable for propagation. Lobelias that are flowering less freely than formerly will make renewed growth if all decaying flowers be clipped off the plants. In beds where dot plants have been used, care is neces-

sary that the surrounding plants be kept within their proper limits, so that the outline of the former may be evident. Remove any decaying stems or foliage from the beds frequently, that the beds may be kept in good condition as long as possible. Dahlias, whether planted singly or in beds, will require frequent attention in the matter of securing the growths against high winds. Earwigs are doing considerable damage among Dahlias, and should be looked for constantly. Flower-seeds of any particular variety of plant it may be desirable to save should be gathered as fast as they ripen.

ROSES are still suffering from the effects of the drought, and it is not likely they will afford a great quantity of bloom during the coming autumn. Where, however, the rainfall has been sufficient to thoroughly moisten the roots, or artificial watering has been persisted in, better results may be obtained. The plants may be helped a little by removing all dead or decaying leaves and flowers, and weak or exhausted wood. Where the late growths are already showing flower-buds, in such varieties as Gloire de Dijon, La France, Souvenir de la Malmaison, and other strong growers, these should be thinned out to one or two buds, which will give them a better chance to mature. If it be possible to afford the plants a good soaking with weak farmyard-manure liquid, it should be given them without delay.

ANTIRRHINUMS have this season been exceptionally useful, having produced a wealth of bloom both in beds and borders. For cutting purposes the taller varieties are to be recommended, but for planting in beds or front lines of ribbon borders, the dwarf varieties are preferable (see fig. 43).

ZINNIAS are deservedly popular, as they afford such a variety of colour in the flowers. For small beds or borders the dwarf varieties are undenbtedly to be preferred; but where a bold show of colour is desirable, the tall, large-flowering varieties should be employed.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gardener, Woodside, Darlington.

PELARGONIUMS.—Zonal varieties intended for autumn and winter blooming, having filled their pots with roots, may now be given weak dilutions of liquidmanure from the farm-yard, or an occasional sprinkling with a good fertiliser. A portion of the plants may now be allowed to flower for autumn use, but continue to remove the flower-buds from the others until another month or six weeks has past in order that they may bloom well during winter. These of the Regal type which have finished flowering should be given less water preparatory to their annual rest. At the present time, a quantity may be propagated to form young stock. We generally find that Pelargoniums elder than two years are less satisfactory than younger plants. Take eff the shoots about than younger plants. finches long, and insert them singly in thumb-pots, filled with a light compost of loam, leaf-soil, and silver-sand. The latter should drubble into the hole where the cutting is inserted. If the weather be favourable, place them out-of-doors, but be careful to protect them from rains. As soon as the old plants are sufficiently ripened, they may be placed on their sides, and after a time be cut hard back.

LILIUM AURATUM.—Imported bulbs of this grand Lily can be had so cheaply that it should be grown in quantity. We place one bulb in a 5 or 6-inch pot, and this year they have been exceptionally fine, one of them bearing twenty-two excellent blooms. Obtain the bulbs as early in the season as possible, pot them up in 5 or 6-inch pots, using a compost of good loam and leaf-soil in equal parts, and place a little sharp river-sand where the bulb is to rest. Plunge them in the same manuer as Hyacinths are plunged, and as soon as they are well rooted remove them to a cold frame, and protect from severe frosts.

EUCHARIS. — Plants that have flowered during June and July should be encouraged to make new growth. If this be done now, and the plants obtain a rest early, a good number of flowers may be had by Christmas. As soon as Eucharis plants have finished flowering, we repot any that are starving for potroom, but this is never more than one third of the collection, for if Eucharis are healthy, they ought not to be reported more often than once in three years. The plants bloom best when pot-bound, and those that are repotted seldom bloom freely until the following season. In the case of large specimens of Eucharis that are used for exhibition, it is best to shake them entirely out of the pots, and to separate the flowering bulbs from the weaker ones. They can then be re-

potted separately, and every large bulb will usually produce a spike of flowers. If this bedone, the plants should be almost at rest before the operation is commenced. After the bulbs have been repotted, they must be placed in a warm house to encourage them to make fresh growth. Great care must be exercised in watering. Give them a good soaking with moderately warm water to settle the soil about the bulbs, and then if the plants are sprayed overhead night and morning with the syringe, it will be sufficient until the plants take good hold of the new soil. A temperature of 70° at night, rising to 85° in the day, will suit them well during re-establishment. If Eucharis be grown for furnishing or cutting purposes only, the best system is to pot them into 8 and 9-inch pots. which will easily contain ten or a dozen good After a couple of seasons, each pot may produce from fifteen to twenty spikes of flowers. If the mite should make its appearance, the safest and the only effectual practice is to destroy the plants and commence with a fresh stock.

REPOTTING IN AUTUMN.—Any plants that still require to be repotted before winter must not be given large shitts; a pot one size larger will be ample, unless in the case of very strong growing plants. At this late season of the year it is better not to disturb the roots. First look over the collection, and select all that really require to be done; you will then be able to prepare the various soils best snited to the wants of the different plants, and the work can be more easily carried out.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

CUCUMBERS FOR WINTER.—Seed may be sown for producing plants for winter fruiting, or if it be preferred to raise the plants from enttings, these should be inserted during the early part of September. It is important that the plants should be wellestablished and strong before winter, to crop satisfactorily during the short, dark days. Of varieties suitable for this purpose, a good selection of Telegraph cannot be surpassed. Cardiff Castle is also reliable and good. Plants that have been bearing heavily, and show signs of exhaustion, may now be well-thinned, and the shoots partially cut back, removing all remaining fruits at the same time. away a little of the surface soil, and apply a good top-dressing of fresh rich loam over the roots. Keep the house close and warm for a time, and if the plants are in a healthy condition young wood will soon be freely produced, and a good supply of fruit be afforded through the autumn. As the nights become colder a little fireheat will be necessary to prevent the temperature falling below 65° or 70° to 75° through the day. Syringe and close the house early in the afternoon, but if mildew should put in an appearance, give rather more ventilation, and dust the affected parts with flowers-of-sulphur.

FIGS.—Trees planted out in houses frequently make an abundant growth instead of fruiting satisfactorily, the result, probably, of an unlimited root-run: where this is the case, root-pruning and a restricted rooting area are the proper remedies, and they should be carried out as soon as the foliage gives indications of becoming fully matured in the autumn. If the drainage be not perfect, it should be made so, and a proper fall and outlet provided to carry off surplus water, 9 inches or a foot of chalk or brickrubble being placed over the bettom, with a few inches of finer material at the top, to prevent the drainage becoming choked with the finer particles of soil. If the old border be fairly good, it will not be needful to remove it, but if it be deficient in calcareous matter, simply mix in a sixth part of old lime and mortar rubbish, or chalk broken fine. The width of the border may be determined by the height of wall or trellis, from 4 to 6 feet being in most cases ample; the depth of soil should not be more than 24 inches, and in replanting take care to ram the compost firmly about the roots, this being conducive to the production of short-jointed and fruitful wood.

MELONS.—Plants for the latest crop having been planted out, should be encouraged to make a stout sturdy growth, by attording them plenty of light and ventilation, with a temperature of 65° to 70° at night, and 70° to 75° by day, with an increase of 10° by sunheat. Plants swelling their fruits in pits and frames need careful attention now in watering &c.,very little water being required after this date, especially where growing on heaps of manure. Sprinkle overhead only on fine afternoons, withholding this altogether as soon as the fruits give indications of

ripening. Maintain a good warmth by frequent renewal of the linings, and keep a little air on constantly.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

MILTONIA VEXILLARIA having commenced to grow should now be repotted, for this species when in full growth needs such large quantities of water that by the end of the season the compost has become exhausted. Make quite sure that they are perfectly free from insects, small yellow thrips conceal themselves low down in the growths, and it is exceedingly difficult to eradicate them with either brush or sponge without injuring the tender growths. The most effectual remedy is to dip the plants into some safe insecticide. The mixture may remain on the plants for several minutes, during which time they should he laid on their sides, that the insecticide may drain off from the base of the plant to the tips of the leaves instead of into the roots, then thoroughly rinse it off in clear soft water at a temperature of about 80. Another method is to dust sulphur or fine tobaccopowder well down into the growths; this will drive them on to the surface of the leaves, and then by using the XL All Vaporiser they may soon be destroyed. After the plants have been cleansed it is necessary to shade them from strong sunlight for a few days. When reporting a plant turn it carefully out of the pot, and pick out all the decayed compost, and cut off all dead roots. M. vexillaria being a surface-rooting plant, it does not require much depth of soil. The pots or pans used should be rather large, in proportion to the size of the plants, and to about threefourths of their depth, fill them with clean crocks, then to preserve the drainage place a thin layer of sphagnum-moss upon it. Elevate the plants well above the rim of the pot, as by so doing additional rooting surface is afforded, spread the old roots well out towards the rim, taking care not to bury them too deeply, or they will decay. Work in amongst them the following compost—three-fourths of clean picked sphagnum-moss, one-tourth fibry peat, and a quantity of small broken crocks well mixed together. Until the new growths begin to root freely, merely sprinkle the surface of the compost with a fine water ing-can to induce the sphagnum to grow. As the roots lengthen and commence to take hold of the sides of the pot, so should the supply of water be gradually increased. The Odontoglossum-house will suit them for the present, but when the nights become cold they should be removed to the intermediate-The pretty summer flowering varieties as Miltonia vexillaria rubella and M. v. r. superba will not require repotting until the middle of next month. The beautiful hybrid M. Bleuana and its distinct variety nobilior, now in full growth, should be in the intermediate-house. Afford them plenty of fresh air at all times.

VANDAS.—Plants of the rare Vanda Sanderiana are now rooting freely and showing their flower-spikes. Every care must be taken to preserve both roots and flower-spikes from the attacks of cockroaches. Keep the plants isolated, and in such a position that they may be easily looked over every night by lamp-light. Vanda Kimballiana is also producing its spikes, and should be suspended close to the roof-glass of the intermediate house, where it will obtain plenty of sunlight to bring the spikes to perfection. Both species will require plenty of root moisture until their flowers fade.

MASDEVALLIAS of the Harryana, Veitchiana, and ignea section will soon require attention as to potting, therefore, in the meantime, the plants should be thoroughly overhauled and cleansed from all dirt and insect pests.

THE HARDY FRUIT GARDEN.

By G. WOODGATE, Gardener, Rolleston Hall, Burton-on-Trent.

PEACHES AND NECTARINES.—In cases where the fruit has been gathered from Peach and Nectarine-trees, the old fruiting wood may be cut away, and at the same time it is necessary to stop to one leaf all laterals upon the young growths. Remove entirely all extra gross growths; the young wood will then be exposed to the full sunshine and air. Use the syringe daily, that the foliage may be kept clean and healthy for as long a period as possible.

PLUM AND SWEET CHERRY-TREES from which the fruit has been cleared require attention in regard to securing the shoots left for extension, and the entting-back or removal of breastwood to expose the spurs and next year's bearing wood. Examine the

trees for any insect pest, and if any are found, wash the trees with some good insecticide, and keep them clean afterwards by forcible syringings of clean water. See that the soil in the borders does not lack moisture, or the maturation of the wood and fruit-buds will be hindered.

APPLES AND PEARS.—The earlier varieties, such as Duchess of Oldenburg, Lord Suffield, Stirling Castle, and Devonshire Quarrenden, and of Pears, Doyenné d'Eté, Jargonelle, and Williams' Bon Chrétien, will soon need to be gathered and stored. The fruit-room should therefore be prepared for them by thoroughly cleansing the various stages, shelves, and floors. Allow the doors and windows to remain open afterwards, until the whole of the interior is quite dry. Then close the shutters to exclude the light, but leave sufficient air on to keep the temperature as nearly 45 as possible, the chief point to observe being to keep the room dark, cool, and even in temperature. Early Pears do not remain long, after being gathered, in good condition; it is therefore a good practice to gather a few fruits daily, according to the demand, as soon as they begin to change colour, and thus prolong the supply.

PROTECTION OF THE FRUITS.—Small birds are becoming very troublesome in attacking Apples and Pears as soon as they show signs of ripening. Place nets over trees that can be conveniently covered, and in the case of larger trees, place in them some material to scare the birds, such as pieces of paper tied at the end of short strings, and attached to the outer branches, where they can be blown about by the wind. Notwithstanding the nests destroyed, and the number trapped in bottles, wasps are still sufficiently numerous to necessitate the use of wasp netting over Red and White Currants, Morello Cherries, and Red Warrington, and other late kinds of Gooseberries, where these fruits are required to hang on the trees for some time longer.

THE KITCHEN GARDEN.

By C. HERRIN, Gurdener, Dropwore, Metalenhood.

ASPARACUS.—In districts where dry weather still obtains Asparagus beds respecially those raised with deep alleys between), should be afforded further supplies of weak liquid-manure. On light soils this is very important that the plants may be able to make strong crowns for the production of good heads next season. If liquid-manure cannot conveniently be given, some fish guano sprinkled over the beds and afterwards washed in with clear water forms an excellent substitute. The beds should be kept clean by hand-weeding.

SEAKALE requires very similar treatment to the above, and where the leaves have not dready covered the allotted space, continue to use the Dutch hoe. Weeds may be easily kept down during the dry weather, and it should be done before any autumn rains make the operation more difficult. Soot is an excellent manure for Scakale, and it may be seattered thinly all over the plants and soil; then give plenty of water to carry it into the soil.

POTATOS.—Mid-season varieties, such as Snowdrop, Windsor Castle, and Satisfaction, are ripening fast. In all cases where the tops are becoming yellow, thus indicating maturity, I would lift them without further delay. At present the Potato-disease is absent from many gardens, but should there be a change to dull, wet weather, the fungus may appear and spread rapidly. If they are lifted in fine weather expose the tubers on the surface of the ground for a few hours, until they are thoroughly dry, and the skins hardened. Those for use may then be stored out somewhat thinly on shelves.

GENERAL WORK will consist chiefly in supplying water to the various crops. Celery plants repure copious supplies to keep them growing, and Peas must be thoroughly attended to in this respect. Once the haulm receives a check in growth, subsequent watering is of little use. Another small sowing or Cabbage and Lettuce seeds may be made, also of Radishes for succession, including the French Breakfast and Red and White Turnip-rooted varieties. As portions of the ground become vacant, plant some kind of winter green stuff, Colewort, &c. Thin and transplant the earliest sown Cabbage plants into nursery-beds, giving a space of about 4 inches apart. This will ensure the plants growing stout and stocky, a condition to be desired when planting out into permanent quarters

Measures were taken to remove the great masses of fruit.

FRIDAY.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for aming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communication should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

illustrations. - The Editor will thoukfully receive and select photographs or drawings, switable for reproduction in these pages, of gardans, or of remarkable plants, flowers, trees. &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

APPOINTMENTS FOR THE ENSUING WEEK.

Protheroe & Morris' Rooms. Acc. 28 Important Sale of Established and Imported Orchids at Pro-theroe & Morris' Rooms

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -61.1°.

Before many of our readers

Fire in Covent could have had the last issue of Garden Market the Gardeners' Chronicle, the contingency to which we therein alluded happened. Fortunately the outbreak took place in the forenoon, when the market work was practically over for the day, so that it was soon discovered, but as the subjoined extracts from the Times show, it was not easily extinguished. Those familiar with the Foreign Fruit Market will agree with us that were it not for the free use of iron and concrete in its construction the necessary conditions for a big fire are abuudantly provided in the building, and specially in the neighbouring premises. It shows well for the watchfulness of the custodians that such a fire has not long since happened. Perhaps now precautions will be taken to lessen the risk by the speedy removal of inflammable material and the adoption of all reasonable and obvious precautions.

"A fire of an alarming character broke out at half-past H o'clock on Friday morning in the Floral Hill of Covent Garden Markes. The hill stands by the side of Covent Garden Theatre, extending backwards from Bow Street nearly 100 yards. It is about 40 yards wide, and has a glass roof. Inside, on the ground floor, are rows of wooden stalls. &c., rented by the market salesmon, and these lie well back each side, while the centre of the great hall is generally piled up with masses of every kind of fruit in baskets and boxes, and on flower market days with there of flowers. The building, which is of red brick, was supposed to be fireproof, and the ground floor is of solid concrete. Underneath are extensive cellars, also rented by the market s desinen, an I used chiefly for the storage of thousands of empty crates and The sales were proceeding actively in the body of the Floral Hall, when smoke was observed curling up from the Baw Street end of the structure, apprently from the north-eastern corner. Gradually the volumes of smoke im-reased in density, and a sharp breeze from the south-east blew the smoke well into the interior of the building.

&c., which were contained within the building, and messengers were despatched to ring the fire-alarms in the neighbourhood and to call the firemen. At 11.35 the alarm communicating with the Scotland Yard Fire Station was pulled from Long Acre, and as the engine was turned out of station and was gilloped along the Strand, the clouds of smoke rising from the direction of the market could be seen. Smake was now pouring out of every door in the building in thick clouds. It was obvious that the fire had o tained a very strong hold of the basement, and the difficult task which had to be performed was to localise the actual seat of the outbreak A message from the fire was telephoned all over London to the effect that the Floral Hall of Covent Gurden Market was well alight. Although a strong force soon githered at the scene, the work was of the most puzzling description, and at the same time had to be carried out under extremely difficult circumstances In the front of the building, as well as inside, there were large square 'sun-lights' in the floor, consisting of iron from works, divided into minute squares, which in their turn were filled in with thick glass of peculiar shape The glass was histily hammered in and the water poured down through the framework; but soon after The glass was histily hammered in and the wards the frameworks were taken out, and the firemen stood at the square holes, from which came clouds of pungent, sufficating single, and steadily directed the hydrants into the basement. After six hydrants had been set to work five steamers were brought into play, but by this time the firemen were working in what seemed to be a thick fog, which had extended over the whole of the great hall, and was tempor unly choking and blinding all concerned When the brighte had been at work for an hour it was declared that the fire was still extending, and it was decided to call up aid from other districts in London. Firemen were sent up on the roof to hack away the glass, and so give vent to some of the smoke. The holes thus male soon had a very beneficial effect. Mr. GAMBLE, finding that his men were still buffled in their efforts to reach the heart of the fire, and were quite unable to get down into the basement, determined to try an American patent in the shape of a respirator with eye-glasses fitted, for which the merit was claimed that a fireman out enter the densest smoke without inconvenience. Fireman Allshorn, who is attached to the Southwark headquarters, put on the apparatus, and, a rope being tied round him, he was lowered into the bisement at the Baw Street end. He presently returned. indicate the exact position of the fire, which was in the north-eastern corner of the building and close to the Covent Garden Theatre - The appliances were then concentrated in this direction, and it was soon obvious that the deliveries were having an effective result. The smoke momentarily decreased in volume, and at a quarter past 1 o'clock the brig de had reached the centre of the fire, and were enabled brig ele had reached the centre of the fire, and were enabled half an hour later to complete the work of extinction. How the fire originated is unknown."

A "JADOO" CONSERVATORY .- The conservatory at Easteliff, Teignmouth, of which we on p. 219 give an illustration (from a photograph by DENNY, of Exeter and Teignmonth), differs from all others that have hitherto come under our notice, in that all the pot-plants used in it are grown, not in soil or earth of any kind, but in Jacleo fibre, which, as many of our readers know, is peat-moss boiled in certain chemicals. The plants grown in the hanging-baskets are in the same material, which, being only half the weight of ordinary mould, permits of baskets being used in couservatories, the rafters of which would not be strong enough to bear the weight of baskets filled in the usual way. There is nothing particularly novel or uncommon about the plants used, if we except a basket filled with Asparagus Sprengeri, which has an exceedinglylight, graceful character. A portion of the roof is covered with a profusion of flowers of Ipomora Learii. This and the old specimen of Heliotrope which luxuriates over one of the walls are the ouly plants not growing in Jadoo. The others consist of Fuchsias, Cannas, Tuberoses, Gladioli, Liliums lancifolium and tigrinum, white Marguerites, Begonias red, white, and yellow, self-coloured Carnations, Streptocarpus, Kalosanthes, Abutilons, Ivy-leaved Pelargonium (Souvenir de Charles Turner), and Lobelias. These, mixed with green and coloured foliage of Ferns of many kinds, Coleus, Strobilanthes, Ophiopogon, Panicum, Isolepis, and Selaginellas, have been well arranged by the gardener, Mr. SYMES, who has produced a very pleasing effect. Jadoo fibre is reputed to improve the colour of flowers grown in it; this was very noticeable in the display of blooms in this conservatory, where the purity and brightness of the colours were very unusual. Colonel HALFORD Thompson may be congratulated upon this desirable result of growing flowers in Jadoo.

HORTICULTURAL DEPARTMENT OF THE ANTWERP ZOOLOGICAL [GARDENS.-Among the

various fine groups of plants here is a very interesting collection of Agaves. Among them are Agaves Victoria Regina (A. consideranti), rare and little known; Beguini, a novelty; Ponettii, also new; Ousselghemiana, mitræformis, cœrulescens, an excellent variety; univittata obscura, Gibeyi, also uew, as is Bilmondii. I would mention, further, the beautiful Fourcroya Lindeniæ, Euphorbia cœrulescens, grandis, mamillaris, and grandicornis. The peat plants include species of Andromeda, Skimmia, Vaccinium, Rhododendron, Kalmia, Azalea, and Ledum. The collection of Ericas includes all the species kuown in Belgium. Very fine also are Andromeda tetragona. Lyonia, and Pernettya angustifolia. Among the species and varieties of perennials, I noticed Cypripedium calceolus and spectabile, which flower annually; Spigelia marylandica, fine varieties of Iris Kæmpferi, of Liatris spicata, Statice, Spirma Bumalda Anthony Waterer, and Phlox Snowball. Alpines are well represented. I saw Caucasian Primulas which had seeded, ('ampanula Zouckü (Zoysii ?), Edelweiss, Aquilegia Bertoloui, Gentiana gelida, asclepiadea, septentrionalis. Acena microphylla, Scutellaria alpina, Erica mediterranea, Aster alpinus, a fine specimen of Juniperus tamariscifolia, and pretty species of Epimedium and Saxifrage. In a small stream grow and flower Nymphiea rosea, alba, and Marliacea macrotella fol. marmoratis. A tree Heliotrope here is very fine; it measures about 12 feet high by 6 feet across, and was grown from a cutting made in 1849. Five of its. descendants are now nearly 5 feet high; all the plants bloom freely. One very effective decorative group is composed of fine specimens of Chamærops Fortunei, Phonix tennis, Areca Baueri, Chamorops excelsa, C. e. pumila, Musa ensete, Dracæna indivisa, Phormium Colensoi, Draciena australis. Fourcroya Lindeni, and Caladium esculentum. The base of this bed is enlivened with hardy perennials and Alternanthera amona and paronychnoides, tuberous Begonias, Viola azurea, Ophiopogon jaburan, Phalangium angustifolium, Cineraria argentea plumosa, Lobelia, and other plants. There are also here baskets of tuberous Begonias, giant summer Stocks, and Roses; clumps of Tritoma (Kniphofia), Lilium auratum, Montbretia crocosmæfiora, and Gladiolus; arrangements with fringed double Petunias, Canna, Erythrina cristagalli, Zonal Pelargonium var. Foucard, Zinnia, and Heliotropum peruvianum. The excellent order in which the garden is kept is owing to the skill of the Director, M. L'HOEST, and the intelligence and zeal of the gardener, M. Louis Blockx. Ch. De B.

ROYAL HORTICULTURAL SOCIETY .- The next meeting of the Fruit and Floral Committees will be held in the Drill Hall, James' Street, Westminster, on Tuesday, August 25. A lecture will be given at 3 o'clock by Mr. T. Jannoch, F.R.H.S., Dersingham, on "Forcing Lily of the Valley."

RECORDS OF THE PAST,-We take the following extract from Jackson's Oxford Journal, it being a reprint from one of the back numbers of that journal for 1767 :- "BEYOND DESCRIPTION.-Advt., May 20, 1767. To be sold at Bloxham, Oxfordshire, by EDWARD NELDER, gardener, his entirely new and true both Cabbage and Winter Green miraculous plants (so called from their different forms) which, when they are at their full growth, are innumerable; nor can the like be produced by all Europe. The abovesaid forms, which appear on the leaves when at their full growth, are from 5 to 9 inches in length, and not only the finest pickle, but also the most noble garnish that ever were made use of, and when boiled (which is done in a few minutes) they are of the most agreeable flavour. The Cabbage plants, when in perfection, measure, at the extremity of their leaves, from 3 to 20 feet in circumference. They stand the winter exceeding stout, and are in short, both pleasing and profitable, affording more variety than a hundred flowering shrubs, nor can the most exquisite workman delineate the same either with pen or peucil, they being beyond all description. Price from one shilling to two shillings and six pence each plant."

HAMBURGH EXHIBITION, 1897.—We have received official information from the Government, through the Director of the Royal Gardens, Kew, of this show. We learn also that the Council of the Royal Horticultural Society has formed a committee to co-operate in England with the Committee of Management of the great Hamburgh Horticultural Exhibition of 1897. The following gentlemen have been requested to act on this committee, with power to add to their number :- Sir TREVOR LAWRENCE, Bart. (Chairman); Messrs. H. J. Veitch, W. T. Thiselton Dyer, C.M.G., Dr. Morris, Baron Schroder, Owen Thomas, Geo. Bunyard, J. T. Bennett Poe, H. Selfe, Leonard, Chas. E. Shea, W. Marshall, Philip Crewley, and the Rev. W. Wilks, M.A. The committee will meet as soon as the holiday season is over.

A GARDENERS' RE-UNION.—A pleasant gathering of gardeners took place on August 13 at Park Place, Henley-on-Thames, on the occasion of the annual meeting of past and present employe's of Mrs. Noble. Some few years ago it was suggested that all past gardeners who could be found should be invited to spend a day at Park Place, and meet the present members at a game of cricket. So heartily were the invitations accepted, and so many were the expressions of pleasure at revisiting old scenes and meeting old friends, that the gathering has now become an annual one. At the meeting on the 13th inst. occasion was taken to present Mr. Stanton, the gardener, with a token of the esteem and affection in which he is held by all who have had the privilege of working with him. The presents constituted portraits of Mr. STANTON himself, his son, and his daughter, also an illuminated address containing the names of nearly one hundred subscribers.

BUNYARD'S CENTENARY SHOW.—In order to celebrate the centenary of the establishment of the firm of Messrs. Geo. Bunyard & Co., of Maidstone, an exhibition of horticultural products will be held in the Corn Exchange, Maidstone, on Sept. 15 and 16. Cash prizes to the extent of £150 are offered for fruits and vegetables, and besides gardeners' classes, there will be some arranged for cottagers and cottage-garden societies.

PULBOROUGH AND DISTRICT HORTICULTURAL SOCIETY. — The annual show was held in the Vicarage Grounds on August 12, and a fine collection of flowers, fruit, and vegetables was brought together, the quality of the Potatos being of unusual merit. The non-competitive groups from Heywood Johnstone, Esq., M.P., Sir Walfer Bartelott, and other local gentlemen, added greatly to the attractions of the show. Mr. Jenner, Horsham; Miss McRonald, Chichester; and Messrs, Cheal, Crawley, sent specimens of the various specialities grown in their nurseries.

WOOD PULP FOR THE PRODUCTION OF PAPER, as an item in our import trade, continues to increase in importance. In June of 1894, there were brought to this country 21,651 tons of wood pulp; in June of the present year, the quantity had increased to 27,180 tens-an increase of 5,499 tens. In the first six months of the present year we imported 146,752 tons -by the close of 1896 we may reckon on having imported a quarter of a million of tons, if not more. We thus get the foreign producers to compete with each other in sending the raw material to our market, enabling us to successfully compete with him for the manufactured article. A certain French daily newspaper states that it prints and issues every day over a million copies—"the largest circulation," doubtless -in twelve months "working up" 120,000 Fir trees averaging 60 feet in height, and equalling the thinning of 25,000 acres of forest. We do not vouchbecause we have not the means of doing so-for the correctness of this statement; but we give publicity to the above figures as they show how greatly the wood-pulp made paper trade is increasing.

EPPING FOREST.—In an article on this forest in a recent number of Garden and Forest occurs the following passage, presumably written by one who occupies the foremost position in America as an authority on such matters, and this is what he says: "The

people who insist that the forest must remain just as it is ought to know that these mntilated Pollards are anything but natural, that they are permanently disfigured, and will never make respectable npright trees. The managers of the forest are aware of this, and they knew that the Pollards stand too thickly for their own wholesome development, while the dense growth of their spindling branches will destroy the beautiful undergrowth which took possession of the ground when the lopping of the trees let in the light and air. They are aware that these clipped and artificial trees should be severely thinned out, and although some of the unarled and twisted trunks should be left for their picturesque qualities, a vigorous use of the axe is the one thing which the forest most needs. And yet in England, as in America, whenever a tree is felled the people raise a clamour as if it were a desecration, when really this is only helping nature to reassert herself and encourage genuine woods to take the place of an unnatural growth. Young trees in abundance are coming up, and if an opportunity were only given to them the whole territory could be renovated in fifty years, and he a thousand times more levely than it would be if let alone. And another problem will soon be pressing. Many parts of the forest are now thronged with visitors, but other parts are often so lonely that one can find in them almost the solitude of some of our primeval woods. As the giant city sweeps to the north and envelops the forest, the numbers of people who come to refresh themselves in its dark recesses will multiply. It will then be more difficult to preserve the charm of natural forest conditions. The undergrowth will be trampled to death; there will be need of drainage to make dry walks, and this will sap the life of some of the trees; the by-paths will be worn wider; the turf in the green roads will be ruined. Then will come the same problem which presents itself to the park-makers in our own country, where land is set apart for refreshing the bodies and the minds of invaling multitudes-the problem how to provide for human convenience most completely, and yet save as much of the poetic beauty of the wood as possible.

HARDNESS OF WHEAT-GRAINS.—We find in the Agricultural Gazette of New South Wales for May an elaborate and valuable article on this subject, representing the results of some 8,000 tests made during a series of years on various kinds of Wheat. The grain was placed between a pair of cutting-pliers attached to a spring balance, worked by a crank. regulated by a pendulum, and provided with means whereby the maximum amount of strain endured by the wheat-grain before crushing is registered. The number of ounces registered on each trial indicates therefore the amount of pressure exerted. Forty grains of each variety were taken, and an average drawn from the forty. The variation ranges between 123 oz. and 297 oz. Mr. Cobb, who conducted the experiments at the Wagga Experimental Farm, calls attention to the indefiniteness of nomenclature in the case of varieties of Wheat-an indefiniteness that renders much of the work that has been done formerly worthless. Want of purity is another source of confusion and inaccuracy. Mr. Cobb took special pains to ensure that his Wheats were properly named, and that the sample was pure and unmixed. The paper is one which we cannot say more about in this place, but that it is of great value may be gleaned from what we have said.

"THE STUDENTS' HANDBOOK OF BRITISH MOSSES."—Under this name Messrs. WILLIAMS & NORGATE publish a thick octave volume, prepared by Mr. H. N. DIXON, and with illustrations and keys to the genera and species supplied by Rev. H. G. JAMESON. The subject is not sufficiently horticultural to allow us to devote much space to it, but a perusal of the introduction and preface, and of many of the notes to the species, leads us to recommend the book with much cordiality to students of mosses. The classification is based on that of Schimper, with sundry modifications, necessitated by modern research. The anthor shows himself by no means oblivious of modern innovations, but manifests also prudence in not disturbing more than is requisite the

generally - accepted limitations. The finality he speaks of, we fear, is not in the nature of things. The full synonymy is not attempted, but the emission of any indication of the date and place of publication of the original species is unfortunate. The plan of calling attention to the salient points of any particular species by means of italics is helpful to a student, if he takes care not to attribute to it greater significance than the author intends. Mr. Dixon thinks this plan has not been employed in any of our British works on the subject. Perhaps not in the case of mosses—but has the author forgotten his Babington? There are no fewer than sixty plates, each comprising several species, the details concerning which are all drawn to scale.

A NEW INSECTICIDE. — A substance recommended as a substitute for Paris Green in spraying mixtures for destroying insects on plants, and alleged to be non-injurious to foliage, has been found by F. T. Shuff to consist of lead arsenate. The insecticide is prepared by disselving 3 onnces of sodium arsenate in a quart of water, and 43 ounces of lead acetate in a similar quantity of water, then pouring both solutions into a barrel containing about 45 gallons of water, and stirring well. The volume may then be made up to 50 gallons. The white amorphous lead arsenate formed remains longer in suspension when thus precipitated in a large volume of water than when concentrated solutions are mixed and subsequently diluted. A slight excess of lead acetate remains in solution, thus preventing risk of injury to foliage that might result if sodium arsenate were in excess. Pharmaceutical Journal.

A DWARF TYPE OF ANTIRR-HINUM.

DURING such a season as the present one has been, remarkable for great heat, and not less so for continued absence of rain, it is seen that there are certain plants in the flower-garden that withstand these adverse circumstances much better than others. In another column Mr. Wolley Dod calls attention to the remarkable manner in which Statices have bloomed, and have shown themselves to be desirable plants for hot, dry soils. Another type of plant that has flowered exceedingly well this season, and which generally does, when circumstances are similar, is the Antirrhinum. In fig. 43 is represented a plant of a very dwarf type shown by Messrs. II. Cannell & Sons, Swanley, at a meeting of the Royal Horticultural Society on July 28th. Of course taller varieties are preferable for some purposes, but in small gardens, or for forming edgings, and similar uses, the dwarf type is an excellent one. At the meeting already mentioned, Messrs. Cannell's plants bore clear, distinct, self-coloured flowers, or variously striped or mottled ones.

HOME CORRESPONDENCE.

THE GARDENERS' ORPHAN FUND: SOME SUG-GESTIONS .- At the present time, when many snggestions are being made as to the most fitting manner of celebrating Her Majesty's long reign, it may not be inappropriate to suggest some ideas that, if carried into effect, would be the means of materially benefiting the Fund which owes its inception to British gardeners on the occasion of Her Majesty's Jubilee in 1887. Much has happened in the time which has transpired since the formation of the Gardeners' Orphan Fund. It is well to look facts in the face, and if this is done, it will be found that the Fund is not supported by the craft to the extent it deserves to be. Let us see if in 1897 we can help the beneficent work begun in 1887. In the early days of the Fund there attended at the annual dinners a large number of gardeners. The tickets for this event were procurable at a reasonable price, and even those on the lower rungs of the gardening profession could attend it, became warmly interested in the good cause which called them together, and probably determined to become subscribers to the Fund. It may be that the guinea dinner (a sum which does not represent the actual cost of attendance) ensures a good subscription list; but such a "list" is purchased at a very dear price if it shuts out

-as it must do-the very class who by reason of their pecuniary position cannot, but ought to and would, be present were the price such as they could afford. As a means then of enkindling some enthusiasm in the breasts of gardeners towards this Fund, let a truly representative gardeners' dinner be organised in on June the 20th, all the more appropriate. It might also be a good idea to send a collecting-card to every head gardener in the United Kingdom, with an earnest request from the executive committee that he should collect as much as possible before the memorable day. As showing what may be possible, ! might refer to what was achieved recently by the employes of "Harrod's Stores." As the result of the collection and fête given on the 8th inst. at Barnes, a sum of £2,000 will be handed over to Guy's Hospital for the purpose of endowing two beds in perpetuity. suggests a further thought, although it may not be possible to carry it into practical effect next year. It may, in fact often does, happen, that some of the present recipients of the Funds' allowance are ill, and the mother by her very poverty is precluded from the novelty attached to the employment of such tender annuals for outdoor bedding or decoration, great admiration has also to be given to the strain, which is a glorious one. Every plant has been well grown, and forms a little bushy pyramid: each plant has perfect pointed spikes of bloom, either of rich apricot, or of crimson and Planted in treble rows on the north and sheltered side of one of the central footpaths leading from the Portland Place Gate to the Botanic Gardens, these Celosias are indeed beautiful. The intensely rich colonrs of the tufts quite outvie those of the richest of Begonias. Of course, the strain is said to be one of Mr. Jordan's own development. Most certainly it is a good one. We may not merely marvel to see such plants in a flower garden in this way, but equally feel surprised that such singularly elegant decorative plants, so easily raised from seed, are not found in every garden. There can be no are not found in every garden. There can be no question but that fine strains are in commerce, and some may be as good if as well treated as is the one at the Regent's Park. A. D.

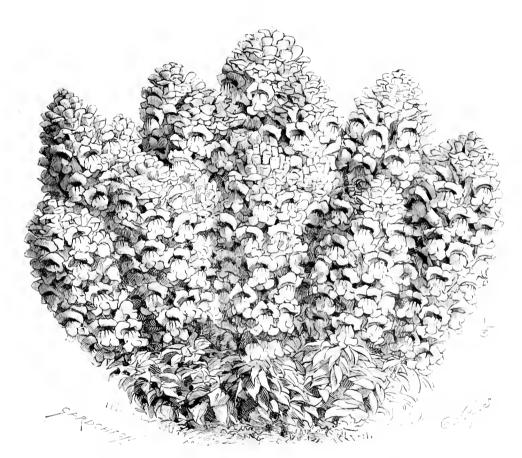

FIG. 43.—CANNILL'S DWARF TYPE OF ANTIRRHINUM. (SEE P. 220.)

getting them proper medical advice and attention. Could not the gardeners of the United Kingdom combine, and by their contributions be the means of "endowing" one or more Gardeners' Orphan Fundbeds in perpetuity? The holding of concerts, which has in the past been of good service to the Fund, seems to have become less common. Would not the Queen's Celebration in 1897 be an opportune time for its vigorous resuscitation? I am sorry to see that Chiswick, which very successfully led the way in the matter of concerts for some years, has abandoned the work. The Chiswick Gardeners' Association, under whose auspices these concerts were held, night take the hint, and follow the example of a similar association at Ealing, which organised, last Autumn, a very successful snoking concert in aid of the fund. J. B.

CELOSIAS AT THE REGENT'S PARK.—To those who have not previously seen these singularly beautiful plants as employed by Mr. Jordan at the Regent's Park, the first view undoubtedly creates surprise and admiration. Apart altogether from

THE VICTORIA REGIA IN THE ROYAL BOTANIC SOCIETY'S GARDENS.—This Regal Water-Lily is now in splendid condition in Regent's Park; the specimen has put forth seven enormous leaves, and flowers quickly succeed each other. There must be thousands of persons in London alone who have never seen this magnificent plant, and as, in all probability it can be looked upon only at the Royal Gardens, Kew, and in the Regent's Park, the opportunities for seeing it in the metropolis are few. During August, and early in September, the Victoria Regia will be at its best, and well worthy of a visit. R. D.

GOVERNOR WOOD CHERRY.—I endorse Mr. Wythes views on Cherries in general, and especially his high estunate of Governor Wood. Permit me to repeat it, and add to it, "The variety most favoured among the lighter-coloured is Governor Wood, a large pale-red fruit, and the tree a grand cropper: indeed, I have never known it to fail here (that is, at Syon), and on a west wall it is in season in the middle of June. This variety may be called one of the best;

it is worth the trouble of making a special border for it by draining and adding lighter soils, as well as mortar rubble, and charred earth." I should think it is, indeed, and wherever a yard or two can be found for a Cherry-tree under glass or out of doors, on walls or hoardings, south, north, east, or west, or in open gardens or orchard, let it be filled with Governor Wood. Were I limited to one Cherry, Governor Wood should be chosen without a moment's hesitation. D. T. Eish.

PHALÆNOPSIS AT NOSTELL PRIORY GARDENS.—Some few weeks ago, when calling at the above place, a plant of P. Schilleriana was pointed out to me by Mr. Easter, which had made a leaf 20 inches long by 4 broad. Is not this an unusual size? I have not seen one of these dimensions anywhere before. There are in the same house some fine plants of P. amabilis, P. Sanderiana, P. grandiflora, P. violacea, P. Stuartiana, and several others, all in the picture of health. J. T.

FORMALDEHYDE —Those who propose to experiment with this substance use tard. Chron., Aug. 15, p. 193), may obtain it readily, perhaps, as "Formaline," under which name a 10 per cent. solution, in water, is largely sold. It is an oxidation product of methyl alcohol, obtained by passing the vapour, with air, over hot platinum spiral or hot copper gauze. It has been claimed that formaldehyde occurs in the chlorophyll cells of certain plants, representing the first stage in the synthesis of sugar, by the plant, from CO₂ and H₂O. Of this I find no confirmation, either in the works of Vines, Darwin, or Acton, but in the latter work reference is made to its poisonous character to plants even in very dilute solutions. R. J. L.

THE NON-WARRANTY CLAUSE.-We noticed in your recent issue a paragraph in reference to the above. For the first time in many years' experience of the seed trade, we have recently had occasion to feel the hardship of this objectionable clause. A wholesale seed merchant sold us, and invoiced a particular variety of field Turnip-seed, which was in turn retailed by us as the variety invoiced. When too late, we discovered that an entirely different sort was sent—a well-known garden variety worth 30s, to 40s, per acre less to the farmer. The sellers on being advised of the matter, expressed regret for their inistake, but on the question of compensation being mentioned they very curtly referred us to the non-warranty clause on their invoice, leaving to us the entire responsibility of settling with our customers. We have not yet been able to ascertain whether with this clause on an invoice a man may legally invoice Turnip seed, and send Rape, or not; but it such is the law, it is high time retail scedsmen combined to put an end to such an iniquitous system of doing business. A Seed Merchant.

STREPTOCARPUS. -- Although various growers of these very charming greenhouse plants have accomplished a good deal in developing habit, form, and colour, yet no one seems to have been more successful than has Mr. Salter, gr. to T. B. Haywood, Esq., Woodhatch, Reigate. Not only has he materially developed form of flower and colour, but he has also produced some of the finest specimens yet seen. Many of these now resting quietly in a cool frame, were for Streptocarpuses almost huge examples. When in bloom earlier in the summer, they excited the surprise and admiration of eminent florists. But the chief interest just now is found in a batch of seedlings raised from a January sowing from last year's saved seed. Here may be seen the richest colours yet presented, the deep indigo or violet blues being singularly attractive; there are also very deep being singularly autractive; there are also very deep maroon, violet, and rose reds, and one of a terra-cottal line is specially pleasing; there are fine whites, having heavy maroon bars of colour in the throats, and others pure white throughout. Some of a French or creamy-white with very fine lines are striking. In one flower there is distinct splashing of white on a reddish ground indicative of a possible flaked puce. Some of the light blues show marbling of white. This batch of seedlings when put into larger pots and well grown next year will make a very beautiful group. They also serve to show that it slowly there is yet distinct advance being made in Streptocarpuses, quite apart from any intercrossing with other It is much in the favour of these plants that they can be grown and flowered easily in au ordinary greenhouse, that they bloom over a long season, are easily preserved from year to year, and furnish when strong plants so much material for small glass or vase decoration. It.

SOCIETIES.

A VIOLA CONFERENCE.

(Continued from p. 198.)

AUGUST 8 -VIOLAS FOR BEDDING

Mr. C. Jordan, of the Regent's Park, next read a carefully MI. C. JORDAN, of the Regent's Fark, next read a carefully prepared and able paper on "Violas for bedding, with special reference to their adaptability for association with other plants." After some introductory remarks, in which the reader bore testimony to the value of the labours of the pione-rs of Viola culture, he went on to say that it was not advisable to form large patches or lines of any one variety of Viola; the plant associates most readily with other subjects, the diversity of its colouring admitting of fanciful as well as simple arrangements. In whatever way Violas are used, good plants, proper soil, sufficient space, and ordinary attention are requisite; and also watering during dry weather. After some months of blooming some stimulating manure is necessary to maintain the succession. Gardening operations in the London parks are so arranged that the main results are looked for in spring and summer, one season overlapping the other. The subsoil in the Regent's Park is a cold clay, and therefore Violas are treated simply as summer bedding-plants, as it is risking the stock too much to allow them to remain in the open all the winter. Still the Viola is an excellent plant for town gardens. In the park large quantities are used, and the number required is obtained by division of the old plants after removal from the beds; they divide into a great many. About midsummer the plants are lifted, cut down, and planted in the nursery-garden, and in the autumn divided and planted, so that they can have protection during winter, and be planted out early in the year for spring and winter, and be planted out early in the year for spring and early summer work. The supply for the summer display is obtained from cuttings struck in September. Proper trans-planting to the heds and borders is of the greatest impor-tance, and it should be carefully done. In spring Violas are tance, and it should be carefully done. In spring Violas are used as a ground for beds of Hyacinths, Tulips, Narciss, &c. Blue Bell is the best employed for the purpose, when planted in masses it produces an effect not unlike that of the wild Hyacinth; in the woodland Countess of Kintore is frequently seen to advantage from its rambling habit. It is associated in spring with East Lothian Stocks, Dielytras, Spanish and English Iris, &c., and it is one of the best varieties for blooming early. The scrambling habit seen in some of the Violas is valuable for association purposes. Grievei has, in a favourable season, overgrown the Canterbury Bells, and at the beight of 2 feet filled the whole bed, and flowered freely during the greater part of the summer season.

To associate with the early growth of hardy Ferns, and to beighten the effect of their delicate greenery, nothing is more suitable than the Viola; it is an excellent successor to the common Primrose. A garnishing of our English Ivy with a setting of bright Violas forms an effective combination. In the wild garden the simplest method is to sow the seeds, and the wind garden the simplest method is to sow the seeds, and allow the plants to look after themselves, but during dry weather a certain amount of moisture must be provided for them. It is necessary to note that the Viola has a decided preference for fresh ground, and this is a matter of so much importance that in the Regent's Park it is thought necessary to record all the positions where Violas are planted each season. If by accident they are placed in succeeding seasons in the same bed, a distinct falling off in results is noticeable. and there is difficulty in securing healthy stock the sunniest positions in a confined garden should not be selected for Violas, except for spring service, nor should they be planted on the edge of a raised bed or border where the position is dry, the sun's rays would endanger the well-being of the plants, drawing the moisture from the soil Lastly, Violas should not be planted in positions where the flowers turn their backs to the spectator; their blossoms should be drawn to the front to be effective. The following is a list of the varieties employed in the Regent's Park for the spring and summer display:—
Ardwell Gem, Archie Grant, Blue Bell, Clevedon Purple,

Pullion, Countess of Kintore, Countess of Hopetonn, Councess of Wharneliffe, Grievei, J. B. Riding, Lilaema, Sylvia, nd Violetta.

These are usually arranged in beds and borders associated with Carnations in considerable variety, lvy-leaved Pelargonums, Fuchias, Begonias, tuberous and fibrous rooted; Phloxes, Chrysanthemums, Lilies, Celosias, &c. A discussion followed on the reading of this paper, Mr.

A. DEAN stating that he found the old Blue Bell mentioned by Mr. Jordan still very popular in many places—It was not subject to dying out, as was the case with other varieties. Raisers should make a study of the characteristics of Eluc Bell, and seek to approach them in raising new varieties. Violas had an excellent effect when massed, and there was violas had an excellent enect when massed, and there was no plant which better barmonised with other subjects. A variety named Acme, growing in the trial of Violas, he thought, was simply a reproduction of the old Cliveden Purple. True Blue he considered the truest blue, and a dwarf compact variety of this colour was needed, to be used for edgings, as in the case of the blue Lobelia. In the South it was found necessary to plant in the autumn for summer display, and especially so when employed for spring hedding Early flowering varieties, which will bloom about the same

time as the Primrose, are very necessary.

The Chairman said he had lost two thirds of his stock, which he attributed to growing them on the same spot year after year; but as his garden was almost all Violas, he unfortunately could not change the ground, as the whole of his

gardeo was occupied by them

Mr. J. W. Moorman, the Superinten lent of Victoria Park

read a paper on Violas for Bending. After referring to the many uses to which the Viola could be put, Mr. Moorman said the self-coloured varieties are the most suitable for bedding, though some of the blotched varieties, such as the Mearus, are strikingly effective when associated with white variegated or bronze-leaved Pelargoniums; of white varieties, Countess of Hopeton and Sylvia are two very reliable; Bullion and Ardwell Gem are well-known among the yellows, and will hold their own for earliness and conthe yellows, and will not their own for earliness and continuity of bloom, their habit of growth and constitution being all that could be desired. Bullion is admirable for massing: Ardwell Gem, owing to its creeping habit of growth, makes a good front edging to beds: Lord Elcho and George Lord are desirable yellows for bedding. True Blue, Archie Grant, Holyrood, and Blue Bell are varieties whose constitution and habit it them for asso-ciation with other plants. Wm. Niel, J. B. Riding, and Duchess of Sutherland are indispensable; their small wellformed blooms are very effective. Wm. Niel and Duchess of Sutherland are perhaps of greater usefulness than the more defined self flowers. The blotched or Countess of Kintore type are most pleasing, also Border Witch, Duchess of Fife, Gold Finch, and White Duchess. Violas, to asscciate with other plants, require a bardy constitution, free blooming, and the tlowers of good substance, well thrown upon long footstalks, so that they may appear above the foliage Archie Grant, Ardwell Gem, and Duchess of Fife may be cited as varieties having long footstalks. Violas, to do well need deep cultivation, long foot-stalks. Violas, to do wen need over cound, and especially in dry seasous; well manured ground, and frequent soakings of water from a rose watering pot. Watering because is highly objectionable. Watering ing by means of a hose is highly objectionable. Watering overhead does not disfigure the blossoms, as in the case of other plants. Violas are easily propagated by means of cottings; late autumn-struck cuttings are the best for summer bedding. At Victoria Park plants in the open will summer bedding. At Victoria Park plants in the open will not live through the winter, no doubt owing to the vitiated atmosphere in the East-End. It sometimes happens that the plants become sickly, and appear to be affected by eark r, and it is more perceptible when the plants occupy the same ground the following season. Red spider is troublesome: the best remedy is high cultivation. Fuchsias associate well with Violas, especially the red-flowered varieties with white and yellow Violas; hight Fuchsias with a deep blue or like variety. Wo Niel is Fuchsias with a deep blue or like variety. Win. Niel is charming when used with bronze-leaved Felargoniums; the charming when used with tronze-leaved relargantins; the lavender-blue Duchess of Sutherland is always attractive, allied with any contrasting variegation. Yellow Marguerites and the blue Cornflower, with a carpet of white varieties, are excellent; blue Violas go well with white Marguerites; Win. Niel and J. B. Riding with Ivy leaved Pelargoniums are

In discussing the paper by Mr. Moorman, Dr. Shackle TON pointed out that the merits of the Violetta type had been overlooked, as the varieties remained in bloom a long time, and they were particularly well-adapted for small beds time, and they were particularly well-adapted for shall be us. In replying to some observations, Mr Moorman stated, that when he had charge of Dulwich Park, he was able to lift Violas in the autumn winter them under some protection. and replant them in spring; but he could not do so at Victoria

Papers were then given by Messrs. W BAXTER and H. A.

NLEDS on Violas for exhibition.

Mr. R. Dean then read a short paper on

VIOLA SPORTS

prepared by Mr. J. D. STUAKT, a well-known raiser at Belfast. The writer stated that he proposed to use the term only in that limited sense in which it is applied to those variations in colour, either temporary or permanent to which some Violas are subject. Heat and moisture frequently affect the are subject. Heat and moisting requestly are the colours of flowers, and these are inaccurately termed "Sports." In Violas in which the ground colour is white, with purple of some shade as a being, or in flakes, the purple is apt to disappear during hot, dry weather, while it extends beyond the normal area when atmospheric moisture is abundant. It is curious to observe that watering, however generous, does not produce the same effects; the colours seem to depend more on a saturated atmosphere than on a saturated soil. Such temporary sporting is, no doubt, to saturated soil. Such temporary sporting is, no dealet, to some extent dependent on soils and mannes, a rich soil, or the application of manner, natural or artificial, causing the plants to throw up into of blue or purple, which are entirely absent when the plants are grown in poor soil. Sports, properly so-called, are not of this character, but can be proved to be independent of conditions of soil or atmosphere. One of the best-known and most charming Violas in cultivation is Goldfinch. This originated as a sport from Ardwell Gem; it has the same briginated as a spint from Ardwell dear, it has to be about and character as the type, and the proof that it originated from Ardwell Gem is found in the fact that it originated from Ardwell teem is found in the fact that it reverts to the type. Mr. Sruakt referred to sports from Goldfinch, and concluded by saying be had come to the conclusion that in sports there is a reversion either to the type or to a remote parent, in greater or less degree. Cases were or to a remote parent, in greater or less degree. Cases were quoted, such as Amy Barr, reverting to Win Niel, of which it is a seedling. J. B. Riding, sports back to Win. Niel, also from which it originates. Other cases were meutioned, Mr. Stuart stating he is not aware there is a single sport in contivation that he has not found reverting to the type, or a remote parent. An interesting discussion followed upon the reading of this paper. Dr. SHACKLETON said the subject of sports was a very interesting one; the influence of soils or manures upon sports was diffiout to determine; it was like the influence of drugs on human beings, varying with each individual. He noticed

there did not seem to be so many sports from the darker Vio'as. Quaker Maid had given him a permanent sport be continued to grow, while Duchess of Fife had produced a grow, while Duchess of Fife bad produced a sport intermediate hotween the Duchess and Quaker Maid. As to whether the backers and Quaker Maid. As to whether they could produce sports artificially, he had heard it recommended to water the plants well with permanganate of potash, but he did not think it had proved successful. Mr. W. BAXTER said that Wm. Niel often sported to J. B. Riding, but he had never known the latter to revert. Mr. G. McLeop said that. Duchess of Fife, Goldfinch, and Ardwell Gem, were con-Duchess of Fife, Goldânch, and Ardwell Gem, were constantly sporting one into the other, Wm. Niel had sported with him several times, and might be taken as a sportive variety; but the cause of sports he could not explain Mr. Allison said he had tried Wm Niel in three different garliens, but hid never seen it sport. Dr. SHACKLETON further stated that he thought the production of sports had more to do with the stems of the plants: as a plant, though busing correlations, would neverbe not produce to though having several stems, would probably only produce a sport on one or more stems, the rest bearing normal blooms. He did not think the originating cause came from the roots, as they supported the whole of the plants.

WILTS HORTICULTURAL.

AUGUST 12 .- By permission of the Lord Bishop of Salisbury, the Wilts Horticultural Society held its annual exhibition in the episcopal grounds, Salisbury, on the above-mentioned date. Taken on the whole the show compared favourably with any of its predecessors, a fact which speaks well for the management of the committee and courteous Hon. Secretary, Mr. Chas. Geo. WYATT.

Plants - Prizes to the value of £15, £10, and £5 were offered for twelve stove and greenhouse plants, distinct, six foliage and six flowering. Messrs James Cypher, Cheltenham, Mr. Wilkins, gr. to Lady Theodore Guest, 'nwooi; Hensermie, and H. Peel, Shirley, took the prizes in the order D which their names appear. The 1st prize collection consisted of Statice profusa, Erica obbata purpurea, Bougainvillea Sanderiana, profusely flowered; Phenocoma prolifera Barnesii, Pancratium fragrans, of great size and grandly flowered; Dipladenia hybrida, Croton Chelsoni, well-coloured; Kentia Fosteriana, Cycas circinalis, Phenix rupicola and Latania borbonica.

Messrs. Puel and Wilkins secured 1st and 2nd prizes,

Messes. ITEL and wikins secred is and 2nd prizes, respectively, for nine store and greenhouse plants, four in bloom and five foliage. Mr. George Hall, gr. to Lady Asheurron, Melchet Court, Romsey, was a good lat for six evotic Ferns, including a fine plant of Dieksonia antaretica; Mr. Peel was 2nd. Mr. A Robey, gr. to Major Llovo, Burnham Cliff, Salisbury, had the best half-dozen tuberous-rooted Begonias.

Groups.—Several good groups were arranged in the three classes set apart for them. In the open class Mr Wilkins, Mr. Carr, gr. to A. Gilleit, Esq., Bishopstoke, and Mr. Bedford, secured the prizes in that order for excellent arrangements, all three heing very close to each other in point of merit, the ground-work, as usual, consisting of Maidenhair Fern, with agracefully-growing Palm in the background, and "dot" plants of brightly-coloured Crotons, Drace as, variegated grasses, small Palms, Francoa ramosa, Cattleya imperialis, Uncidium incurvum, &c, the whole being enclosed by an edging of Panicum variegatum.

closed by an edging of Faincum variegatum. In the class confined to gentlemen's gardeners, the plants being arranged in a semi-circle of 12 feet (the same space as in the previous class), Messrs. Carr. A. Rober, and J. Wilkins, were the successful competitors with capital arrangements In the amateurs class, Mr J. C. Scamell, gr. to G. R. Kendle, Esq., Wilton, won the Silver Cnp, value £5, given by the Mayor of Salisbury, his group well deserving the honour bestowed upon it; Mr F. E. Pearce, Salisbury, taking 2nd place for an excellent arrangement.

Frait — Several good collections of eight kinds were staged Mr II. W WARD, Longford Castle Gardens, Salisbury, being Mr H. W WARD, Longitord Castle Gardens, Sansbury, being casily 1st, with good shaped bunches of Black Hamburgh and Muscat of Alexandria Grapes, fine in berry, and beautifully coloured; good Charlotte Rothschild Pine-apple, large well-netted Earl's Favourite Melon, extra good Sea Eagles Welliams' Bon Chrétien Pear; Mr. G. Inglefield, gr. to Sir John Kelk, Bart., Tedworth, Marlborough, taking 2nd place. Mr. H. W. Ward had the best three bunches of Muscat of

Alexandria Grapes, as well as the best three hunches of any other white, staging fine examples of Buckland Sweetwater, the berries in both varieties being large, even, and well-coloured. Mr. H. W. Milenells, Chilworth Manor, Romsey, was a good 1st for three bunches of Black Hamburgh in a good class, the bunches fine in size, and the berries grandly coloured. Mr Chalk, gr. to George Read, Esq., Westwood, wilton Road, Salisbury, was awarded I t prize for any other black Grape than Hamburgh, having large, handsome bunches of Gros Maroc, fine in berry, and farly coloured; while handsome bunches of Madresfield Court, fine in berry and finish, and perfectly ripe, were, singularly, accorded only a 2nd place

Mr. Fulford, gr to G. B. Worthingron, Esq., Dawerbam, had the best Mclon, and Mr. Milchell the best dish of Peaches. Mr. F SMITH seor d a victory in the class for three dishes of dessert Apples, showing perfect fruits of Beauty of Bath, Irish Peach, and Worcester Pearmain; the same exhibitor was let for culinary varieties. Mr. 1861-FIELD had the best dish of Apricots, with good fruits of Moor Park; and Mr. R. West, gr. to H. W. WYGRAM, Esq., North-lands, Salisbury, took premier position for four dishes of

Vegetables .- Three excellent collections of twelve kinds were staged by Messrs. T. Wilkins, H. Brown, gr. to Hon. Percy Wyndram, The Clouds, Salisbury; and E. Ford, The Island, Willon, who took the prizes in that order. The 1st prize collection, which was well ahead of the other two, included fine specimens of Autumn Giant Carliflowers, Perfection Tomatos, Ailsa Craig Onions, Telegraph Cucumbers, Duke of Albany Pea, Matchless Carrot, Ne Plus Ultra Runner Beans, Satisfaction Potatos, Giant White Celery, and Praynell's Beet.

Honorary Exhibits. - Collections of Dahlias (including many promising seedlings), Roses, and Asters were shown by Kevnes, Williams & Co., Salisbury. Mr. Laduams, Shirley, Southampton, had a fine display of choice herbaceous cut flowers, and Mr. BEDFORD a collection of Fuchsias.

HASTINGS AND ST. LEONARDS HORTICULTURAL.

Augu T 12 .- The great legitimate floral event of the season -for we cannot call the decoration of go-carts, and the pelting of the mob with Nature's most beautiful offerings legitimate-was held on the above date, amid the levely surroundings of Alexandra Park. It was doubtless a success, being favoured with lovely weather.

Gigantic specurea plants have been the rule at this show Gry gars, but these are happily replaced by smaller but equally meritorious examples of stove, greenhouse, and foliage plants; indeed, one seldom meets with higher coloured Crotons, or with Bongainvilleus with brighter-coloured bracts (an effect perhaps attributable to the sea breezes) than are here staged.

Grand specimen Ferns, being more portable, are still to the fore in examples of Davallia Mooreana, Microlepia hirta eristata, Adiantum Sancta Catherina, Blechnum braziliense all clean and healthy, showing evidence of good culture.

Cut flowers were not numerous, or of very high merit, the continued drought having spoiled the Roses and many other open-air species, but there were some good stands of decorative Dahlias, though the introduction of Asparagus among the premier exhibit was surely overlooked by the judges, and can hardly be admissible; while, on the other hand, the foliage and buds introduced by a well-known Crawley firm was both appropriate and legitimate.

Store and greenhouse cut flowers are always a feature here, and were quite up to their average excellence. The same may be said of the table decorations, energies, and baskets, almost all shown by local florists chaste colouring, and an almost aërial lightness being the distinguishing features. This was enhanced by a few "first attempts," we may charitably hope, of other exhibitors, who, if they aspire to prizes, have much to learn.

MAIDENHEAD HORTICULTURAL.

'August 13.—The nineteenth annual exhibition was held on the above date in the grounds of St. Ive's Place. The severe drought is responsible for a slight falling off in the number of entries in the vegetable classes, but taken collectively the exhibits were of high quality. The arrangement of the exhibition has also been very much improved, groups for effect and specimen plants being arranged on the grass instead of on ugly staging, as was the case formerly. On this occasion the effect would have been greater could a little more room have been given the specimen plants and Ferns. The special features of the show comprised the groups of plants arranged for effect, and some magnificent fruit and vegetables staged by several exhibitors, especially those staged by Mr. G Goodman, gr. to Miss Hammersley, Bourne End, who carried off the chief prizes for these.

Plants (Open) -In class 1, for twelve handsome foliage Plants (open)—In cross 1, for twelve handsome forage plants in seinch pots the competition was keen, and the subjects exhibited in each instance very good. Mr. J. Fulford, gr. to J. LAMBERT, Esq., Cookham, was awarded 1st prize for twelve good specimens, the best being Crotons Lady Zetland and Andreanus, Dracanas Cooperi and Amabilis, Cycas revoluta and Acalypha Macfeeana

With six stove and greenhouse plants, three flower and three foliage, there were only two competitors, Mr Altken coming Ist with good plants of Allamanda Schottii, Crotons Queen Victoria and Prince of Wales, and Phoenix rupicola, among others.

Stove and greenhouse Ferns in fine condition came from Mr. Altken, Microlepta hirta eristata, Adiantum Farleyense, Davallia Mooreana, Gymnogrammas Peruviana and Alstonii being good

For a single specimen foliage plant, also a flowering one, Mr. AITKEN was 1st, the foliage specimen being Croton Queen Victoria; the flowering plant being Allamanda Hendersoni.

Fuchsias were not so excellent as usual. There was only one exhibitor of six specimens, Mr. D. Paxton, gr to the Hon. C. J. In v., Hitcham Grange, Taplow, who was Hon. C. J. In awarded 1st prize

Tuberous Regonias made a good display, six exhibitors entering, with as many plants—Mr. Goodurun, gr. to Miss Hammershey, Abney House, Bourne End, was a good 1st, with large plants, well flowered; 2nd, Mr. Richardson, gr. to G. HERRING, Esq.

Zonal Pelargonomus, shown in sixes, made an imposing bank of colour; Ist, Mr. AITKEN, with plants over a yard in diameter, and well bloomed.

Classes for Cockscombs, Coleus, Glovinias, &c., were fairly well filled, but call for no special comment.

Undoubtedly the most interesting in the plant classes was group of plants arranged for effect to occupy a space of 12 feet by 12 feet by 10 feet. Here the competition was very keen between Messys. AITKEN and PHILLIPS, the prizes being eventually awarded in the order of their names. Both of their groups had a groundwork of Adiantum cuneatum, and a raised central plant of Cocos Weddeliana, while in the 1st prize group, the lower leaf-stalks of the Palm were draped with flowering sprays of Dipladenia Brearleyana. Mr. Atrace had arising from his groundwork hundsome Pancratiums, Cumpanulas (white), Crotons, Liliums, Francoa ramosa, Gloxinias, Gladiolus, &c., all very bright and

Smaller groups, half the size of the above, were put up by four exhibitors, Mr. FULFORD being an easy 1st. Mr. FULFORD

was also 1st for six tible plants, admirable specimens.

Cut Flowers.—Nurserymen: 24 Roses, distinct varieties.

1st, Mr. F. J. Fletcher, Lowbrook Fruit and Flower Farm, Maidenbead; 2nd, Mr. WALKER, Thame. With twelve Dahlas, Mr Walker was 1st; 2nd, Mr Tranter, Henley-on-Thames. The same two exhibitors occupied similar positions also in the two classes for Zinmas and Asters.

Roses, nurserymen excluded, twelve varieties, 1st, Miss BALLEY DENION, Winkfield For six bunches of Cactus Dahlias, distinct varieties, three blooms of each, six competi-tors entered, the 1st award going to Mr. H. G. Morris, Thame. Zinnias were largely shown, eight competitors staging good examples, 1st, Mr. D. Philips; 2nd, Mr. C. Young, gr, to the Rev. T. Coney. Asters were also fairly good, six competitors entering with twelve varieties, Mr. Ponj being 1st

Fraits - As before mentioned, the display of fruit was very Fraits—As before mentioned, the display of fruit was very good, some excellent Grapes, &c., being staged—For a collection of "six dishes (twelve fruits) of distinct kinds (Pines excluded), and only one of Grapes," Mr. Goodman, gr. to Miss Hammersley, Bourne End, scored an easy 1st, with every dish good and very meety set up—It comprised White Muscat Grapes, Bellegarde Penches, Stanwick Elruge Nectations (Eng. Rev. 1). riues (very fine), Brown Ischu Figs, The Countess Melon and Jefferson Plums; 2nd, Mr. Johnson, gr. to A. Gittur, Esp., Stoke Green, Slough
For four dishes there was only one exhibitor, Mr. D.

Paxton, who was awarded a 1st prize. For a similar numb grown in the open air, equal 1sts were awarded to Mr. Wood, and Mr. T. Dennes, gr. f. W. R. COOKSON, Esq.

Black Hamburgh Grapes were very good, the 1st and 2nd prize stands being almost of equal merit. Mr. Core was twarded the 1st position, and Mr. G. Lane, gr. to Miss S. A. Rinor, 2nd.

For any other black variety, Mr. Dennes was an easy 1st, with superb bunches of Muscat Hamburgh: 2nd, Mr. Cole, with Madresfield Court.

Of five competitors with White Muscats, Mr. DENNES was also 1st; and for any other white Grape, showing Buck land's Sweetwater.

JOHNSON was a good 1st with Grosse Mignonne Peaches, and Mr. DENNES with Nectionnes Mr. Jones with a green-fleshed Melon, and Mr. At sits with a sculetfleshed.

Plums, Apples, Cherries, and Pears were exhibited in good numbers, the principal winners being Messrs. Goodman, Davis, Panron, and Jourson

Frgetables,-Here the best produce was undoubtedly found in the competition for the special prizes offered by Messrs. Sutton & Sons. Mr. Goodwax was well 1st, having fine samples of Giant Rocca Onion, Autoriat Peis, Sutton's Per-fection Tomato, Autumn Mannoth Cauliflowers, Satisfaction Potatos, and New Red Intermediate Carrots, 2nd, Mr. Johnson. Mr. Goodman was also 1st for the best display of vegetables (the prizes given by Messis, Carter & Co.): he staged twenty-seven varieties in good condition; 2nd, Mr. Yorne, Prizes were also offered by Messis. Webb & Sons, for which Mr. Johnson was 1st.—A large number of single dish classes brought out, in most instances, strong competition.

Homovary Exhibits .-- Messis Laing & Sons, Forest Hill had a Homorary Etholds.—Messis 1.4183 & Soys, forest Hill, hold group of Begonias, Cannas, &c. Mrs. Brot office contributed wreaths, crosses, and a group of plants; Mr. Ferre 4fft, Roses and herbaceous flowers; Mr. E. F. Stein, Maidenhead, floral decorations; and Mr. W. H. Fitt, Windsor, wreaths and

TAUNTON DEANE HORTICULTURAL.

Accust 13 .- This was the twenty-ninth annual exhibition, and it took place, as usu v, m Vivary Park, which, since it became the property of the town, has been considerably improved, and made a public recreation ground. Altogether the purposes of the flower show has been greatly assisted by the change. The arrangements were excellent, the new Secretary, Mr. J. S. Winson, deserving great credit.

Two large tents were occupied by Divisions I, and II., consisting of plants and cut flowers; one was set apart for floral decorations, one to fruit and vegetables, and another to cottagers, and there was a honey tent in addition. There

was a very fine display all round.

Chief among the open classes was the collection of twelve store and greenhouse plants. Mr. JAMES CVEHER, of Chelt n-ham, taking the 1st prize with an excellent lot, having Ericas Aitoniana, Austiniana, and Thompsoni; Ixoras salietfolia and regina; Phoenocoma prolifera Barnesii, very fine; Statices Gilbertii and profusa; Clerodendron Bilfourianum, Bougainornicerti and product, Cetorican Britonian Information, Bougain-villea Sanderiana, Allamanda Hendersoni, and Rondeletia speciosa major. Mr. W. Fiscu, Coventry, who was 2nd, was stronger in Heaths than Mr. Cypher.

With six specimens, Mr. Cyrnen was again 1st; Mr. W. Row LAND was 2nd, his chief plants being Allamanda nobilis and Clerodendron Balfourianum.

So be very fine collections of eight fine foliaged plants were staged, Mr. Cypher taking 1st honours with splendid Kentias Fosteriana and australis; Latania borbonica, Crotons Sun-set, Thompson's, and Queen Victoria; a fine Pine of Cordyline indivisa and Cycas revoluta; Mr. Fiscal was a very good 2nd.

In the open class for a group, Mr. Rown and took the 1st prize with a light and elegant arrangement but the narrow. ness of the tent interfered with a thoroughly effective display. Mr. V. Slader, Taunton, was 2nd; and these exhibitors were 1st and 2nd with eight exotic Ferns, which were by no means up to the usual mark at Taunton.

With eight varieties of tuberous Begonias Mr Thorne, gr. to W. MARSHALL, Esq., Taunton, was 1st with finely-grown and bloomed specimens of excellent quality; Mr. H. Godding was a good 2nd. Capital specimens of zonal Pelargoniums were shown in the open classes, excellently grown, and currying heads of bloom of fine quality, Mr. H. GODDAN: taking the 1st prizes with six single and four double; Mr. A. J. Spiller was find.

The best newly-introduced plant with ornamental foliage was Croton bake of Buccleuch, f om Mr. Cyphen, the broad was Croton Purce of Buceleach, from Mr. Cypher, the broad golden leaves having five side lobes. The best newly-introduced flowering plant was Afrides Lawrenceanum, also from Mr. Cypher. The best Orchids were from Mr. W. Marshall. They consisted of Cattleys eldorado virginale, Cyprapedium Morganie, C. Spicerianum, and Cattleys intermedia; Mr. J. Cypher was 2nd, with Cychoches chlorochillum, Vanda corulea, Odontoglossum Harryanum, and Cattleya Harrisoni.

Open Class, Cat Flowers,-Mr J. Mattock, nurseryman, Oxford, took the 1st prize with thirty-six Roses, stiging some very good blooms for the season, of which the chief among them were La France, Marie Baumann, Horace Vernet, Duchess of Bedford, Mr. J. Laing, and Ulrich Brunner; 2nd, Messrs. Townsend & Sons, nurserymen, Worcester.
With eighteen varieties, Mr. Mattock was again 1st; and

Messrs Jarnan & Co., Ltd., Chard, were 2nd.

With twelve Dahlias, Messrs Townsenh & Son were lst; and Mr. W. Smith 2nd; Mr. H. Godding had the best six bunches of Cietus, and decorative varieties; Messrs, Town-SEND & Son 2nd. The best nine bunches of Pompons synt & Sov 2nd. The best time function of Folingons of uniffron Mr. J. Cording, gr. to W Filion, Esq., a very good collection indeed; Mr. W. James, gr. to Mrs. Macalester, was 2nd. Herbaccous Phloxes were also shown, but they were smaller than usual. German Asters were small, though nice and clean. Mr. C. H. Vickery took the 1st prize for twenty four French Asters; Mr. A. A. Wylters, florist, Bath, was 2nd.

Some very good spikes of Gladioli were shown by Mr. S. Bird, gr. to F. H. Fox, Esq. Phlox Drimmondii, shown in bunches, were charming—a long way better than the Verenas one is accustomed to see; and Hollyhocks are an immoving feature in the West.

Mr. W. Marshall, was 1st with twelve bunches of slove and greenhouse cut flowers; W. K. Wair, Esq., was 2nd. Collections of hardy percunials and bulbous plants were also a good feature.

Amateurs.- In the division for amateurs only, which also includes gentlemen's gardeners, Mr. Rowland again took the 1st prize with a tastefully-arranged group. He was also 1st with twelve stove and greenhouse plants, staging some good specimens, chief among them Clerodendron Bal fourianum. Stephanotis floribunda, Dipladecia amabilis, and some good specimen foliage I plants; Miss Fodd, South-ampton, was 2nd, Ixora Duffii being one of her most striking plants. With six specimens, Mr. W. Marshall took the 1st prize; and Mr. Rowland was 2nd. With four store and greenhouse plants in flower, Miss Todo was 1st, having good greenholes of Allamanda Hendersoni, Bongainvillea glabra Clerodendron Baifourianum, and a Dipladenia; Mr. W. Brock was 2nd.

Some good specimen foliaged plants were also shown in the class for six. Miss Toron came 1st with four Ferns, having in fine condition Dicksonia antarctica, Davallias Mooreana and Fijiensis, and Gymnogramma chrysophylla. Mr. W. Marshall was again 1st with four Orchids; Miss Toro taking the 2nd prize.

Japanese Lilies and Fuchsias were fairly well shown. Begonias, single and double, made a good display here as in the open division, and zonal Pelarg minms were very gay Coleus were represented by nice bushes; Gloxinias were good for the time of year; and there were classes for Petunias, Caladiums, Balsams, Cockscombs, &c

The Cutshover Classes were mainly similar to those in the open division. Mr. J. Lloyd, gr. to V. Stucker, Esq., was 1st, with twelve good spikes of Gladioh; and for German and Freuch Asters.

Mr. Macallister was 1st with twelve bunches of hardy perennials and bulbous plants, staging some subjects not often seen in such collections.

Dr. Bubb had the best twenty-four Roses, staging in good condition Mrs. J. Laing, Charles Lefebvre, Marie Verdier, Alfred Colomb, Marie Bermann, Madame Hoste, and Maréchal condition Mrs. J Niel; 2nd, Mr. Thomas House, Lower Easton.

FRUIT, Ere

The Finit Tent is always a centre of great interest at Taunton. The best collection of eight dishes came from Mr. J. Liovic, who had Museat of Alexandria and Madresfield Court Grapes, Hero of Lockinge Melon, Bellegarde Peaches,

Pine-apple Nectarine, Brown Turkey Figs, and Jefferson's Pine-apple Nectarine, Brown Turkey Figs. and Jenterson's Plum. Mr. H. W. Ward, gr. to the Earl of Rannor, Long-ford Castle, Salisbury, was 2nd, having Muscat of Alexandria and Black Hamburgh Grapes, in good form: fine Sea Eagle Peaches, and Castle Kennedy Figs. With six dishes, Mr. J. Webber, gr. to J. T. Luttrell, Esq. was 1st, with black and white Grapes, Melon, Crawford Early Peach, Pine-apple Nettering and Figs. 2nd Mr. M. Carrenter. and white Grapes, Melon, Crawford Early Peach, Fine-apple Nectarines, and Figs; 2nd, Mr. J. LLOYD. Mr. W. Carpenter, gr. to A. R. Balley, Esq., was 1st with three fine bunches of White Muscats; Mr. Ward was 2nd, with beautifully-finished examples. Mr. LLOYD had the best three bunches of Black Hamburgh; Mr. S. Kidley, gr. to W. A. SANFFORD, Esq., was 2nd; both exhibits somewhat poor in colour. Other white Grapes were mainly Foster's Seedling; any other black was represented by Madresfield Court, all good; Mr. R. CARTER 1st, and Mr. A. Crosseman, gr. to J. BRUTTON. Esq., 2nd. The best dish of Peaches was Crawford's Early. Plums,

both dessert and culinary, were in plenty; and there were good Apples, Pears, and Cherries, as well as bush fruits.

Vegetables were shown well. Mr. Wilkins, gr. to Lady T. Guest, Hemsbridge House, was 1st with eight distes, showing specimens of the finest quality; Mr. J. Aldworth was 2nd. Mr. Wilkins also went the let Mesers Suiters is Series. ing specimens of the finest quality; Mr. J. Aldworth was 2nd. Mr. Wilkins also won the 1st Messrs. Sutton & Sons' special prizes for six dishes; Mr. E S Daas was 2nd, and he was also 1st in Messrs Jarman & Co.'s class for twelve dishes; Mr. Brax was again 2nd. There were a great many classes for single dishes, Runner Beans, Carrots, Parsnips, and Cauliflowers were especially fine. Potatos were largely in evidence, and were shown in several classes, but generally

over-large, yet smooth and clean.

Among miscellaneous collections, Messrs. Kelway & Son, Langport, had a very fine collection of sixty spakes of Gladioli. Mr. R. T. Veitch, of the Exeter Nurseries, a large collection of plants, cut flowers, &c. of a very interesting character; and Messrs. January & Co., Chard, one of a similar character.

SEVENOAKS HORTICULTURAL.

August 12.-The twenty-ninth annual exhibition in connection with the Sevenoaks Horticultural Society was held on the above date in the historic grounds surrounding Knole House, the residence of Lord Sackville. The private gardens of Knole were also thrown open, and proved a great source of attraction. The show itself was a very great success, the exhibits being of excellent quality.

A large tent set apart for groups of plants arranged for effect contained many exhibits of a pleasing and satisfactory nature. The table decordions were also graceful and effective. Fruit in all classes was exceptionally fine. Competition ruled keen all through the cottagers' classes. The Town Band supplied the musical programme.

Amongst the principal prize-winners were Mr. C. Sutton, gr. to Earl Stanbore. Mr. Heath, gr. to Mrs. Petter; Mr. Fennell, gr. to Mr. W. CAZALET, Fairlawn; Mr. Potter, gr. to Sir Mark Collett; and Mr. flatton, gr. to Mrs. Swanzy. Mr. Hatton won the Star of Honour awarded by NEWADEN. Mr. HATTON won the Star of Honour awarded by Messrs Cannell, of Swanley, for the best collection of vegetables, fruit, flowers.

TROWBRIDGE HORTICULTURAL.

August 19.-This, one of the oldest societies in the district, held its yearly exhibition on the above date in the flower show-field adjoining the railway station; and, as is customary, the town was gaily decorated, and at certain points triumphal arches spanned the streets. It is always a very popular gathering. Unfortunately for the Show Committee, though happily for the county of Wilts, which sorely needs moisture, rain began to fall about noon, and continued all the afternoon. Notwithstanding, the attendance was good. Fuchsias, hitherto a prime feature at Trowbridge. this season, owing to various causes, fell below their usual level of quality, much to the regret of the Trowbridge folk.

Store and Greenhouse Plants were well represented, though show that Syamous Plants were well represented, though the prizes are low. There were three collections of nine specimens in flower. Mr. H. Matthews, gr. to Sir W. R. Brown, Et., Trowbridge, was 1st with well-developed Ericas Eweriani elegans, and Austiniana; Bongainvillea glabra, Dipladenias Brearleyana and amabilis, both finely grown and bleaded tell. and bloomed. Clerodendron Balfourianum, Ixora coccinea, very fine, and I. Pilgrimii, and others. Mr. Geo. Tucker, very nite, and f. Phigrinni, and others. Mr. Geo. Picker, gr. to W. P. Clark, Esq., Trowbridge, was 2nd, having excellent specimens of Ericas Autoniana turgida, and McNabiana, Ixoras Morsei and Fraseri, very fine; Dipladenia Brearleyana, Allamandas Hendersoni and nobilis, Bengain-Brearlyana, Anamanas Henderson and noons, Bengam-villea glabra, &c. Mr. Geo Tucker was 1st with six spec-mens, chief among them Allamanda Hendersoni, Bougain-villea glabra, Eucharis grandiflora, &c.; Mr. H. Matthews was 2nd; Mr. ucker was also 1st with three plants. The best specimen plant was a capital Croton Sunset, from Messrs, E. Cole & Sons, Nurserymen, Bath.

Groups arranged for effect showed a marked improvement;

it is a feature of the Trowbridge show which needed develop-ment. Mr. G. Pynom, gr. to Mrs. Goversmith, Trowbridge, set up an arrangement, light, and graceful, which exhibitors in the future will be certain to copy; better grown stuff could scarcely be used for the purpose. A large flowered A large flowered

form of Browdlia afforded some charming touches of blue Flowering plants in pots included Fuchsias, Mr. G. Tucker being 1st with six, and also with four, the specimen much finer than is usually seen at shows; Heaths not so good as usu d ; Achimenes, Gloxinias, Zonal Pelargoniums, very finely grown and bloomed, and Petunias. Some remarkably good Tuberous Begonias were shown by Mr. C. Rickman, gr. to W Tuberous Begonnas were shown by Mr. C. Rickman, gr. to w G. Palmer, Esq., Trowbridge, who was 1st with the best six single specimens, and also with six doubles, which we have seen this season. Mr. H. Mattnews had the best four Orchids, having two Cattleyas and Phalanopsis amablis and Schilleriana, all well flowered.

Of Foliaged Plants, Messrs, E. Core & Suns had the best nine, which were admirably staged; they consisted of fine Kentias australis and Porsteriana, Areca sapida, Crotons Williamsii and nobilis, &c. Mr H, Matthews was 2nd, his Williamsh and nobles, &c. Mr. H. MATTHEWS was 2nd, his leading specimens being well-coloured Crotons excelsa, Kentia Porsteriana, &c. Collections of fifteen Ferns and Mosses, were not large but in the form of good useful decorative specimens, Mr. GEO. TUCKER was 1st, and Mr. J. Coke, gr. to A. P. STANCOME, Trowbridge, 2nd.

Cut Flowers are always well represented at Trowbridge, and Roses were especially good. With twelve trebles, Mr. J. Mattock, Nurseryman, Oxford, was 1st; chief among them were Marie Van Houtte, A. K. Williams, Souvenir d'Elise Valdon, he Bride, Horace Vernet, Alfred Colomb, Mr. J. Laing, &c.; the Tea Roses being especially good. Dr. Budd, Bath, was 2nd. Mr. Mattock was also 1st with twenty-four varieties, having some remarkably good flowers for the third week in August: among them were Ernest Metz in excellent form, Star of Waltham, Souvenir d'Elise Vardon, The Bride, Horace Vernet, Alfred Colomb, Pierre Notting, Innocente Pirola, Marie Van Houtte, &c. Messrs. Geo. Cooling & Sons, Nurserymen, Bath, were 2nd. With twenty-four blooms of Ter Scented (duplicates permitted), Mr. Mattock was again 181 seemed (unphoties permitted), Mr. MATTOCK was again 1st with charming flowers. In the amateur division Dr. Bupb was lat with twelve treb'e and twelve single blooms; Mr. W. Bates, Chippenham, being 2nd in both classes.

Dahlas were more extensively shown than has been seen at Trowbridge for years. With twenty-four varieties, Mr. John Walken, nurseryman, Thame, was 1st, and Mr. W. SEALE, Sevenoaks, 2nd With twelve varieties, Mr. F. Lindsay, Frome, was 1st, and Mr. S. Cooffer, Chippenham, 2nd, With twelve Fancy Dahlias, Mr. J. Walker was 1st, and Mr. Seale 2nd Single varieties in twelve bunches were charming: here Mr. Seale came in 1st, and Mr. Truckle, gr to T. Carr, Esq. Bith, was 2ud. The Pompon varieties in twelve bunches were very good also; Mr. Seale again 1st. A stand of twelve bunches of Cactus Dahlias from Mr. Scale were a fine feature, such varieties as Lady Penzance, Mrs. Wilson Noble, Bertha Mawley, Countess of Radnor, and Apollo were in their best form

FRUIT AND VEGETABLES

Of Fruit there were three collections of ten varieties; Mr. W. Strugnell, gr. to the Rt. Hon. W. H. Lone, M.P., Rood Ashton, was 1st with excellent Alicante and White Muscat Grapes, Sea Eagle and Bellegarde Peaches, Humboldt Nec-turines, Hemskirk Apricots, Brown Turkey Figs, Beurre St Louis Pears, Jefferson Pluins, and Melon; 2nd, Mr. Goo. Pymin, gr. to Mrs. Gouldsmith, who had well-finished Black Hamburgh and Muscat of Alexandria Grapes, very fine Exquisite and Dymond Peaches, Pine Apple, and Humboldt Nectarine, &c. With two bunches of black Grapes, Muscats excluded, Mr. Thos. Jones, Bath, was 1st, and Mr. James Forte, Lath, 2nd, both with good Flack Hamburgh. The best two bunches of white grapes, other than Muscats, were Foster's Seedling from Mr. J. FORTT: Mr. J. ATWELL was 2nd with Buckland Sweet water. The best two bunches of Black Museats were Madresheld Court from Mr. H. Clack, gr to C. E. Colston Fsop, Roundway Park, Devizes; Mr. Smith, gr. to the Bishor of Salisbury, being 2nd with the same. The best two bunches of white Muscats also came from Mr. FORTE; Mr. Carpenter, gr. to T. A. Bailley, Esq., Frome, was 2nd

Green Gare Plams were numerously shown and in fine Green Gage Franks were Balacters, the best descert Plum was Kirkes, from Mr. H. Pocock, Hilperton; Mr. T. C. Beull, Crediton, was 2nd, with, a fine dish of Jeffersons—Cherries were represented by Morelbas, some very good fruits being staged. The best dish of Peaches was Noblesse, from Mr. T. Jones; Mr. Gio. Pymm coming 2nd with fine Bellegarde. Pine-apple was the best Nectarine, and won for Mr. H. Clack the 1st Prize; Mr. Strugnell, gr. to the Rt. Hon. W. H. Long, Esq., M. P., Rood Ashton, was 2nd. Mr. Geo. Garraway, Bath, had the best two dishes of dessert Apples, having Lady Sudeley, and Worcester Pearmain. Mr. Swith had the best two dishes of cester Fearmann Mr. Swith had the best two dishes of culmary Apples, staging very fine Peasgood's Nonsuch and Eckhinville; Mr. Strubsell, was 2nd with Warner's King and Stirling Castle Mr. Geo, Gabraway had the best two dishes of dessert Pears. Mr. Smith was 2nd.

Vegetables were, as usual, numerous and very good.

Miscellamous Collections,—Messrs, George Cooling & Sons staged a charming collection of garden roses; and also blooms each of their two new H. Ps., Bladud and Laurence Allen, which are said to be excellent autumn bloomers. Messis, Keynes, Williams & Co., nurserymen, Salisbury, had some highly promising Cactus Dahlias.

SHROPSHIRE HORTICULTURAL.

Argust 19, 20. - The excellence of this well-known annual exhibition was fully maintained on this occasion. It was, in fut, admitted by those who have for several years frequented this gathering, that no finer show has been previously held at Shrewsbury. This was noticeable throughout all of the sections.

In the plant classes the groups were the leading feature,

and surpassed those of last year, whilst the competition was keener, there being but little difference in quality between some of them. Specimen flowering and foliage plants in the 1st prize collections were all that one could wish, but there was a slight falling off in the competition in the larger classes.

The cut-flower classes were filled surprisingly well, notably those for hardy border flowers Dahlias, Sweet Peas, Roses, and Carnations also made a fine display. The decerative classes were of the highest excellence. In several of the cut-flower classes the northern growers were exceedingly strong.

The fruit classes throughout betokened high merit. This was noticeable in Grapes as well as in stone fruits; the competition in the former classes was remarkably kcen.

The combined exhibits of fruits and flowers were, from a decorative point of view, a decided [success, being not only novel and interesting, but instructive also. The one most noticeable defect was a tendency to overcrowd the tables.

The collections of fruits, flowers, and vegetables combined were not so decided a success; each exhibitor could have filled twice the space to better advantage with the exhibits staged.

The vegetable classes were fully up to the high standard always seen at Shrewsbury. The non-competitive trade exhibits were most extensive, these adding greatly to the interest of the show, both plants and cut flowers being strongly en évidence.

PLANTS.

For a group of miscellaneous plants, in or out of bloom. arranged to produce the best effect, to occupy a space of 1000 square feet, Mr. J. CVFHER, Queen's Road Nurseries, Cheltenham, was a splendid 1st with a tasteful arrangement in which the colours blended most harmonieusly, whilst there was not any semblance of overcrowding, the plants, too, being admirable; a well-balanced Phoenix rupicola occupied the central position, it being supported by two light arches, these being well clothed with suitable plants, as Tupolisius, Oncidiums, Asparagus, and Panieum variegatum, with Lilium Harrisi at the base of the arches, these reposing on a bed of green moss. Well-coloured Crotons made splendid "dot" plants, as also did Cocos Weddeliana; whilst such Orchids as Vanda cerulea, Dendrobium Phalesnopsis Schrederianum, and light Odontoglossums, with Onei-diums, notably O. Jonesianum and O. flexuosum, with here and there a good example of Cattleya Gaskelliana, added to the effect. Mr. Chas. J. Mer. Nottingham, was a good 2nd, and that, too, without any great assistance from Orchids; a talk Kontia occupied the centre, various Lilies, with some good tufts of Lily of the Valley towards the front, enhanced the effect; Cattleya crispa was also noticeable, and of other foliage plants. Acalypha Macfeeana, Cocos plumosus, and Bamboos. Although not overcrowded, there was a suspicion of heaviness as a whole. Mr. Edmonds, gr. to the Duke of St. Albans, Bestwood, Notts, came 3rd in this closs, the plants showing some traces of travelling, to their disadvantages and the first as a whole was hold and graph and the contract of the country tage; the effect as a whole was bold and good; a few-more dwarf plants as a earpeting would have improved Three other prizes were awarded in this class.

In the large class for twenty stove and greenhouse plants, not fewer than twelve to be in flower, Mr. J. Cypher was again the winner, and that in an easy fashion. Of feliage plants he had as a background huge examples of Kentia pants he had as a background nog examples of kental Forsteriana and K. australis, Cycas circinalis was also a perfect specimen; in front of these were finely-coloured examples of Croton augustifolius, C. Johannis, C. Queen Victoria, and C. Sunset; the flowering plants being towards the front and at each end, these consisted of finely flowered Ixoras as I. Pilgrimi, I. regina, and I. Williamsi, Rondeletic speciosa major, a grand plant and one seldom seen so good, being one mass of flower; Phoenocoma prolifera Barnesi, well studded with bloom; Erica Eweriana, and E. obbata purpuren, both good; Allamanda nobilis, Clerolendron Balfourianum, and Bougainvillea Sanderiana, being also telling plants; Mr. Fince, nurseryman, Coventry, was 2nd in this

Mr. Cypher was also lst for six flowering plants, showing as his best Rondeletia species; major, Ixora regina, Statice Gilberti, and Pho-nocoma prolifera Barnesi; Mr. Finen was again 2nd, his best being Erica Lindleyana and Ixora Williamsi.

For six plants open to the county of Salop only, Mr. Lambert, gr. to Lord Harleen, Frogyntyn, Oswestry, showed well, staging a very freely-flowered Dipladenia amabilis, to good Ixora Prince of Grange, and a hugs plant of Area. lutescens.

Mr. Cyfhek was also 1st for six foliage plants, showing a grand plant of Cordyline indivisa, Croten Thompsoni, and C. Sunset in beautiful colour, also two good Cycads. Mr. Finch, who followed, had Bracena Douceti, very good.

The best six exotic Ferns were staged by Mr Roberts, gr. to P. A. Muntz, Esq., M P., Dunsmore, Rugby, his finest being a good example of Adiantum Farleyense, also one of A. cardioculoma, and a fine plant of Microlepia hirta cristata. Mr. Price, gr to T. Parkinson, Abergwill, was a good 2nd, Davallia Mooreana and Phlebodium aureum being the best,

Mr. LAMBERT had the best flowering specimen plant in Dipladenia amabilis, not a large plant, but with fine blooms, freely produced. The next best was Bougainvillea glabra-from G. Buer, Esq., Oaklands.

For the most meritorious flowering or foliage p'ant not in

commerce previous to January I. 1896, a Silver Medal each was sonia iridifolia Ardernei, pure white, with long, branching spikes and strong growth; and to Mr. J. Cypner for Statice intermedia (S. profusa & S. Holfordi), a distinct cross between these two varieties.

Mr. CYPHER had the best six Orchids, very good for the ecason, Lelia crispa, Odontoglossum Harryanum, Cycnoches chlorochilum, and Cattleya Gaskelliana being the best. Mr. Edwards, gr. to E. Stanley Clark, Esq., Oak Alyn, Wrexbam, was 2nd.

Mr. Lambert was 1st for six Dracamas, with well-grown plants in robust health, D. Baptisti and D. Thompsoni being the best. Mr. Leith, gr. to J. B. Greatorex, Esq., Mytton Hall, was 1st for six Caladiums: the plants were well furnished, C. Leopold Robert being one of the best, Mr. Lawley, gr. to Mrs. R. Darby, was a close 2nd in this class.

Coleus were shown remarkably fine, each of the four exhibits being admirable in every respect. Mr. Brennnell, gr. to H. F. Hayhurst, Esq., Overley, Wellington, was 1st.

Mr. Jones, gr. to A. M. Barber, Esq., Field House, Wellington, was 1st for tuberous Begonias; and Mr. Clift, gr. to R. TAYLOR, Esq., Abbey Foregate, 2nd, both showing dwarf, well-flowered examples.

Both single and double Zonale Pelargoniums were shown In splendid condition, the plants of medium size, but flowered in profusion. Mr. Myers, Satton Lane Nursery, Shrewsbury, was 1st in both instances; and W. J. Scott. Esq, 2nd, the latter showing well.

The class for table plants was the subject of keener competition, Mr. Mez being 1st with light, well-furnished dwarf plants; and Mr. Bellis, gr. to Sir C. H. Rouse Boccautos, Dowoton Hall, a good 2nd.

In the small group class, Mr. Ingwood, gr. to T. F. Kynnersley, Leighton Hall, Ironbridge, was 1st; Mr. Bremmell, 2nd; but both of these exhibitors might take pattern of the groups in the open class.

CUT FLOWERS.

For a display of floral arrangements in a space of 12 feet > 5 feet, any design of flowers admissible, Messrs. PERKIN: & Sons, Coventry, were invincible; that they never staged a finer exhibit was the opinion of many, and in confirmation of this a Gold Medal was awarded in addition to the 1st prize of £12 10s. All of the various designs shown were in this firm's usual excellent taste. Messrs. JINKINSON & SON, Newcastle, Staffs., staged well for the 2nd prize, the merit of this exhibit being further recognised by the award of a Silver Medal; Messrs, Jones & Son, Shrewsbury,

Mesers, Perkins & Son had the best pair of bouquets, one ball and one bridal, both being nearly perfect in the arrangement and blending of colours; Messrs, Jones & Son were 2nd, and showed very well.

In another and similar class Messrs. Pore & Sons, Birmingham, were 1st, their examples being a trifle heavy.

The last-named firm showed well, however, in a class for a shower bouquet of Cactus Dahlias, their choice being Countess of Gosford alone, with suitable foliage; the effect was beautiful,

In a similar class for Sweet Peas only, the 1st prize went to Messrs. Jekkinson & Son, but this award was open to question, Messrs. Pore & Son having a far more tisteful arrangement.

The best stands of cut flowers for the table were from Miss KETTLE, Market Drayton, a good arrangement in the usual style of glass epergnes; and another, much too thin to be effective, from Messrs. Jenkinson & Son.

Messrs. Perkins & Son, as usual, were 1st for button hole bouquets, and also for a collection of Roses in various designs and in boxes, those in baskets being very effective.

The finest exhibit of Gladioli came from Messrs. HARK-

NESS & Sons, Bedale; the varieties were of the very best, and the spikes particularly fresh and good; two of the best kinds were Enchantress and Grand-rouge.

The best collection of Dahlias came from Mr. M. CAMPBELL, High Blantyre, N.B., the Cactus vars. being specially good in every way; Harmony and Earl of Pembroke were very effective. Messrs, Jones & Son, Shrewsbury, were a good 2nd.

Mr. Mortmer, Rowledge, Farnham, won easily for twenty-four Dahlias, show and fancy varieties. Mr. Davies, gr. to W. K. Kingley, Esq., being 1st in each of two classes for bunches of Cactus Dahlias with the best known kinds.

For a collection of hardy flowers in variety (bulbs not admitted), Mr. CAMPBELL was a worthy 1st, he staging a great variety of the best things in season, including several

of the early Chrysanthemums; Mr. F. W. Gunn, Orton, Birmingham, was 2nd.

Messrs Il ukness & Sons were 1st for the best collection of bulbous flowers, this exhibit being strong in the best of the Gladioli, notably in the Lemoinei and Narcissus hybrids, also in Lilies, Montbretias, and Tigridias. Messrs. Wallace & Co., Colchester, were 2nd, with a choice but not so effect tive an exhibit.

The best collection of Carnations and Picotees came from

Mr. Cambell, these being displayed to the best advantage
Messrs. Prinkins & Sox staged an excellent exhibit of
twenty-four Roses, and were easily 1st in the open class,
Mr. Townsend, gr. to Col. R. T. Luoyp, Oswestry, was

181. Formsend, gr. 10 Co. R. L. Former, Oswestry, was 1st in the county class for the same mumber.

Mr. Lamberr had the best box of exotic cut flowers, being strong in Dipladenias and Ixoras.

The class for Sweet Peas was a strong one, Mr. Sankey, Baschurch, Salop, being 1st, showing the best and newest kinds; the arrangement being tasteful and natural,

In the class for a decorative dessert-table, not to consist of In the class for a decorative dessert-table, not to consist of more than sixteen dishes of fruit, for which prizes to the value of £15 15°, £12 12°, £8 8°, and £5 5°, were offered, there were five exhibitors. Mr McIndoe, gr. to Sir J Pewer, Bart., M.P., Hutton Hall, Guisboro', was 18t, showing good bunches of Golden Champion, Black Hamburgh, Muscatt of odnens of conden Campion, Back Raimongh, suscent of Alexandria and Gros Marce Grapes, Prince Affred and Invincible Melons, good Moorpark Apricots, Sea Eagle and Stirling Castle Peaches, Smooth Cayenne Pine apple, Doyenne Bossouch, and Souvenir du Congrès Peurs, Dryden and Elroge Nectarines, Brown Turkey Figs. Oullin's Golden Gage Plums, two nicely-coloured plants of Castley interpretations of the Alexandria and Castley and Castley in the Castley Cast Croton interruptus, with centre-piece of cut flowers, in-cluding Orchids, &c., internaxed with Ferns, together with eight small glasses theur on either side) filled with suitable flowers, showing off to advantage (pinety six and a half points); Mr. Gleeson, gr. to C. E. KEYSER, Esq., Stammore, was a good 2nd, his floral decoration being ahead of the 1st prize collection, but the fruit was not so heavy as that put up by the winner of the 1st prize (ninety-two and a half points being awarded to the 2nd prize collection); Mr. Goodaere, gr. to the Earl of Hammoton, Elvaston Castle, was a good 3rd, seeming eighty-eight and chalf points.

Five collections of twelve dishes were shown in good style.

Mr. Harris, gr. to Lady H. Sompeser, was 1st, showing good bunches of Black Hamburgh and Museat of Alexandria Grapes, Eastnor Castle Melon, Barrington and Royal George Brawn Turkey Figs, Kirk's and Washington Plums, and Bigarrean Cherries; 2nd, Mr. McInnor, with Golden Champion rather green), and Gros Maroc Grapes, Queen and Cayenne Pines, good Invincible, and Exquisite McIon, Victoria, Inc. 19 lette Hative Peaches, and Spenser Nectarmes; Mr. Goodevere

Nine collections of nine dishes (confined to exhibitors residing in Sa'on) were tabled, the 1st prize being secured by Mr. Lingh, gr. to Rev. F. M. BULKELEY OWEN, Teasmore Hill, Freton: Foster's Seedling and Madresfield Court Grapes, Royal George and Grosse Mignonne Peaches, Jargonelle Pear, Prince Engelbert Plums, Lockinge Melon, and Morello

Grapes. About 100 bunches of Grapes were shown, most of these being of a high order of excellence. There were eleven stands of four bunches of black Grapes in two variaties, Mr. Campbell, gr. to C. E. Newton, Esq., Micklow Manor, Derby, was a good 1st, staging grand bunches of Gros Maroc and Black Hamburgh, fine in bunch and berry; 2nd, Mr. Lumbert, gr. to Lord II values. Oswestry.

A like number of bunches of white, in two varieties, were

staged. Mr. McDonald, gr. to Captain Marcine, Canna. Sydney, Gloucester, was a good list, staging fine bunches of Buckland Sweet Water and Canon Hall Museat.

Eighteen stands of Black Hunburgh were shown in tine form generally; 1st, Mr. George Downes, gr. to Rev. F. ANDERSON, Gamnor Hill, Welsh Franklin; 2nd, Mr. Hughes,

gr. to R. Ltovp, Esq., Oswestry

Eleven stands of Madresfield Court were put up in capit d tendition, Mr. Craves taking 1st with fine solid bunches, good in berry and finish (Mr. Grav, Bodorgan, Anglesea,

being a creditable 2nd.

Twelve pairs of black Alicante were shown, Mr. Goodegens taking 1st with perfect bunch 3; Mr. C.A. Bayford, gr to C. Lie Campbella, Esq., Glewston Cou t, being a good 2nd.
Of ten stands of Gros Column put up, those from the Rev.

J. Andreson were the best; Rev. Bulkeley Owen a creditable 2nd.

Twelve pairs of Museat of Alexandria were put up, and Mr. Covres, Dumba'l Hall, Wansford, was a capital 1st, with medium sized, well coloured bunches; J. Taws, Esq., The Hayes, Stone, being a good and.

Twelve pairs of any other white were also shown; Mr. A. H. Hatt, Presbury, Macelesfield, was 1st, with Foster's Seedling; Captain Marriage being a good 2nd, with Buck-

The Rev. F. Anderson took 1st place for Black Hamburghs among nine exhibitors. Sever il stands of any other black Grape were staged, and the Kev. Bulkeley Owen was the hest exhibitor.

Melons, -that of thirty-three green-fleshed Melons staged, Mr. LAMBERT was 1st, with a good fruit of Carter's Earl's Favourite. Twenty seven scarlet-fleshed varieties were stagged. and a fine fruit of Blenheim Urange secured 1st prize for Mr. INGWOOD, Leighton Hall, Ironbridge.

Peaches.—Twenty nine dishes of Peaches, all of fine size and quality, were stigged. Mr. Harris, gr. to La ty Henry Southset, Eistnor Castle, was 1st, with fine fruits of Burrington, beautifully coloured; Mr. Dyke, gr. to Gro. Neville, Esq., Satton Hall, Newark, was 2nd, with the same variety; and Mr. Wilkes, 2r. to Mrs. Meykin, Creswell Hall, Stafford, was 3rd, with Boyd George.

Twenty-eight dishes of Necturines were staged, Mr. Tro-wood taking 1st with a beautiful dish of Violette Hative; WILKES following with fine examples of Improved Downton.

Apricots. - Thirty-two dishes of Apricots made a good stow, Mr. J. LAMBERTbeing a good 1st with clean fruits of Moor Park,
Mr. Robinson, Brampton Errin Hall, Hereford, following with good fauits of the same variety.

Plans.—Mr. McIndoe had the best out of twenty-five dishes staged, showing a fine dish of Green (fage. In the corresponding class for purple or red varieties, Mr. LANGLEY was 1st with a fine dish of Prince Englebert; Mr. NOWELL, Maindiff, was a good 2nd, with nie even fruits of Goliath.

Apples.—Twenty-five dishes of culinary fruit were staged and Mr. W. E. King was 1st with Warner's King. Leominster, took 1st prize with a fine dish of Ludy Sudeley (dessert).

Pears. -Mrs. W. Sandford, Port Hill, had the best dish of Pears out of fifteen dishes shown, with splendal fruits

Clapp's Favourite.

For the best-arranged collection of garden produce to occupy a space of 8 feet by 5 feet, plants and flowers and vego tibles to be represented, eight collections were arranged. Waite, gr. to Col. Talbot, Glenhurst, Esher, was placed 1st his Waite, gr. to Col. Tallor, Glenhurst, Esher, was placed ist his collection scoring 80½ points. It was an arrangement enclosed by brightly-coloured Crotons, Palms, and spikes of Planeratum fragrans, the same, together with Palms and Asparagus (common), forming the background, a glass standbeing placed in the centre. Peaches, Apricots, Nectarines, one Melon, four bunches of Grapes, Potatos, Tomatos Onions, Runner Beans, Celery, and Caulillower being arranged on a bed of moss and Asparagus, with Tubersse and a spike of Colontoglossum crispum; Mr. Goolacre was 2nd, his colle tion obtaining 81½ points; Mr. Mac Indoe was 3rl, with 81 moints. 3r l, with Signoints. VEGETABLES.

Fourteen collections of nine kinds were put up in comrourceen concertons of time kinus were put up in competition for Messrs. Sutton & Sons' prizes, Mr. Wilkins praying victorious, showing fine Caulittowers, Onions, Catrots, Tomatos, Duke of Albany Peas, A 1 Runner Beans, Prizetaker Leck, and Giant White Celery, the whole being admirably set up; Mr. Porf, Highelere Castle, Newbury, was a contributed.

was a capital 2nd.

Four collections of eight kinds were in competition for

Messrs. Were's prizes. Here Mr. Pore turned the tables on his antagonist in the previous class.

Tomates were, like all sections of vegetables, shown in large numbers and well. Mr. Let-u, Mytton Hall, Shrewsbury, was 1st for perfect examples of Sutton's Perfect on; and Messrs, Pritcuard & Sons' special prize class, Mr. PARKINSON Was 1st.

Cocumbers were shown well. Mr. Pork secured 1st prize with a pair of grand fruits of Carter's Model; Mr. Wylen-norse being 2nd with Lockie's Perfection.

nonse using and with Lockie's Perfection.

Prox made a good show for the time of year. Mr. Gro.

Livis, Pool Parva, was 1st in Mr. Eckronio's Special Prize

class, with fine, well-filled pods of Eckford's Prior, out of

six lots shown. In another class, Mr. E. Communication, High Street, Silverdale, was 1st.

Fromh and Romer Bones, "Twenty-seven dishes of the

Mr. Proef, gr. to Hon. Mrs. Kenyos, Whitehurch, was 1st with Canadi in Wonder French), and Mr. Poer was 1st with Sutton's Best of All Runner.

Furnips, Carots, Onions, Celery, and Parsnips were shown extensively and well.

P. tot. s. These were exhibited in great numbers, the tubers

being of good size, clean and even. Six collections of six varieties were staged. Mr. ENOCK CEMBERBUCH was 1st, showing perfect roots of Challenge, Reading Russett, Monarch, Pink Perf ction, Peerless Rose, and Reading Grant. Fifteen collections of three varaties were put up, and Col. Kexvos. Stendar, II itton Grange, was 1st.—Twenty-one single dishes were staged, Satisfaction t. king. 1st puze for R. L. Kexvos, Esq , Oswestry.

risq, yearsesty.

In Messrs, James Carter & Co.'s special prize class for Melons, Holborn Favourite secured 1st prize for Mr. Waite in a good competition.

MISCELLANEOUS NON-COMPETITIVE EXHIBITS.

These were numerous, and of excellent quality. The premier place must be accorded to Messrs, Sutron & Sons, premier place flux to a defined to be a wind who were awarded two Gold Medals, one for their Reading strain of tuberous Begonias, and another for their wellknown choice strain of Gloxinias. Of the former the exhibit was most extensive, and of the best possible quality, the individual blossoms being of enormous size (both of singles and doubles). These plants were only six months old from the seed, the growth dwarf and robust, notably in the singles; these latter were grouped in colours with the best possible effect, notably the deep crimson, the pure whites possible energy notably the deep crimson, the pure whites (very fine), the pinks, the rose-pinks, mixtures also being staged; the buff-coloured, the yellow, the pinks, and the approximated from amongst the doubles, were specially fine. The effect of the Gloxinias was also excellent, these, too, the colour of The effect of the Choximas was a so exceeded, these con-being ruised from seed this year. A choice strain of dwarf Phlox Drummondi was also included in this exhibit, and likewise of the Marguerite Carnations. The whole was stuged in two marquees, exclusively devoted to this exhibit,

staged in two marquees, exemistery devoter to this extraction the interior arrangements being admirable and unique.

THE PAST WEEK

THE following summary record of the weather throughout the British Islands for the week ending August 15, is furnished from the Meteorological Office:—

"The weather during this period varied considerably; over central and south-western England, and in Southern Ireland. it was generally fine and dry, while in most other places dull and rainy conditions alternated with fine dry intervals. Sharp thunderstorms were experienced at many of our south-eastern and eastern stations during the early days of the week, and in the north-eastern districts towards its

"The temperature was almost identical with the mean. "The temperature was almost identical with the mean. The highest of the maxima were recorded during the middle part of the week, and ranged from \$1' in England, S. and 77'in England, E., 'the 'Midland Counties,' and 'Scotland, E., to 60 , in 'Scotland, E., and 'England, N.W. The lowest of the minima were registered on rather irregular dates, and ranged from 33' in 'Scotland, E.,' and 35 in 'Ireland, N.,' to 50 in 'England, N.W.,' and to 50' in the 'Channel Islands'. Islands.

"The rainfull varied a good deal in different parts of the Kingdom, but was less than the mean in all districts. In the 'Midland Counties,' 'England, S.W.,' and 'Ireland, S.' the fall was very slight, while in some parts of Scotland, and in the south of England it nearly approached the mean

amount.

"The bright runshim exceeded the mean in most of the western parts of the Kingdom, but was deficient in all the transfer and deficient.

The nerven age of the possible dura more eastern districts—The percentage of the possible duration ranged from 57 in the 'Channel Islands,' is in 'England, S.W.,' and 47 in 'Scotland, W.,' to 23' in 'England, N.W.,' and 22 in 'Scotland, E.'"

MARKETS.

COVENT GARDEN, AUGUST 20.

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the dam ind; and they may fluctuate, not only from day to day, but often several times in one day. Ed. 1

DUBLIN: August 18.—Wholesale: -Tomatos, 3d. to 6d. per DUBLIN: August 18.—Wholesale:—Tomatos, 3d. to 6d. per b; Cucumbers, 1s. 6d. to 3s. 6d. per dozen; Marrows, 1s. 2d. to 2s. do; Calbage (York), 10s. to 17s. 3d. per load; Cauliflowers, 3s. 3d. to 4s. 3d. per flasket; Carrots, 8d. to 1s. per dozen bunches; Peas, 6s. 6d. to 7s. 6d. per bag; Celery, 1s. to 1s. 3d. per bunches; Peas, 6s. 6d. to 7s. 6d. per bag; Celery, 1s. to 1s. 3d. per bundle. Potatos; Kemp's, 3s. per ewt.; Hebrons, 2s. 6d. to 2s. 8d. do.; Punton's, 2s. 4d. to 2s. 6d. do. Beleast: August 18. There is an abundant supply of

Apples at low prices. Agricultural produce is in good supply, at fully average prices

SEEDS.

LONDON: August 19.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., report to-day's market thinly attended. There is an active consumptive demand from the country for Trifolium, at Monday's rates. English seed appears nearly exhausted, whilst the supply of French is in moderate compass. White Mustard meets an active sale at advancing prices. New home-grown winter Vetches come forward slowly. There is a fair quantity offering of fine new Essex Giant Seed Rive at low figures. Some everyhold new Spanish Seed Rye, at low figures. Some extra bold new Spanish capary seed has just arrived here. Hempseed is dull. Buckwheat firm. Peas steady

HAY.

Arcraps.—The following are the averages of the prices at the metropolitan markets during the past week:—Clover, prime, 70s. to 92s.; do., inferior, 38s. to 70s.; Hay, best, 60s. to 90s.; do., inferior, 36s. to 60s.; Mixture, 60s. to 85s.; and Straw, 20s. to 38s. per load

Are Carnations Herbaceous? A. Z. Certainly not. Herbaceous plants produce stems above ground, which last for one year only, and form others the the plant's vitality during the winter. Carnations could be shown in a class for hardy flowers, but in one for herbaceous flowers they were properly disqualified.

CARNATION ROOTS: J. F. S. The Carnation roots are attacked by an underground aphis ("green fly"),

which cannot be otherwise than injurious. Watering the plants at short intervals with one or other of the approved insecticides would probably destroy the insect. R. MrL.

Coco de Mer (Lodoicea sechellarum): T. C. There are several fine young plants of the double Cocoa-nutto be seen at the Royal Gardens, Kew. We suspect that your Nuts, just commencing to germinate, would be very acceptable at some of the other Botanic Gardens, especially on the Continent; but in private establishments, or even in nurseries, there would probably be no demand for them.

CORRECTION: On p. 171, under "Awards," for Erica Fascination read Eriocnema fascinator.

CUCUMBER DISEASE E. P. D.—The Cucumber shoots are in a had condition, but there is no fungus present, and we are unable, from the shoots themselves, to determine the cause. The mature The mature leaves present effused spots, upon which are developed a white mould, technically a Fusi-porium, but conforming to no known species. The curved, fusiform condia are profuse, and very variable in size, some of them about 20, and others about 50, micro-millemètres long, uniseptate, tris-p-tate, or quinqueseptate, acute at the extremities. We are not prepared to affirm that this mould is the cause of the diseased shoots; indeed we think it is not, but at any rate it appears to be parasite rather than saprophytic. We fear that the weak and unhealthy condition of the plants is due to some of the external surroundings. There is no trace of Bacteriosis. M. C. C.

DOUBLE-FLOWERED LOBELIAS: flowers of both varieties are double, but, unfortunately, their condition upon arriving was such that no estimate of their value could be formed.

GARDENERS' ORPHAN FUND .-- We have received, with many thanks, the sum of 2s. 6d. from Mr. J. Cobban. The amount has been sent to the

Grapes Diseased: Constant Reader. The berries are affected with "Spot" (Glassporium lacticulor). Remove all such berries as soon as they are observed. It is too late to treat them with any spray this season.

NAMES OF FRUITS: D. G. H. Apricots: 1, Large Early; 2, Kaisha.—C. B. 2, Kerry Pippin: 3, https://doi.org/10.1006/j.ppin.—J. F. S. Striped Juneating; 4, Sugarloaf Pippin, - J. F. S. Apple Golden Noble. — Imateur. Fig De l'Archipel. — East Lothian Gurdener. 1, Louise Emme of Jersey; 2, Benrré Hardy; 3, Doyenné Boussoch. 5, Bishop's Thumb, 6, Williams' Bon Chrétien. It is too early to name these Pears with certainty; specimens to be named should be nearly ripe.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number, — C. Bailey. Torenia Fournieri alba "White Wings."—II. R. 1, Malope tritida: 2, Echinops Ritro: 3, Sedum carnoum variegatum: 4, a grass not determinable; 5, Panicum variegatum; 6, apparently a Podocarpus; 7, Juniperus excelsa.—W. Graham. The plant you call Festnea arundinacea, is probably F, elatior, and the vernacular name for that species is Meadow Fescue. The Festucas generally are called Fescue grasses.— II. L. Santolina incana.—J. C. 1, Chimonanthus fragrans so far as we can tell, without the flowers; 2, Colutea arborescens.—C. ti. 1, Pisum sativum; 2, Mercurialis perennis; 3, Acer arietmum. - E. L. B. Salpiglossis sinuata, allied to Petunia.

ORCHID HOUSES: Amateur. You cannot do better than make the benches of slate, and upon this place a layer of shingle, small coal, or other moisture-retaining material. An open wood-work staging, about 5 or 6 inches high, should be made to rest upon the close one, and upon this the plants may be arranged. It is quite unnecessary to have the path. way made of concrete or fancy varieties of tilings, there being nothing better than a substantial wooden trellis or iron grating, either of which should be trens or non grading, entire of which should be laid flat upon the bare ground. When creeting a bench or stage, it is essential to have it sufficiently high to bring the plants to within a foot or 18 inches from the roof-glass.

PELARGONIUMS THAT NEVER FLOWER: W. L. There are varieties of Pelargoniums with extremely variegated foliage that seldom, if ever, flower. A nurseryman who grows this class of plants largely would probably furnish you wit's the names of several such varieties.

PRESERVING TEAS G. P. Peas mor be preserved by heating them in air-tight bottles as are

supplied by the French Flint Glass Bottle Co. These were figured and described at p. 565 in Gardeners' Chroniele for May 2. Peas may also be preserved in brine.

POLYFODIUM AUREUM SPORES Nemo. The growth of moss among the seedlings is probably due to the non-sterilisation of the soil on which the spores were sown. Sterilisation is effected by boiling water or by baking, or if this has been done, the moss may be due to subsequent overhead watering. Scald the soil well before sowing, always keep the surface covered by glass until the Ferns are developed, and only water by percolation from below. This done, moss should not appear.

SEEDSMAN SITUATION IN SOUTH AFRICA. Gordon. You might advertise in South Africa, a paper published in London, or write to Mr. Chas. Avres, nurseryman, at Cape Town. There are large seeds men at Grabamstown, at Pietermaritzburg, Port Elizabeth, including Mesers Smith Bros., and at Queenstown, Mesers, Edkins Bros.

ALTHEA FRUTEX; ITS PROPAGATION: C. B. Althea ETHEA FRUTEX; ITS PROPAGATION: C. B. Althea frutex, as it is still called in nurseries, more correctly, Hibiscus syriacus, is a native of Asia Minor. The usual method of propagation is by layering and grafting. For the last process the stock should be the single purple form, which is raised from seed, but it can also be root grafted. Taking one of the fleshy roots, split it with a sharp knife, then cut the base of the scion into a wedge those introduces it into the select root and list. shape, introduce it into the cleft root, and bind with raffia, then pot or bed out in the open, covering the soil well over the union. If the stocks are quartered out in the nursery, they may be grafted in the open in March. Open out the soil so as to make the union below the surface, and when finished, heap the soil into a ridge around the plants, covering the union, which may be waxed or smeared with clay. Cuttings may also be struck under a bell glass, but they are very slow.

TOMATO A FRUIT OR VEGETABLE J,M. See answer given to "W. M." in this column in our last issue.

Tomatos: A. L. J. The fruit sent was healthy enough, and had no trace of disease internally or externally. Perhaps a wrong one was sent.

TREE FERN: C. L. P., Maderra—It is not possible to name the Fern without its fruit.—You are probably right.

WARTY GROWTH IN POTATOS: F. M. B. Some curious examples of young malformed Potato tubers, in which the latter are tuberculated, somewhat after the manner of the tuber less on Alder roots, formerly known as Schinzia ahni. It was suggested that they might have been caused by insects, but of this there is no evidence. Externally they suggest Plasmo liophora, as seen on Cabbage roots, but as yet we have found no sign of Plasmodium. There are an immense number of brown spherical bodies, resembling Pythium, but as yet their true nature and relationship to the disease has not been traced. This is certainly a very peculiar form of Potato disease, which requires further investigation before it can be accurately determined. It is certain that the plants atticked are beyond recovery. Some of this material has been submitted to Mr. Worthington Smith, and he has expressed the opinion that the globose brown bodies are the same as those which he described as the restingspores of the Potato disease, but of the maximum They were all found near the surface of the tubercles, and it is questionable whether they are an efficient cause to account for the distortion and convolutions of the young tubers. We are both agreed that this manifestation of disease is a novelty. M. C. C. [We are, however, familiar with the external appearance presented. Ed.]

THE PRIZE MANURE

USED ALL OVER THE WORLD.

SPECIAL OFFER FOR THE SEASON .- To induce Gardeners to test and prove the value of this remarkable Manure, we will deliver :-

To any Station in the United Kingdom, 1 cwt. of Le Fruitier for 20s., in sealed bags.

GIVEN With each order one bag

Celebrated Fertilising Moss The successful medium for Plant Culture.

Such Unsolicited Letters as the following are continually reaching us:

The Gardens, Politimer Park, Exeter, July 25, 1896.

Dear Sirs,—Yours to hand. Your Continent il Wood-Wool is the fine-t packing material that I am acquainted with: seft as sitk. Being asked by a Fruiterer what it was, I had a pleasure in recommending it.

And now just another word for your Le Fruitier. It is some eight years ince I commenced using it for fruit trees, and still I have the same high opinion of it as I had the first year I tried it. I am gathering reaches from a tree which is carrying 13½ dozen fruits, which for colour are perfection; while my noble employer tells me the flavour is all that can be wished for; this tree, with the others in the same house, has been fed with Le Fruitier. As a manue for fruit trees it has no equal. It promotes the growth of wood suitable for giving fruit, and also produces leaves of a leathery texture: two very essential things in fruit growing. Applied to Vices, it produces Grapes.—Yours truly, T. H. SLADE, Head Gardener to the Right Hon. Lord Poltimore.

General Horsley will feel obliged if Messrs. Wood & Son will send him the same quantity of Le Fruitier as

General Horsley will feel obliged if Messrs. Wood & Son will send him the same quantity of Le Fruitier as first ordered. He never met with such a splendid manure for everything.—Horsley Manor, near Nailsworth, June 17, 1896

Llangedwyn Gardens. Oswestry, Salop, July 1, 1893.—Kindly send me 6 cwt, of Le Fruitier as early as possible. I should like to say how well my finit trees inside are doing since I have used Le Fruitier. The Peaches, Nectarines, Melons, and especially Muscats, are admired by every one who sees them.—Signed, G. J. SQUIBBS, Head Gardener to the Right Hon, the Dowager Lady William Wynn.

BONES. Meal, 4-Inch to 1-Inch for | FISH CUANO. SPLENDID VINE BORDERS.

SHIPMENTS.

SEND FOR ILLUSTRATED CATALOGUE.

NOW IS THE TIME TO USE SPECIAL LAWN MANURE.

The unsatisfectory state of the Grass, in consequence of the continued and phenomenal drought of the past season, has had our consideration, and we have prepared a Special Grass Compost (Lawa Menure), the value of which has already been extensively proved by its beneficial effects.

The early Autuma is the best time for its administration, as the Grasses are etimulated before the frost sets in.

Price, £3 10s. per ton. F. O. R.

ANNOUNCEMENT OF A NEW & IMPORTANT SERIAL WORK.

FAVOURITE FLOWERS

CARDEN AND GREENHOUSE.

By EDWARD STEP, F.L.S.

THE CULTURAL DIRECTIONS

Edited by WILLIAM WATSON, F.R H.S., Assistant Curator, Royal Gardens, Kew.

In medium 8vo, with about 700 pages of Descriptive Letterpress, Index Matter, &c., and 316 Full-Page Plates beautifully printed in Colours.

Nc. 1 Ready; No. 2, September 1; and subsequent Tuesdays till complete.

Reduced Cover of Weekly Issue.

Much has been done during the present generation to furnish the professional gardener with helpful manuals and dictionaries dealing with the cultural and technical side of his art, but too little attention has been bestowed upon garden-lovers, who would like to know something more of their flowers than the mere knowledge necessary for their successful growth.

The constant inquiry that the Publishers have had for a work on Cultivated Flowers that would meet the requirements of this large class has led them to undertake this publication.

FAVOURITE FLOWERS of GARDEN and GREEN-HOUSE has been in course of preparation for more than three years, and the Publishers have spared no expense to make it deserve an equal share of public favour with their now well-known

Royal Natural History.

The TEXT has primarily been written for the garden lover and amateur, although the professional gardener will also find much that will be of use and interest about flowers. The names of the Editors will be sufficient guarantee that the work will be scientifically accurate, although distinctly popular in treatment; practically, it is scarcely possible for any book to give detailed information of the thousands of varieties of flowers being constantly introduced, but examples of all the great leading groups of flowers will be included, and a brief list given of the principal varieties reproduced from these, with their distinct CHARACTERISTICS,

COLORATION, HARDINESS, SIZE OF BLOOM, FLOWERING TIME, HABITS, &c. With the principal genera the life-history is given, as well as terse, clear instructions for propagation and successful management.

The 316 COLOURED PLATES represent one or more types of these leading groups, and every care has been taken to present accurate pictures, even in apparently trifling details, of the flowers illustrated: in many instances—The Seed—Seedling—Hoot—Leaf—Blossom and Section of FLOWER, showing SEED DEPOSITORY, &c., are given.

These Plates have been designed and coloured, in all cases, from the living plants.

MODE OF PUBLICATION.

The Work will be completed in One Year from the date of the First Weekly Issue, in the following Styles:-

- lst. In Fifty-two Weekly Numbers-Published every Tuesday-(each containing Six Coloured Plates), One Shilling net per Number, or post-free, 1s. 1d.
- 2nd. In Four Volumes, handsomely bound in green cloth, gilt top (each containing Seventy-nine Coloured Plates), Fifteen Shilling a net per Volume, or post-free, 152. 6d.
- 3:d. In Four Volumes, elegantly bound in half-morocco, gilt top (each containing Seventy-nine Coloured Plates, Eighteen Shillings net per Volume, or post-free, 18s. 6d.

CASES for Binding every Thirteen Numbers, as completed, into the Quarterly Volumes, will be supplied in two styles, viz :

In cloth gilt 1s. 6d. net per Case. Pestage, 3d Extra.

In half-morocco . . . 3s. net per Case.

Note —The Four Volumes, either in cloth or half-morocco, will be published respectively on the day of issue of Nos. 13, 26 59, and 52, and with the weekly issue of these numbers a Gratis Supplement will be presented, containing all Title-Sheets, Index M.tter, and a Coloured Frontispiece for each Volume.

Subscribers will do well to place their Order for the entire Work, in the form they may select, at an early date, as the Edition, produced at great expense, is necessarily limited, and a reprint will take more than a year to complete. Prospectus Free.

..... For Four Yolumes, cloth gilt, gilt top, £3, Net. style required. For Four Volumes, half-morocco, £3 12s., Net.

Subscriptions are received at all Booksellers, News Agents, and Railway Bookstalls, OR BY THE PUBLISHERS-

FREDERICK WARNE & CO., 15, Bedford Street, Strand, London.

THE

Gardeners' Chronicle.

SATURDAY, AUGUST 29, 1896.

FLOWERS AND INSECTS.

THE question of the relation of insects to flowers is such an old one, and so much has been written on this subject, that one might very well think that nothing more could be just now said on this subject except in the way of repetition. There have, however, lately been published one or two papers, which deserve some notice in the pages of the Gardeners' Chronicle, in that they deal with an old subject in a somewhat new light. The first of these is entitled "Notes on the Study of the Crossfertilisation of Flowers by Insects," a paper which appears in the Proceedings of the Academy of Natural Sciences of Philadelphia for 1895, part 3 (published in 1896). The author, Miss lda A. Keller, here boldly asks whether Darwin, Hildebrand, Muller, Kerner and others were right when they said that cross-fertilisation was of utmost value to the individual species. She detects a bias towards the theory of cross-fertilisation in most writers on the subject, and admits that the prevailing impression seems to be that close-fertilisation is, as a rnle, only resorted to when all the chances for cross-fertilisation are at an end,

Miss Keller asks, "Are insects any material aid to plants in fertilisation?" and quotes Prof. Mechan's conclusions, that the great bulk of coloured flowering plants are self-fertilised; that only to a limited extent do insects aid fertilisation; that self-fertilisers are every way as healthy and vigorous, and immensely more productive than those dependent on insect aid; and, finally, that where plants are so dependent they are the worse fitted to engage in the struggle for life, the great underlying principle in natural selection.

Miss Keller proceeds to consider the chief adaptations which point towards cross-fertilisationdistinct sexes, specially adapted or conspicuous corolla, paculiar position of stamens and pistils, and difference in the time of maturity of stamens and pistils. With regard to the second of these adaptations, Miss Keller says she should not be surprised if, sooner or later, upon close examination, it would be found that in many cases where this adaptation to insects seems so perfect, the insect visitors aid in securing self-fertilisatifin. She regards insects, in very many cases, simply as robbers, and states that she has lately observed a very large patch of Gerardia pedicularia, the flowers being almost all pierced at the base of the corolla by bees perching on the outside and never touching stamens and pistils. Even as regards the peculiar position of the stamens and pistils Miss Keller says that whenever a plant bears many, or clusters of flowers, the chances of cross-fertilisation are reduced, and she pleads for careful observations which should decide the question how far in such cases, where there is a peculiar arrangement in the position of stamens and pistils in regard to each other, close-fertilisation is possible. With regard to the fact that in some flowers the time of maturity of stamens and pistils differs, Miss Keller quotes Mr. Meehan, who has put forward a theory that the difference between the time of maturity of stamen and pistil is caused by varying degrees of temperature, and that dichogamy has its origin in this circumstance, "that whatever its significance, it arises from no effort innate to the plant itself, but from an outside ferce that can have but little interest in crossfertilisation." Miss Keller suggests that it should be decided if cross-fertilisation, or autogamy, is the rule with every species which seems constructed so as to attract insects, and that this work should be done in as many different localities and at different times of the year as possible. At the close of her article Miss Keller makes four suggestions. She writes:--

"First, it is evident that the study of the phenomenon of cross-fertilisation of flowers by means of insects is still a profitable field for observation and discovery.

"Second, the effect of external conditions in reference to dichogamy should be the subject of critical experiment.

"Third, teleological explanations should be avoided as much as possible, here as elsewhere, according to the spirit of modern investigation.

Finally. The relative number of cases of cross and close-fertilisation should be compared, and it should be determined if cross-fertilisation actually takes place in all cases where this is assumed.

Miss Keller's article is interesting, in that it shows the tendency of biologists of the present day not to ascribe everything to natural selection, nor to explain the presence of certain protective features in plant and animal life by saying, as the Darwinians are wont to do, that these are directly caused by animals or plants. Miss Keller is doubtless right when she protests against those writers who would attribute certain adaptations which seem to point towards cross-fertilisation in plants to the direct agency of insects. Selection may accelerate or retard the progress of the selected along its definite grooves of natural change, but it cannot be held responsible for those constitutional peculiarities which arise in plants and animals and increase in them apart from any external agencies.

But the question of cross or close-fertilisation is by no means settled yet, and the conclusions of Darwin and Sprengel cannot be laid aside all at once, and we shall need a host of experiments before we can say definitely that cross-fertilisation is the exception and not the rule.

M. Felix Plateau recently made a communication to the Royal Academy of Belgium on the subject, "llow Flowers Attract Insects," and gave an account of some of his experiments on this thorny question. He is of opinion that the form of flowers or of inflorescences plays no part, or only a very unimportant one, in the attraction of insects by plants; that there is no proof that insects distinguish colonrs as the human eye distinguishes them; that the sense of smell is frequently very much developed among animals; that many allow themselves to be guided almost exclusively by this sense in their search for nourishment, &c.; and that they can perceive odours which do not affect the human olfactory organ.

He also reaches the following conclusions. Insects visit actively the inflorescences which have not undergone any mutilation, but whose form and colours are hidden by means of green leaves. Neither the form, nor the gay colours of flowers; seems to have any attractive action. Insects, in fact, according to Professor Plateau, are not attracted by form or colour as they appeal to our eyes, but by some other sense than that of sight.

It will certainly be somewhat of a shock to some conservative people to hear that the cherished convictions have been ruthlessly undermined. It seems we must give up believing that Nature loves cross-fertilisation, and adapts herself to it, and that the lovely hues of flowers are due to insects. The evolutionist must set to work and get some new theories to suit these fin de siècle opinions. How can we account for the beautiful colours and beautiful scents which please our senses, but apparently do not please insects at all? We must have more experiments before the question of the relations between flowers and insects can be satisfactorily settled. Herbert C. Fyfe.

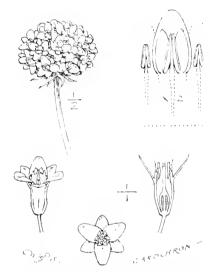

Fig. 44. -Erobley capitals var. Acra. Inflorescence half-size; flowers white, real size; stamens magnified.

NEW OR NOTEWORTHY PLANTS.

DELPHINIUM ZALIL.*

Ar one of the late meetings of the Royal Horticultural Society, cut spikes of this remarkable Larkspur were shown by Barr & Sen. Most of the spikes were not so densely flowered as the one drawn on p.247, in fact, a loose disposition of the flowers is one of the specific characters. The flowers are of a yellow colour. It was described by Messrs. Aitchison &

Delphinium (§ Delphinastrum) Zald, Aitch. et Hemsl., n. sp. in Aitchison, "Bot my of the Afgban Delimitation Commission," Lom. Trans., vol. iii., 1888, p. 30, t. 3. Herba perennis, creeta, I. 2 potalis, primum leviter puberula cito glabrescens; caulabus samplicibus vel pau i ramosis pallelis subnitidus striatulis. Folia gracilia, inferiora longe petiolata, petiolis superiorum gradatim breviorobus, omnia ternatipartita, saepius traternatipartita vel divisione intermedia introlum pimatipartita, 3-4 poll. diametro, segmentis linearibus rigolis. Flores lute, extus glabri, laviuscule, rucemosi, circiter 1 poll. diametro, pedicellisantice pubescentibus; calcar apice attennatum, sepalis acquaus; sepala lata; pet da an justa, bifida, intus leviter pilosa vel barbata; filamenta dilatata, superne leviter pilosula; gymecium glabrum. Folliculi 3, oblongi, glabri, longitudinaliter 5-costati, intercestata distanter reticulaci; semina oblonga, subquadrata, transversim eleganter finbriato-lumellata.

Allied to D. ochroleneum, Stev., but differing in its more finely-cut leaves, much looser raceines, glabrous flowers, pedicels densely pubescent below, and short, strongly ribbed follicles. Dr. Regel, to whom we submitted two or three flowers and a leaf, thought it might be D. ochroleneum Khorasan, 671, June 17, 1885; July 4, 1885.

Hemsley in their paper on "The Botany of the Afghan Delimitation Committee," and Dr. Aitchison gives the following account of it:—"Native name, Zalil. This plant forms a great portion of the herbage of the rolling downs of the Badghis; in the vicinity of Gulran it was in great abundance, and when in blossom gave a wondrous golden hue to the pastures; in many localities in Khorasan, above 3,000 feet altitude, it is equally common. The flowers are collected largely for exportation, chiefly to Persia, for dyeing silk; they are also exported from Herat through Afghanistan to Northern India, to be employed as a dye, as well as to be used in medicine."

ORCHID NOTES AND GLEANINGS.

L.ELIO-CATTLEYA × ELEGANS VARIETIES.

THERE is something so striking in the rich resetinted, fragrant flowers of the many varieties of this charming Orchid (which seems destined never to become plentiful) that when a plant flowers for the first time its possessor is anxious to obtain an opinion upon it, and consequently every summer we have a good opportunity of comparing them. Two speciallyremarkable flowers we have received recently; the first, which might be called L.-C. × elegans gigantea, comes from Joseph Broome, Esq., Sunny Hill, Llandudno, and it is hy far the largest we have seen. Across the expanded petals it measures 8 inches. The expanded side-lobes of the lip are $2\frac{1}{2}$ inches, and the showy front-lobe 2 inches. The sepals and petals are light rose-purple; the side-lobes of the lipereamwhite, tipped with light purple. From the base of the lip runs a broad red-purple band, which becomes suffused with violet as it merges into the bright magenta-purple front-lobe, which bears a raised venation of a darker hue. The column is purple above, and yellow and purple beneath-a very showy and remarkable flower.

The second is sent by M. Chas. Maron, Orchidgrower to M. Fournier, of Marseilles. In this the flower is only of average size, but the rose-purple colouring has a dark velvety-maroon shade, especially in the lip, which renders it very distinct from ordinary forms. The side-lobes of the lip are pale sulphur-yellow, and the column white above and rose beneath. The columns of these two distinct forms are very dissimilar, that of M. Fournier being stalked at the base, and with membraneous wings, while Mr. Broome's is much stouter throughout. J. O.B.

THE GENUS BRODLEA AND ITS ALLIES.

(Continued from p. 214).

SERIES II. — Stamens six, all bearing perfect anthers.

In the present paper I propose to deal with the groups in which all the six anthers are complete and uniform, and in which there are no stuminodia, though in some of the species the anthers or filaments are winged. These include the genera Triteleia, Calliprora and Hesperoscordum of Lindley, all three of which were merged in Triteleia by Dr. Greene, and included in Milla by myself in 1870.

Group 3.—Flowers many in a dense umbel. Perianth-tube oblong, about as long as the segments.

12. B. pulchella, Greene (Hookera pulchella, Salish. Parad, t. 117).—Agrees absolutely with B. conquista in habit and flowers, and has been commonly confounded with that species.

13. **B.** capitata, Benth. (Milla vapitata, Baker. Dichelostemma vapitatum, Wood).—Leaves narrowly linear, evanescent. Peduncle fragile, 1 to 2 feet long. Flowers many in a capitate umbel, bright lilac, ½ to $\frac{3}{4}$ inch long, with an oblong tube and oblong segments as long as the tube. Anthers sessile at the throat of the perianth-tube, the three of inner row with an oblong wing on each side. Ovary sessile.

Central California to Utah and New Mexico; abundant on the hill-sides in the neighbourhood of San Francisco, flowering in March. It is well formed in Park March 45912

figured in Bot. Mag., t. 5912.

Var. pauciflora, Terrey, from Sonora and New Mexico, differs from the type by its fewer flowers and longer pedicels. A white variety was exhibited recently by Messrs. Wallace & Co. (see fig. 44).

14. B. insularis, Greene, from the islands of the Californian coast, differs from the last in its more robust habit, rather larger flowers, and elongated central pedicels of the nmbel.

15. B. Douglasii, S. Wats. (Triteleia grandiflora, Lindl. and Greene. Milla grandiflora, Baker) -Leaves linear. Peduncle 11/2 to 2 feet long. Flowers six to twenty in a dense umbel, shortly stalked, light blue, an inch long, with oblong segments as long as the oblong tubes. Anthers biseriate, three sessile at the throat of the tube, three reaching nearly halfway up the segments, with a short winged filament. Ovary distinctly stalked.

British Columbia, eastward to Missouri. Well

figured in Bot. Mag., t. 6907.

16. B. Howelli, S. Wats. (Triteleia Howellii, Greene). - Very near the last, but flowers smaller, nearly white in the living specimens I have seen, with ovate perianth-segments not more than half as long as

Very common in the central parts of California. Considered by Prof. Greene to be the most showy and beautiful species of the whole genns.

19. B. candida (Tritelein candida, Greene).-Nearly allied to the last, but flowers only 6 to 10 in an umbel, white, with six green veins in the keel of the segments, and slender free filaments one-fifth of an inch long, "coiled almost or quite into a ring."

Foothills of the Californian Sierra Nevada; discovered by Mr. J. R. Sarphan in 1886. Not seen by me either in a living or dried state.

20. B. peduncularis, S. Wats. (Tritelcia peduncularis, Lindl. Milla poduncularis, Baker). Nearly allied to B. la.co, but flowers smaller, rose-purple, 3 to 1 inch long, and pedicels longer, sometimes reaching 6 to 10 inches, anthers nearly linear, not ovate-lanceolate.

California, from San Francisco northward, flowering later than its allies (fig. 47).

21. B. Bridgesii, S. Wats. (Triteleia Bridgesii, Greene).-Very near B. laxa, but the perianth-tube lengthened into a sub-cylindrical base, and longer filaments, as long as the linear anthers.

Fig. 45.—Brodilea Howelli Lilacina.

the tube, a less distinctly stalked ovary, and biseriate stamens with deltoid filaments.

Oregon and Washington territory. Figured in Bot. Mag., t. 6989, from specimens flowered in the southwest of Ireland by Mr. W. E. Gumbleton. A very fine variety of this, under the name B. Howelli lilacina, was lately figured and described from plants exhibited by Messrs. Wallace & Co. (see fig. 45.

17. B. Palmeri, S. Wats. (Contr. XVI., 78).-Leaves firm, linear. Flowers many in an unabel, bright lilac, shortly stalked, 5 inch long, with oldeng segments as long as the obconic tube.

California, at Los Angelos Bay, gathered by Dr. Palmer in 1888. Figured in Garden and Forest, 1889, p. 245, fig. 107.

Group 4. Umbels lax; pedicels articulated at the apex. Perianth-tube about as long as the segments. Ovary distinctly stalked. All North American.

18. B. laxa, S. Wats. (Tritelein laxa, Lindl., Bot. Reg., t. 1685. Milla laxa, Baker). Leaves narrowly linear; scape 1 to 2 feet long; flowers, 10 to 30 in an umbel, light or dark violet, 15 inch long, with segments shorter than the funnel-shape tube; pedicels 1 to 3 mehes long; stamens biseriate in the upper half of the perianth tube, anthers longer than the filaments, ovary distinctly stalked.

Central California, first received at Kew in the form of dried specimens in 1878. Fine specimens have lately been distributed from the Sequoia region by Mr. G. Hansen. Figured in Garden and Forest, 1888, p. 126.

22. B. Hendersoni, S. Wats, (Contrib., XV., 266). -Allied to the last, but perianth salmon-coloured, 1 to 1 inch long, segments ribbed with brown-purple, and pedicels not above one inch long.

Oregon; discovered by Mr. L. J. Henderson in 1884. Not figured.

23. B. Lemmonæ, S. Wats. (Tritdeia Lemmonæ, Greene).-Scape a foot long. Pedicels an inch long. Perianth deep orange, 4 to 5 lines long, with segments twice as long as the tube.

Mountains of Northern Acizona; discovered by Mr. and Mrs. Lemmon.

24. B. crocea, S. Wats. (Milla crocea, Baker, Sen. bertiet crocea, Wood. Triteleist crocea, Greene) .-Scape a foot or more long, flowers six to fifteen in an umbel: pedicels 1 to 2 inches long. Perianth yellow, 7 to 9 lines long, with segments longer than the tube. Anther distinctly biseriate, very small and oblong.

From mountains of the extreme north of California; first discovered by Professor Wood in 1868. Not figured.

25. B. gracilis, S. Wats, Tritslein gracilis, Greene), Peduncle under \(\frac{1}{2} \) foot long, with a single linear leaf halfway up. Flowers about a dozen in an umbel. with pedicels under an inch long. Periouth bright yellow, 1 inch long; segments oblong, keeled with brown, as long as the tube. Stumens reaching halfway up the segments.

Common in the pine woods of the Californian Sierra Nevada. Not figured. Rather resembles in habit our European Gagea lutea. J. G. Buker.

(To be continued .

KEW NOTES.

NEPLATRIES PERVILLEL -Plants of this interesting species of Nepenthes are now flourishing in the Kew collection, having been raised there from seeds received in 1894 from Mr. T. Risely Griffith, Administrator at the Seychelle Islands, where this species is endemic. The plants have shining-green oblanceolate leaves 4 inches long and 13 inch wide, and pitchers 2 inches long, yellowish-green, tinged with red when young, becoming dull crimson with age. According to a figure prepared by Fitch from specimens collected by Dr. Perceval Wright, and published in the Trans actions of the Royal Irish Academy in 1868, the leaves become I foot long by 41 inches wide, and the pitchers 8 inches by 24. So far as I know, this species has never before been grown in this country, although frequent attempts have been made to introduce it to Kew and elsewhere. Dr. Wright named it N. Wardii, in ignorance of its having been previously named by Blume as above. It differs from other Nepenthes in the narrowness of the bone-like rim surrounding the mouth of the pitcher, and in the unusual width of its leaves.

NEPENTHES VEITCHIL

A male plant of this somewhat rare Bornean Nepenthes is now in flower in a stove at Kew, and 1 am informed that a female of the same species is flowering in the nursery of Messrs, F. Sander & Co., St. Albans. There is nothing remarkable about the flowers of Nepenthes, beyond the fact that notwithstanding a considerable range of variation in the pitchers, leaves, and habit of the thirty or so species known, there is sourcely any difference in their flowers; the inflorescence of N. Veitchii, for instance, being practically identical with that of N. Curtisii, N. Rufflesiana, N. Rajah, &c. N. Veitchii was introduced from Borneo by Messrs. Veitch's collector, Thomas Lobb, and flowered at Chelsea in 1858, when a figure of it was published in the Botanical Magazine under the erroneous name of N. villosa. The true N. villosa is not in cultivation, but a figure of it may be found in the Linnean Society's Transmitions, vxii., t. 69.

SOBRALIA SESSILIS.

The true plant of this name was figured in the Botanical Mayazine two years ago from a specimen flowered at Kew, and which had been imported from British Guiana, by Sir John Kirk, G.C.M.G. It differs from the plant generally grown for S. sessilis, but which is really S. deepra, in having stems mottled with purple, leaves tinged with purple on the lower side, and handsomer, darker coloured flowers. A second plant, obtained from Messrs. F. Sander & Co., in 1892, as a purple-leaved Sobralia, is now flowering at Kew. It has stems 3 feet high, and flowers like those represented in the Botanier/ Mayarine, except that the sepals and petals have almost white margins, the flower suggesting a good var ety of Cattleya marginata. As Messis. Sander have, or had, a quantity of plants of this purple-leaved Sobralia, it ought now to be fairly compion. The Kew example has about a dozen stems from 2 to 3 feet high; it is grown in a tropical-house. In Demerara the stems grow to a length of 4 feet. It is a much better gorden Orchel than S. decora.

CYCNOCHIS.

This genus is represented at Kew just now by flowering examples of two of the most attractive, viz. C. chlorochilon and C. pentadactylon. The former is the largest of all, and the Kew plant has a spike with four enormous flowers springing from a pseudobulb a foot long; the flowers are nearly 6 inches

across, and they are coloured cream-yellow, with a large blotch of dark shining green at the base of the large labellum, which in appearance suggests a slab of Devonshire cheese. At Kew we find this species enjoys the excessive heat and moisture of the growinghouse for Den lrobiums. C. pentadactylon bears a curved spike of four flowers, which are male, and therefore far more attractive than the female flow rs of the same species, of which a plant flowered at Kew last year. The extraord nary form of the labellum, and graceful curve of the column in the mile flowers, with their brown-spotted reflexed sepals and petals, are attractive features in this species, which has been known to cultivators since 1541, but is still a very rare Orchid. Collectors might do worse than turn their attention to this genus and its allies, the Mormodes and Catasetums.

The following interesting plants may now be seen in flower in the houses at Kew:—Aristolochia gigas Sturtevantii, A. hians, Stapelia gigantea, Eucalyptus calophylla, Lazerstræmia indica. Marianthus ringens, Cereus peruvianus, C. triangularis exceptionally floriferous this year, Victoria regia, Passiflora alata, P. quandrangularis, P. edulis, P. maliformis, P. violacea, P. racemosa, P. Raddeana (kermesina, P. Watsoniana, Bougainvillea spectabilis, Arauja graveolens, Talauma pumila, Crinum yuccæflorum, C. podophyllum, and Gmelina hystrix.

TERMINALIA CATAPPA.

Seeds of this tropical tree were recently received at Kew from a correspondent, who called them the "Arabian Wild Almond from the northern shores of Arabia and the Persian Gulf." In size, form, and outward appearance, they so closely resembled the seeds of the Almond Prunus Amygdalus) that they were accepted as such, but on germinating they at once reye ded their true character. Terminalia Catappa is known as the Country Almon I, no doubt because of the similarity of its see is to the time Almond, which are also edible, and this no doubt accounts for the wide distribution of the plant which, according to Mr. C. B. Clarke, is wild or cultivated in nearly all tropical countries. It forms a tree up to 80 feet in height, with horizontal branches, large ovate, rusty-coloured leaves, which are deciduous in the cold season, and has erect axillary spikes of inconspicuous white flowers. The fruit is a dry oval drupe, compressed, and slightly winged, and containing one Almoud-like seed. The tree is said to delight in a sandy soil. In a note by Sir William Hooker under a figure of the plant published in the Batanical Majazine, and prepared from a plant that flowered in the Liverpool Botanie Garden, the fruit is said to be abundantly eaten, being served up at the first tables in India. Dr. Roxburgh compares the flavour of the kernel to that of fine Almonds or Filberts. An oil, too, is expressed from it, equal to the best Olive oil, and which does not become rancid. The wood is white, hard, and useful for a variety of purposes, and the tree itself. on account of its beauty and the shade it yields, is plinted round about the houses. Other names for this plant are T. Myrobalana, Catappa domestica, Juglans Citappa, &c. The genus is related to Combretum, and consists of about eighty species, all of them large trees, and distributed in the tropics of the whole world, W. W.

NURSERY NOTES.

A HOME FLOWER-SEED FARM.

Does our patriotism run away with our judgment when we decry continental productions, and praise our own produce to the skies, even if inferior? That seems to be so. If, on the other hand, we find produce raised at home to be not only as good, but in some respects better than can be had elsewhere then may our satisfaction be true patriotism, because we naturally like to produce the best. It was we naturally like to produce the best. It was with some such latter feeling I walked the other by over the Meser. H. Cannell & Sons' seed farm at Lynsford Kent. To that very enterprising firm, no health it is in ist natural the results should be a

pecuniary success. To me, having no such interest, the visit was most attractive, apart from the wondrous breadths of colour and of beauty found in every direction, because of the abundant evidence manifested of the capacity of the southern soil and climate of old England to produce seeds in great variety and of the best. Perhaps, because we have so long purchased seeds of continental growth, we have got to regard them somewhat fetishly, and for that reason have regarded with suspicion the seeds of home growth, or doubted our capacity to produce seeds as good. The land at Eynsford is much exposed, and consists of a fertile valley, with steep sides reaching to considerable height, and it is certain that it has the advantage of obtaining a maximum of sunshine and pure air; and should rains unduly prevail, there are the drying winds which sweep over the hill-sides and dissipate much of its over-abundance. There is also so large an area of land, diversified as it is in aspect and soil, that change in the nature of the respective seed crops can readily be furnished each year. Now there are numerous seeds constantly raised at home as to which there can be no question as to elimatic capacity. Peas, for instance, are here in great quantity, and in all the best varieties, and the seed, threshed and cleaned, is as sound and firm as it is possible for seeds to be. Onion seed, on the other hand, is not always so readily produced, yet the crops at Eynsford always seem to be of the hest. Perhaps one reason for that success is found in the effort which the Messrs. Cannell make to secure high class seed bulbs. 1 observed that many fine ones of the now ordinary exhibition size were being grown very thinly. expressly to produce seed next year. Gigantic soft bulbs are not the best, but solid, hard, ripe ones ranging from 20 to 24 ounces each, are all that can be desired to give very fine reproductive stocks. Just the same great pains are taken with all vegetables, as every -ecdsman in these days of severe competition knows that so exacting are customers, that only the very best strains will satisfy.

Now there are numerous hardy annuals which produce good seed at home with but little trouble to the cultivator; so also will the bulk of hardy biennials and perennials. It is but needful to look at the huge brealth of Snapdragons, in diverse colours. tall and dwarf, widely distributed; Pentstemons of the very finest, and so easily raised from seed also; Hollyhocks, of which there is a fine and varied double strain; Pausies, Violas, Delphiniums, Carnations, and myrials of other things, to be as assured that the seed raise I here is as good as the most favoured climes in the world can produce. But there are numerous things - tender annuals, for instance that come into a different category. One of the most remarkable features of the Eynsford Farm, just now, are the Asters. There were about 100,000 plants dibbled out in May or June, a great labour, and they cover some three acres of ground. They make indeed a glorious sight, such an one as no other place but a big seed-farm can produce. The huge masses of Victorius, Chrysanthemam-flowered, Mignons, Pæony-flowered, Comets, Needles, Miniatures, &c., and each section having perhaps a dozen or more of diverse hues and markings, make up indeed a wondrously beautiful d.splay. Growing Asters so largely gives great opportunities for making selections of new tints of colour.

Still further, the firm purchase seed of promising novelties from the continent for the purpose of testing them in Kent, but not always with satisfactory results. Still, if but a few prove to be acquisitions it is a gain. Rather incredulous as to the result of growing home-saved seed of Aster from year to year of the flat petalled forms, for none can excel us in our strains of quilled Asters, I enquired whether the stocks seen at Eynsford were the product of last year's home-raised seed, and was assured that such was the case. Mr. Robert Cannell sull that several of the stocks were from homegrown seed for three seasons, and he declared that they found distinct advance in quality each year. In any case the stocks are so good that none anywhere you'd excel them. The new Yellow-quilled Aster is

found in great bulk, and that, too, is flowering finely. All the biennial and some of the choicer of the Tenweek Stocks are grown in pots, and flowered under glass. That ensures the production of perfect seed. Phlox Drummondi, Petunias in great variety, especially the giant single or grandiflora forms; Verbenas, in mixture as well as in several distinct colours; Zinnias, African and French Marigolds, both tall and dwarf: Nasturtiums, Dianthus-indeed, so many diverse things of the tender section are grown that enumeration is impo sible here. After gazing so long upon these brilliant as well as big masses of floral beauty, I felt like Dean Hole when he turned to the Parsley-bell for an eye-rest, that there was welcome change when Mr. Cannell drew attention to his stock of Eynsford Beanty Parsley, so green, compact, and so good in every respect.

There is in the valley a big breadth of some fifty or sixty varieties of bedding Violas. They do well, and bloom profusely all the summer in spite of the drought. I got a promise that some plants presently should be sent to Chiswick. In the Eynsford glasshouses are great quantities of Tomatos grown for seed, also Cucumbers and Melons; and at Swanley there are houses filled with Balsams, Colens, Begonias, Gloxinias, and various other things all for the same purpose-verily, this seed-growing business is a wonderfully interesting one. It needs immenso patience, care, supervision, and knowledge. Few who purchase seeds, perhaps, stop to ask how produced. Those who do not know, and would wish to do so, cannot do better than spend a summer's day, as I recently did, visiting the seed-growing establish-

ment of Swanley and Eynsford. A. D.

TRINIDAD ORCHIDS.

If a visitor has the appliances at his command for maintaining a high temperature with plenty of moisture all the year round, he may take home from Trinidad and grow a considerable number of the native species in comparative safety and with no little success; but if he has only a greenhouse or the heat of a parlour, in which to place them, he had better leave them alone, and save his time, his money, and his trouble; for most assuredly they will not thrive under such conditions. I know there are persons who will give different advice to this, but I pity the visitor who relies upon it. A temperature of 75° to 78° Fah., with a minimum of 60, the Orchids of Trinidad must have, or they will suffer largely, and those who wish Orchids to grow in rooms, should select species coming from altitudes where the climate is more nearly akin to that of the temperate zone than is shown by the Trinidad register.

If, however, the visitor has appliances which will enable him to maintain proper conditions, there are several Trinidad Orchids well worthy of his notice, which can be obtained at reasonable rates, and it is proposed to note such, as each species or variety is passed in review.

The best time for packing and sending away (fixed after many years trial) is during the month of July; a week sooner or later being a matter of no importance. Orchids should be sent in dry eases at this season with ventilation, and in no instance should any kind of packing or stuffing be used, but simply struts or bars to prevent the plants pressing upon one another in the cases.

Oxcidian ampliatum, Lin II., appears to have been first described in Lindley's Orchiduccous Plants, published in 1839, and the habitat was given as Panama et Columbia occidentale. Reference is made to the same plant in the Botanical Register in 1835. Grisebach gives the habitat, Costa Rica to Venezuela, which includes Trinidad. The Orchid is known in Trinidad as the "Yellow Bee," and is one of our commonest kinds, some of the branches of native trees in the Garden being sufficiently covered to furnish us with basketfuls of bloom at a single cutting, and is in great demand in its season for table decoration. The variety, Oncidium ampliatum majus, grows to a much larger size than the type species, and it is said to be obtainable only from Costa Rica. There is, however, an indigenous variety which was termed

majus by my predecessor, which is so near the Costa Rican plant as to be hardly distinguished. The difference between the type and the variety is well marked to the cultivator; as the first has short peduncles (1 to 2 feet) and somewhat spreading panicles, while the majus variety is noted for its long (4 to 5 feet) peduncles and compact panicles. The lateral lobes of the lip in the type are spotted red, while in the variety majus they are clear and yellow like the lip. Oncidium ampliatum is always to be found in Trinidad in flower in the earlier months of the year, its favourite home being on the upper side of the branches of large spreading trees, which afford it partial shade. The plant is one suitable for cultivation in Europe and America.

Oncidium iridifolium, Kth.—This Oncidium is really a little beauty, but like many others is a hard one to maintain under cultivation, unless the exact condition it requires is supplied. In 1887 I had it first brought in by a native collector, and then for seven years I did not again see it—the pieces kept at the Gardens gradually dwindling away.

From the appearance, however, of the twigs on which it is brought, and from the accounts given by a collector, it appears to grow upon the outer branches of trees situated in damp districts, some of the plants being on twigs not more than a quarter of an inch in diameter. Last year we tried it, tied tightly to such branches as I have just described, and left it fully exposed, to take care of itself. It has done fairly well, and continued to produce its single flowers during the greater part of the year. Our garden, however, evidently is not damp enough, for the plants put on a shrivelled appearance. On the other hand, it is found to be extremely impatient to an excess of moisture. If some Orehid fanciers could see this little beauty, as now on the table before me, a single plant with twelve blooms regularly spread out in the shape of a fan, exactly 4½ inches in diameter, they would I feel sure not rest satisfied until they had placed it in their collection. The plant apparently grows freely from seed, as the twigs of the trees on which it grows are covered with plants of all sizes, from the mere speck to the mature form 4½ inches in diameter.

This Orchid must be placed with those difficult to cultivate, although it is a highly desirable one from its rarity and beauty. J. H. Hart, in "Bulletin of the Royal Botanic Garden, Trinidad."

REMARKS ON THE FRUIT CROPS.

(See Tables, pp. 124 to 131.) (Concluded from p. 212.) 8. ENGLAND, S.W.

HEREFORDSHIRE.—The Apple erop here is a very poor one, owing to the attack of the winter-moth, caterpillar, and the sharp frosts at the end of May. The earlier-blooming sorts of fruits have done better. Pears, Apricots, and Peaches being a good crop. Plums were destroyed after they were as large as Peas by a severe frost. John Watkins, Pomona Farm, Withington, Hereford.

— Apples are a complete failure, and the trees so badly blighted that we have very poor hopes for next year. Pears are very bright and clean, but the fruits will be small. All small fruits have been plentiful, but the season very short. Late Strawberries have been very good, and Morello Cherries also. Frank Harris, Eastnar Castle Gardens, Ledburg.

— The return I gave on the tabular form was for this garden alone, and does not refer to the orehards and cottage gardens in the neighbourhood, in the majority of which the crops are very light indeed. Vintage fruits of the Apple and Pear are more scarce than table fruits. This is to be regretted now that the cider and perry-making industry has come to the fore once again. The failure has arisen, I believe, from two causes, the chief of which was the unprecedented attack upon embryo fruit and foliage by caterpillars, and the dry state of the soil at the time the trees were in blossom, which prevented great numbers of the blooms from setting. In the gardens we have good crops of all kinds of fruit, but

much time and labour had to be expended in washing the trees with insecticide, and this has had to be followed up since then by frequent waterings on account of the drought. A. Ward, Stoke Elith Gurdens.

MONMOUTHSHIRE.—Fruit trees generally bloomed freely. The cold, dry N. and N.E. winds however that prevailed during the season of flowering were unfavourable to Apples, which are a small crop. The following varieties are good: Irish Peach, Duchess of Ollenburg, Lord Suffield, King of the Pippins, Worcester Pearmain, Ross Nonpareil, Cellini, Frogmore Prolific, Golden Noble, Grenadier, and The Queen. Pears are also partial, the best croppers being Benrré Diel, Beurré Fouqueray, l'itmaston Duchess, Durondeau, Baronne de Mello, Louise Bonne, and Williams' Bon Chretien. Plums are heavy in crop, as are bush fruits. particularly Raspberries and Gooseberries. The dry weather has not injured the quality of the fruit. Insect pests have been unusually troublesome, and in the case of Apples, mildew has been persistent, but

Fig. 4). Enoty Ev (Triteleia) Laxy.
Inflorescence half-size, flowers violet, real size,

(See p. 239.)

these pests have been kept under by frequent sprayings of Bordeaux Mixture, Quassia extract, and Paris Green. Thos. Coomber, The Hendre Gurdens.

— The orchards in which young trees predominate are clean and healthy, and have a fair crop of fruit, but others, where the trees are old, have been nearly denuded of foliage by caterpillars, and they are now infested with red-spider. More particularly is this noticeable on the uplands. Pears are good on espaliers and pyramids, such sorts as Jargonelle, Marie Louise, Madame Treyve, and Glou Morceau bearing heavy crops. Plums are an average crop. Peaches and Nectarines have done well. Agricots are good. It is interesting to notice how free we are from diseased branches this year in the variety Moorpark, W. F. Words, Llanfrechfa Grange Gardens, Caerleon.

SOMERSETSHIRE.—The fruit crops are anything but satisfactory. In the early spring, Peaches, Nectarines, Apricots, and Cherries on walls, were in a wretched condition, due to the cold nights, east winds and absence of rain. As soon as a little growth was made, it was blistered with galls, and many of the Peaches and Nectarines had to be entirely stripped of the little foliage they had. Only

a few trees carry anything like a crop, and these will be small. The crop of Plums is very heavy; many trees are breaking down; these also will be a naller in size than usual. Apples and Pears are very light crops generally. Strawber ries were early this year, and lasted but a very short time. Raspberries and Rad Currants have been very searce. H. Nobl. Ashton Court Gurdens, near Bristol.

Apples are very few. The trees bloomed freely, but the magget has injured the crop greatly, and the dry weather has causel many to fall. All kinds of Pears are very pleutiful, and Plams are a full crop. Peaches and Nectarines are very pleutiful: we gathered ripe fruits of the variety Waterloo on July 1. William Thomas, Norton Manor Gardons, Taunton.

Worcestershire.—The Apple crop is a light one, chiefly owing to weakness due to over-cropping last year, and partly to the depredations of the Appleblossom weevils and caterpillars. Pears are much better, being both clean and good. Apricots are abundant, and of the highest quality. Peaches and Necturines are splendid crops, and the trees healthy, although most persistently attacked again and again by hordes of aphides. We gathered Alexander fully ripe but rather small, from a south wall on June 29. Strawberries suffered sully from the intense heat and drought. Plums and Cherries have been budly infested with aphis. Bush fruits abundant, but somewhat prematurely ripened. Altogether a most precocion season with undesirable extremes. William Cramp, Madresfield Court, Great Malegon.

Though the Apple crop is on the whole under the average in this district, there are good but varying crops in those orchards where the soil is of a more retentive nature, the best crops being on the more tenacious loams. After the enormous crop of last year, the trees generally had a good deal to recuperate. This, with the comparatively dry winter and spring, was altogether against those trees on the lighter soils. Fredk. Hughes, The Gardens, Overburg, Towlesburg.

WALES.

Cardiganshire.—This has been a very trying season, owing to the long drought. Apples and Pears set well, but they have dropped badly since. Cherries on walls were a good crop, but we had to water the trees frequently. Bush fruits have been very good. Birds are more destructive to fruit than usual, owing to the scarcity of other food. R. C. Williams, Crosswood Park, Aberystwith.

DENBIGHERIE - Apples bloomed and set profusely, and the abnormally dry weather kindly thinned the crops. Still some varieties have very heavy crops; Pears having been over-cropped last year are under average, but some varieties are exceptions. Dessert varieties of Plums are but a thin crop, but kitchen varieties have fairly good ones. Damsons and Bullaces have good crops, but they are rusty. Peaches and Nectarines are moderate; they are infested with spider. Cherries are excellent-Morellos especially so. Raspberries have borne a heavy crop of good quality. Superlative being far the finest of eight sorts. Strawberries were an immense crop, and Noble a fine fruiter under all circumstances: Lucas very good, and Royal Sovereign a fine variety; John Ruskin was very early and good: Sir Joseph Paxton surpassed itself. Gooseberries are quite loaded, all varieties doing well. Black, red, and white Currants were very plentiful. and of fine quality, all foliage have kept clean and free as yet from mildew, but the American blight has obtained a slight hold. This pest was all but extirpited by the seventy-eight days of continuous frost last year. P. Muldleton, Wynnstay Gardens.

GLAMORGANSHIRE.—The fruit-crops in this district have suffered much from the drought. The rainfall in Jan. was '97 inch: Feb. '84; March 4.55; April '94; May '18; June 2'92; and July (up to the 16th) '57. The Apple trees in the gardens are bully infested with red-spider, and a great many of the fruits dropped after swelling to a good size. The trees in the orchard at Swaubridge Vineyard (seven miles from here), are clean and healthy, and bearing a good crop of large-size! fruits.

The leaves of some of the Pear-trees have been badly attacked with the slimy larvæ of the slugworm (Selandria pyrii), a kind of saw-fly, which have eaten the epidermis on both sides of the leaves, turned them quite brown, and spoiled the fruit. Some of the trees not attacked are bearing good crops. Strawberries have been very good, both in crop and quality, notwithstanding the dry season. The Vines in the vineyards at Castle Coch and Swanbridge are loaded with Grapes, which promise to be the best yield since they were planted. The fruit is fully a month earlier than usual. A. Pettigrew, Castle Gardens, Cardiff.

— Apples are under average; Cox's Orange Pippin, Hawthornden, Golden Pippin, Cellini, and Worcester Pearmain are the best. Pears also and Plums are under average. Washington, Green Gage, Pond's Seedling, and Victoria are carrying the best crops. Wm. McD. Bennett, The Gardens, Talyyarn.

PEMBROKESHIRE.—Apples are a good crop in colder and later orchards. On warm situations where the trees bloomed early the crops were much injured by a frost of 6½°, which occurred on May 1. The same frost had a rather singular effect on the Plum crop. All varieties had set a very heavy crop, but the frost quite destroyed all the white, red, yellow, and greenskinned, but did very little harm to the black-skinned varieties. Such was the case in the garden here; but as Plums (with the exception of Damsons), are not much grown in this district, I have not been able to ascertain if these effects are general or not. Geo. Griffin, Slebeck Park.

9. IRELAND, N.

Carlow.—Fruit crops of all kinds are good, but owing to the very long drought in the early part of the summer, some of the small fruits were not so good as they had promised to be. We had but little rain during the mouths of April, May, and part of June. Some of the early Strawberries ripened prematurely. Apples are a very heavy crop, but not more so than last year. Thos. Bloomer, Linarugh.

DUBLIN.—The frait crops in this neighbourhood have not fulfilled the expectations entertained in the early part of the season. Peaches are very few, Apricots are a good average, Plams and Cherries rather more than average, Apples are very good, but Pears poor. G. Smith, Vice-Reyal Garden.

Gatway.—A sharp frost (3°) on the morning of May 1 thinned the Apple crop considerably; still, the trees, with very few exceptions, are bearing a fine crop of nice clean fruits. Pears are good also, though a little thin. Cherries are an average crop and good. Some of the finer varieties of Plums are light, but taken as a whole, the crop is an average one. Small fruits of all kinds are abundant and fine. Strawberries suffered from frost on the above mentioned date, and they also felt the effects of the long-continued drought, although rain came in time to benefit the later half of the crop. John Cobban, Garbally, Bullinasloe.

LONGFORD.—Apples everywhere are an immense crop. Trees that for years have refused to bear have this year broken the ban they long lay under. Bush fruits were very good, but Strawberries not so good. J. Rafferty, Castle Forbes.

Wicklow.—Without exception the Apple crop in this district is excellent; also Raspberries. Strawberries on retentive soil were an average crop, but of short duration. Black Currants in most places were very scarce; Gooseherries and red Currants slightly better. Levi Childs, Killruddery, Eray.

10. IRELAND, S.

KILDARE.—Small fruits have been abundant, but owing to the prolonged drought, they were deficient in size. Strawberries turned out well; a timely rainfall having saved them. A few plants were so badly infested with green-fly when in bloom, that we were obliged to destroy them. The Apple crop is a very heavy one. J. Wyke, Bishop's Court, Straffan.

- The fruit crops in this district are over average, with the exception of Peaches and Apricots,

and these being in bloom during March, would not set, as there was only one fine day through the whole month. Apples are a wonderful crop, and I do not remember seeing them so large thus early in the season. Freelk. Bedford, Straffan House.

LIMERICK.—The present is not a good fruit season generally. In this district some kinds have been plentiful and good, but were soon over. Strawberries, for instance, eame in very early. Ou May 21 we gathered the first dish of Royal Sovereign, which, I might add, has replaced Noble here; James Veitch, Vicomtesse, President, and Latest of All were extra good, but all were over by the end of June. Raspberries were also of short duration. Pears are partial. Early kinds are abundant, but late kinds are scarce. Peaches, Nectarines, and Apricots are failures, owing to sharp frost, followed by east wind, when the trees were in bloom. J. Ellicott, Summerville Gardens, Limerick.

Waterford.—This season is the best I have ever seen so far as fruit crops in this locality are concerned. Thos. Dunne, Strawally Castle, Villierstown.

Apples are very plentiful, but owing to the dry season, they have dropped badly. Strawberries were good, but the season was of short duration. Pears are an excellent crop, and the trees are clean. The recent rains have done much good, and fruit is improving in size, especially Apples and Pears. Thos. Singleton, Curraghmore tiardens, Portlaw.

CHANNEL ISLANDS.

ISLE OF MAN.—The fruit crop here is fairly good in general. Apples are abundant and good. Pears on walls are few, but good on standards. All small fruits have been plentiful and good. Strawberries have been very good. The first were githered on May 25, and were plentiful, Cameronian Prince being my favourite variety. Jas. Inglis, The Nunnery timeless.

JERSEY.—Owing to prolonged drought the whole of the fruit crops suffered severely, Apples and Pears dropping freely. Early varieties in all cases are a better crop than late ones. Pears promise to be of excellent quality. H. Becker, nurserymen and fruit grower, Jersey.

FORESTRY.

NORTH AMERICAN CONIFERS IN GERMANY.

NEXT to the Douglas Fir, the Menzies' Spruce, Picea sitchensis or Abies Menziesii, has given very good results, the area planted being about 100 acres. Professor Sargent describes the wood of this tree as "light, soft, not dense, silky texture, used tor all kinds of woodwork, building, interior fittings of houses, &c. Mean specific weight, 4287."

Two American-grown specimens examined showed considerable variation in the breadth of the woodrings, and also in the formation of the summer-wood zones. The wood has the exact appearance of that of the common Spruce, and no external characteristics which would enable the two species to be distinguished. from each other are present. The specific weight was found to differ little from that of the Norway Spruce. This tree in America has a very local distribution, and it is probable that a moist climite is necessary for its success. This is borne out by the experience of planters in this country, for the further north the better do we find this tree succeed. The promising appearance of the species on a cold, dump soil at Methyen Castle, Perthshire, is noticed by Forbes in the Pinetum Woburnense in 1839, and I believe a specimen alluded to in that work is now one of the finest in Britain. Both Willkomm (Forst Flora), and Mayr (Die Waldungen von Nordamerika) put a low value on the timber of this tree, although it is apparently quite equal to our European Spruce, and on very wet ground, may produce more timber than that tree.

Cupressus (Channecyparis) Lawsoniana has been planted on about 20 acres, and succeeds very well on even poor Scots Pine soils. According to Sargent, this species is not indigenous further inland than 30 miles from the eoast, and like the preceding one, eajoys atmospheric moisture, wood said to be light, dense and hard, and easily worked. Very durable in the ground, with a silky texture, and taking on a good polish. Largely used by turners, and for building and railway sleepers, &c. Specific weight 4621.

German specimens of this tree examined were too young and immature to allow of any useful comparison between them and American-grown wood being made, but so far the wood appeared to closely resemble that of Silver Fir, but of better colour and texture, and more suitable for carving and turning. According to Mayr, this species attains its optimum development in Southern Oregon, where Figs and Eucalyptus are quite bardy, and it is only in sheltered and moist localities that the best results are likely to be attained in Germany or England. As a matter of fact, the Lawson Cypress is hardy enough to withstand our coldest winters [Several were injured to our knowledge last winter. Ep.]; but its rate of growth is too slow in this country to recommend it as a forest tree.

Thuia gigantea covers about 35 acres, and the results have in general been satisfactory; but careful choice of situations is recommended. As most suitable, fresh, damp, and deep soils of a sandy or peaty nature are mentioned. The wood is described as very light, soft, brittle, &c., easily worked, and durable in the ground—much used for the insidefittings of houses. Specific weight, 3795. Owing to its exceptional lightness, it is not considered suitable for purposes where strength is required, although its rate of growth in suitable situations renders it a favourite with modern planters. As with the others, so with this, a moist atmosphero appears to be necessary for its healthy growth.

Pinus rigida.—A considerable area has been planted with the so-called "Pitch Pine," P. rigida. The qualities possesse I by the timber appear to be of a low order, the wood being light, soft, brittle, and coarse-fibred—chiefly use I for firewood and charcoal. Compared with the Scots Pine, the timber is quite as heavy, probably due to its resinous nature, but too coarse for the finer kinds of work. Its chief value lies in its adaptability for thriving on poor, barren soils where little else will grow, and ou sach soils its timber is of better quality than that produced on good ground.

In briefly summing up the prospects of the trees named above in the afforesting work of the future. the Douglas Fir scens to struct out above the rest in adaptability to situations, rate of growth, and quality of timber, and the favour it receives ou all sides is justified by results hitherto obtained throughout northern Europe. For the remainder, their use ean only be considered advisable where special circumstunces render them more likely to succeed and furnish a better yield of timber than native species. The humid climates of Ireland and certain parts of Scotland and the north of England, together with the prevailing classes of soils in those parts, render them particularly suited to the requirements of these species, and the only question will be as to a sufficiently extensive use being found for the class of timber produced by such species and surroundings. This is the problem of economic forestry. A. C. Forbes.

DISTRIBUTION OF THE APPLE CROP.

ATTENTION has been called by Charles C. Bell, President of the National Apple Shippers' Association, in the columns of the American Agriculturist for July 11, to the subject of the distribution of the Apple crop. This matter is worthy of the careful consideration of English as well as of American fruit growers.

The author says that the Apple, the king of all fruits, will continue to occupy the front rank on the marketa, and the question is to reach and supply this market and the ever-growing demand in the most practical and economical way. It is true that the Apple crop of 1895 in America was a very large one, and for low prices and glutted markets had no equal

for many years in the western districts, though the situation was better in the east, owing to the reduced crop in that part of the country. And yet what are facts to-day? Good Apples are in demand at fair prices, and thousands of families, even in the best Apple-growing States, did not have an Apple laid in for winter.

That the demand has increased much faster than the natural increase of population, is also a fact in which all who have handled fruits largely agree. The author mentions that when he commenced shipping Apples twenty-six years ago, a car-load to any town west of the Mississippi, excepting a few large cities, was enough to cause a glut in the market. To-day there is room for several car-loads, even in small towns. So long as civilisation and education progress, one may look for an increased demand for fruit. But the chief question now, and one which under

Apples mature within a period of about three months, and to distribute this crop over all of the year, will require much intelligent labour and good management, as well as the investment of much capital. Cold storage, and other methods of keeping fruit, properly-constructed fruit cars, cheap and rapid transportation, are indispensable for the successful handling and marketing of Apples in the future. But to attain this it is necessary that we should follow and encourage specialties of occupation. The fruit-grower, to do this work well, and reap the largest returns from his orchard, will find full employment for his energy, mind and body, in order to master that special calling. He will have no time to look up the markets, to reach the consuming masses, to look after cold storage, and other requirements of distribution.

It is the author's firm conviction that the most eco-

Fig. 47.—BRODLEA PEDUNCULARIS,

Inflorescence half-size; flowers real size, rosy-purple. (See p. 2. ")

existing conditions may not be easy to solve, is how, when, and by what method may orchardists reach and supply, for the entire year, this ever existing and growing demand! From the author's twenty-five years' active experience in packing and shipping Apples, he would recommend, first, education; second, distribution; and finally, specialties of occupation. By education is meant that the fruitgrower should know what varieties of Apple to plant, how to plant, cultivate, and gather at the right time, and in the best possible manner. The dealer must be well informed in his business so that he may properly pack and distribute. The main idea is honest and fair dealing. Deception practised by either the dealer or the grower has in the past worked great injury to the Apple trade, decreased the demand for Apples, and glutted the markets more than any other thing. The grower should learn that he must not expect the high prices of years ago, when Wheat was selling threefold higher than it is to-day, neither should the dealer expect to make the profits of those days.

nomical distribution can be done only through large establishments with invested capital, whether such be cold storage, canning factories, evaporators, cidermills, distilleries, vinegar, jelly, or other factories, any one of which is a business of itself. And to make them efficient and profitable, and to keep up with the requirements of the trade, the employment of much capital, skilled labour, intelligent management, and the careful studying of specialties will be required. J. J. Willis, Harpendon.

HOME CORRESPONDENCE.

THE SCARLET BEAN AS A VEGETABLE.—With reference to your correspondents remark upon my former letter, I find that Colpepper in his Herbal refers only to the Dwarf French Bean as being edible; the Scarlet Bean is mentioned as a medicine in kidney diseases, in doses of one eighth of an ounce. I have myself eaten Scarlet Runner Beans forty years ago—but I distinctly remember, some twenty years ago, an old lady who often remarked to me that in

her mother's days no one thought of eating them: they were grown simply for ornament, and as a medicine. I had not seen Culpepper's Herbal at the time I wrote, but the stitement in this work agrees with whit I had previously heard as to the actual facts. Two. Fletcher, Grappenhall, Cheshire.

A PROFITABLE METHOD OF UTILISING SPARE TIME.—To talk of spare time, from a gardener's standpoint, during the spring and summer months seems to be altogether out of place, for there is so much to occupy the gardener's attention during the early months of the year, that little or no time is lett for profitable recreation in any shape or form. Quite the reverse condition is experienced during the long nights of winter. Time then begins to hang. It is quite true there are organised societies for the improvement of young gardeners, where papers on different subjects relative to the profession and general work of gardeners are read and discussed, to the advantage of all concerned; but these are found principally in the sore-of young gardeners, whose lot is not so favourably cast (being, as they are, in places sometimes many miles distant from any town), who have not the alvantages of such societies, and who are sometimes many miles distant from the societies, and who are sometimes as the societies are sometimes. times at a loss to know how to pass their time profitably. How to muintain a lively interest in mutters horticultural under such circumstances has been a matter of considerable perplexity to many an able head gardener, who feels interested in the prosperity of the young men under his charge. are employed making labels, Orchid-baskets, and other us ful articles, all of which may be made in the bothy without any great inconvenience during the long nights of winter; but while all this may be of some pecuniary benefit, there is really nothing gained from an educational point of view. It was the consideration of this subject of putting spare time to good use which prompted me to throw out a sugges-tion on Fern-drying and mounting, which, if acted up), I am sure will be found both pleasant and pronuble. There is no great art required in drying and mounting Fern-fronds, while the result amply repays anyone for all the time and trouble which they may expend in the work. Well-developed fronds may be gathered during the summer months, laid carefully between sheets of coarse paper, covered with thin boards, and then pressed by means of books or anything else handy. They should be kept in a cool dry place for four or six weeks, when the weights may be taken off and the fronds placed between ordinary sheets of paper until there is time to mount By this means the sap in the frond is absorbed, them. By this means the sap in the frond is absorbed, and the colour still maintained. Mounting is a very simple process, although it entails the expenditure of much more time. It is nevertheless a pleasant occupation, and the work will be enjoyed during the long winter nights. The fronds may be mounted on loose sheets of drawing paper, or better still in an ordinary scrapalbum of large size. They may be secured in position by means of ordinary stamp paper cut into saort narrow strips, and pasted across the main stems of the frond. This is by far the quickest method, and is preferable to pasting, as it is rather difficult to get paste to stick to many Ferns, pardifficult to get piste to stick to many Ferns, particularly the varieties of Adiantum. Only one species should be mounted on each leaf. It is the better plun, if mounting in an album, to mount only on one side of each leaf, as by so doing the fronds are not damaged by rubbing against each other.

After this is done, the name should be written at the bottom of the page, together with short notes, on the habit and culture of each particular variety. By this means a beautiful and instructive Fern album is obtained. Every allowance must be made for the important part which books play in the gurlener's profession; and admitting that "reading makes the full man," it is none the less true that "writing makes the correct man." Any person who will read up information on the habit and culture of each particular variety, and then after he has mounted each frond, accompany it with foot notes on its chief chiracteristics, or any particular method of treat ment which he has found to prove successful in his own practical experience, will so thoroughly acquaint himself with their requirements, that it will be diffi-cult for him to forget, even through the many and varied experiences of life. P. Wilhinson.

GARDENERS' WORKING HOURS.—In a previous issue of the terril west Chronicle, 1 noticed a paragraph respecting the resultinstance of the Saturday's working hours at the Royal Horticultural Society's Gardens, Chiswick. I have kept silent since that notice acopeurel, thinking some one would have

written in praise or the reverse of the innovation, but I have not seen a single allusion made in reference Had a definition of a nursery foreman's qualifications been given instead, as that, for example, which appeared in the Gardeners' Chronicle a few weeks ago, your columns would have been flooded with much correspondence on the subject; or, on the other hand, if the requirements of a gentleman's gardener had been mentioned, or the subjects connected with the practice and science of gar lening enumerated as indispensable for a young man desirous of attaining proficiency in his profession to know, the result would have been the same. So far, so good. I have worked hard both in the gardens at Kew and at Chiswick in the "good old days" (1), when the wages paid to young men were as low as 14s, and 15s. a week, and the working hours from 6 A.M. to 6 P.M., and at the latter place an hour or two more on occasion, but no extra pay was given, nor any grace allowed after 6 A.M. I earned my certificates under very harl pressure, and some may imagine, as did many of the noted gardeners of that day, that "grinding" of such severity was for our benefit.
Only those who have toiled in hot-house and outside for so many hours daily can fully appreciate the delights of relaxation from toil for one brief half-day on alternate Saturdays. I think that the term "student" could be more strictly applied to the young men of that day than now. At Kew we all seemed anxious to excel, and not a few of us walked on Friday evenings to attend a physical geography class held nearly four miles distant, not to mention attendance at freehand and geometrical drawing lessons given outside Kew Gardens. Most of us knew how to value Dr. Hooker's training, and the advice he gave; and not a few profited thereby, as was shown by their management of large concerns in after life. I have had the charge of large establishments, and notably in one I tried the effect of the Saturday halfholiday, purely from sympathetic motives, as I well knew what a boon it would have been to me in my youth. The workmen cordially appreciated the little relaxation from work accorded them, and the firm was no loser by the alteration. The managers, although reluctant at first, admitted afterwards that The managers, they had no reason to complain. May the new superintendent of Chiswick be able to act similarly. Undoubtedly much credit is due to those who made public the new working code, which, I trust, will awaken some sympathy amongst the owners of our large trade establishments. T. H. Smith, 70, Deacon Road, Kingston-on-Thames.

TENACITY OF LIFE IN TREES.-I observed a few days since a remarkable illustration of the extreme tenacity of life shown by large trees under very adverse circumstances. Some time last year I mentioned in these columns a case in which a number of horses turned out into a meadow in which were growing not only many fine Elms, but also numerous pollarded Willows, had been, apparently by stress of hunger, driven to eat away the bark right into the hard wood to a most unusual and harmful extent. Passing the meadow recently, I found that not only were all the injured Willows dead, but also that every Elm or other tree on which the bark had been eaten all round the stem was dead also. But there were some two or three fine Elms on which every portion of the bark on the stems as high as the animals could reach had been gnawed off except, perhaps, to the extent of some 12 to 15 inches in width at the back and sides next the fence, where the horses could not get access. These trees were apparently in as full leaf and vigour as were any others quite uninjured. Thus on large stems of from 7 to 9 feet in circumference, and from which five-sixths of the bark had been remove I several feet in height, yet all the functions of the trees were carried on apparently in the most perfect way through the uninjured one-sixth width of burk left on the stems. That seems to be remarkable evidence of tennety. How long it may be possible under such conditions for life to continue remains to be seen. Possibly the case is not a singular one, yet it is, I think, well worthy of notice. .1. D.

PRINCESS OF WALES PEACHES.—The fruit herewith is from a tree grown on a trellis, and covers about 112 superficial feet. It has borne this year 103 fruits of the average weight (9 ozs.), although the weight of each of the fruits sent is 12 ozs. I have been gathering fruits of the Noblesse Peach of 8 to 10 ozs. weight each. Helley Warren, Aston Clinton, Trany. [Very fine, light-coloured examples of Princess of Wales Peach; but their damaged condition prevented any test of their flavour being made. Ed.]

FORMALDEHYDE.—The question asked in the Gurdeners' Chronicle as to the experience of any reader in the use of formaldehyde in the preservation of fresh or dry botanical specimens, onght to produce various experiences which brought together should be of much value. My own experience with this preservative fluid during the past year in the Kew Museums has been on the whole favourable with regard to the preservation of colour in fleshy fruits, especially those of a red colour; whether it will preserve the substance of the fruits for so long a period as alcohol cannot yet be determined. In my temporary absence from Kew I am unable to give any data, but may revert to the subject at a future time. John R. Jackson.

THE WEEK'S WORK.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

EAST INDIAN DIVISION .- In this warm division the Vandas, Aerides, and Saccolabiums, although still rooting freely, will in a few weeks have completed their growth. Prepare the plants for that period by commencing to lessen the amount of water afforded at the roots. During the summer the sphagnum-moss has been kept growing by the moisture afforded, but after this time it should be allowed to assume a whitish appearance before any water is applied. A fairly moist atmosphere should be maintained about the plants till the roots cease to grow. During the daytime, while the weather is warm, admit plenty of fresh air. Close the house moderately early and allow the temperature to rise between 80 and 90° with sunheat, but without sun to about 75, and damp well between the pots. Immediately the sun commences to decline draw up the blinds. In the evening one or more ventilators may be partially opened, according to the ontside temperature; if the thermometer falls to 70° sufficient fire-heat should be employed to maintain it at that degree throughout the night. If by the morning the temperature is below the figures indicated, no damping down should be done until the glass registers a few degrees above that of the night temperature. Any freshly-imported plants of Acrides, &c., that have become rooted in crocks, or on to Teak-wood baskets, may now be "mossed" up; also old-established plants that have lost a number of their lower leaves should have the surface-moss removed, and additional drainage afforded, and the cone of sphagnum-moss raised considerably up the stem. Some of the imported plants, when they have made a few roots, are apt to produce flower-spikes, but these should be pinched out at once. Acrides Lawrence and its buff coloured variety, Sanderiana, are now showing their flower-spikes, and should be liberally supplied with root-moisture until the flowers are past. Any small weakly plants or unhealthy specimens should in no case be allowed to produce a spike. Many of the Catasetums and Cycnoches are also developing their flower stems, requiring to be looked over each day, and thoroughly watered if found to be dry. At the present time, when the growths are nearly made up, these plants should be afforded all the sunlight possible, providing that plenty of air be given them at the same time. Continue such treatment until the leaves commence to change colour. when the plants should be removed to a somewhat cooler temperature, and to full sunshine. Immediately the leaves begin to turn yellow, the amount of water should be gradually reduced until all of them have fallen off, when it should be discontinued

MORMODES, THUNIAS, AND CHYSIS. - The Mormodes require similar preparative treatment to the Catasetums before resting, but they should be placed in the intermediate-house. The Pleiones having now completed their bulbs, require plenty of light and air, although there is no necessity to expose them to full sunshine to induce them to flower. Suspend them, together with the Dendrobes that are maturing their bulbs, in the greenhouse. The compost should be kept merely moist until the first flowers open, when water must be withheld, or the blooms will quickly damp off. Although the Thunias have long since done flowering, they retain their foliage, and being in a dry atmosphere and full sunlight, this frequently becomes infested with red-spider, therefore the plants must be constantly examined and cleansed, otherwise the pest may spread to other plants. Chysis bractescens C. Chelsonii, C. aurea, C. Sedenii, and C. lavis should now be taken from the Cattleya-house and placed in a few degrees more heat, to enable them to finish up their growths quickly; they still require plenty of root-moisture.

THE KITCHEN GARDEN.

By C. HERRIN, Gardener, Dropmore, Maidenhead.

LEEKS.—The earliest planted Leeks will soon require to be earthed up; and before this is commenced, afford them a copious watering with weak liquid-manure, Leeks requiring an abundance of moisture. Do not earth-up too much at the first operation, and take pains to prevent the soil lodging in the hearts of the plants—it should, in fact, be kept well below the centres. The later plants should be kept well supplied with moisture, and freed from weeds, and if the trenches are of sufficient width, the surface-soil should be stirred with a small hoe.

LATE PEAS.—If dwarf, early varieties were sown as advised in a previous calendar, they will now be sufficiently high to allow of a portion of the soil from the sides of the trenches to be drawn up to them. Short sticks should be used to support the haulm, more especially at this time, when heavy rains may be expected. Rain has, in fact, fallen during the past week, but in many districts it has not been sufficient to moisten well-furnished rows of Peas now podding or coming into bloom, and these should still be supplied with water and liquid-manure occasionally, unless a much heavier rainfall should occur. The same remark is also applicable to Runner Beans. Of late Peas, one of the best for a dry season I find to be the old Ne Plus Ultra, which has podded remarkably well here during the past month, notwithstanding the intense heat and drought. It is very prolific, and although the pods are not large, they fill quickly, and are of capital flavour. Where birds are troublesome at this season, fine-meshed netting must be placed over the rows of Peas, and, if necessary, extra sticks may be placed along the sides to keep the netting far enough away from the Peas to prevent the birds reaching the pods.

TURNIPS .- Now that there has been a small rainfall, make a final sowing. This will probably produce a useful supply of roots, as the earth being very warm a quick germination will be certain. Land from which Potatos have been lifted will do capitally for this, without any further preparation, beyond levelling and applying a surface dressing of soot. Sow the seeds broadcast, and rather thinly, afterwards, rake in. Snowball and Red Globe are two good varie-Seedlings from the previous sowing are now ready for thinning. Do not delay doing this, for when thinned out after the plants are larger, the soil is left in too loose a state. A dusting with a mixture of soot and wood-ashes should be given occasionally, to keep off birds and insects; it will also act as a stimulant. If thinned to 6 inches apart each way, this will now allow sufficient space for the white varieties, but rather more may be allowed for the Red Globe.

CARDOONS are in full growth, and should receive liberal supplies of liquid-manure. Remove any dead leaves or suckers from the base, and the strongest leaves may be tied up loosely, to prevent them from being broken down.

THE HARDY FRUIT GARDEN.

By G. Woodoate, Gardener, Rolleston Hall, Burton-on-Trent.

STRAWBERRIES.—Any well-rooted runners of Strawberries may still be planted, and they will produce fruit next season; but the work should be completed as soon as possible, so that the roots may get hold of the soil, and the plants have time to develop their crowns before the winter commences. Rnnners that were planted some time since, and have produced other runners, will need frequently to be looked over, and all such growths removed. ground clean, and stir the surface frequently with the hoe. Plants in older beds should have all runners and dead leaves trimmed off, and the dry, strawy portion of the mulching that still remains upon the ground removed. If the ground intended for a new planta-tion is still under other crops, turn the layered plants out of the pots, and plant them in nursery-beds, where they may remain till the land is in good condition for planting in the spring.

APPLE AND PEAR TREES.—Pyramids and other dwarf-growing trees, which were pruned the earliest in the summer, have produced numerous lateral growths, and these should now be pinched or cut-back to one leaf. Any trees that have been neglected in the matter of summer pruning, should now be attended to, otherwise the strength of the trees will be wasted in forming growths, which will have to be cut away during the winter, entailing the loss of a season's fruit, beside encouraging a multiplicity of wood growths in the following year. Examine the ties

which secure the young scions to the supports on grafted trees, and if any are found to be pressing into the bark, let them be untied and refastened before the rough autumn winds are experienced. Allow the new growths to extend their full length this season in order to encourage root-action, and remove all suckers which arise from the stock.

FILBERTS. — Where squirrels are numerous, means must be taken to prevent them from carrying away the fruits. It may seem a pity to kill them, but I do not know of any other way to save the crop, which with us is a very heavy one, although the Nuts are not quite so large as usual owing to the drought.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

GENERAL WORK .- The recent showery weather has greatly altered the appearance of the lawns and flower garden, and the bulk of the work in these departments will for awhile consist in sweeping, rolling and mowing. Grass-verges must again be kept trimmed now that the grass is once more growing rapidly. The carpet-bedding, too, will also need care in the same way, in order to maintain the outline of the various designs. Single Dahlias have seeded freely, and should be promptly relieved of the seedotherwise the flowering period of the plants will be considerably shortened; the same remark will apply to Verbenas, Violas, Calceolarias, Tropæolums, Gladiolus, Helianthuses, Hyacinthus candicans, &c. Clumps of Pampas-grass now in full flower have a very pleasing effect, especially as large isolated clumps on the lawns and pleasure-grounds. Sub-tropical plants, such as Richnus, may need a few of the lower leaves taken away, if the beds have been carpeted with dwarfer-growing subjects, otherwise the latter will suffer from shade. Propagation should be continued as circumstances will allow. Cuttings taken at this late date will need protection, and in some instances a little artificial heat, to encourage the formation of roots, so that the stock of plants may become quito established before cold or searching winds occur. Variegated Thyme, Lencophyton Browni, Gnaphalium, and others will root freely, if the cuttings be inserted in sandy soil and placed in a cold frame. These plants should be propagated in the autumn, as they then produce far better plants for next season's work, than if propagated in the spring. Trivet and Yew hedges may be clipped, and where necessary, Box edgings should receive a final clipping for the year. Spring bedding plants, such as Myosotis, Wallflowers, Silene, Primroses, and others, should be transplanted, so as to grow into good material for use in the flower garden at a later period. A list of the various sorts of bulbs required for use in the beds and horders should be written out and an order given for the same at once, so that no delay and disappointment be experienced later.

MOUNTAIN ASH.—This deservedly popular tree is now beginning to assume its usual autumn colours. To brighten up dull spots or corners of the shrubberies, it is excellent, being a profuse-flowering tree in the spring, and ornamental when covered with its clusters of bright coral-coloured berries. It is seen to full advantage, however, when planted in an open position, where its growth is even and regnlar, and where the proper contour of the tree may be seen. In exposed positions on the lawns or pleasure-grounds, where less hardy trees fail to grow, it will thrive, and afford a pleasing contrast to its surroundings.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gardener, Woodside, Darlington.

BULBS.—The receipt of bulb catalogues serves to remind one that it is time to consider what the selection for the coming season shall be. The first or earliest batch of Roman Hyacinths should be potted forthwith. The most suitable pots to use for them are those of 5 inches in diameter, which are suffieiently large to contain five bulbs: and a light, rather rich compost will suit them well. These early bulbs need to be plunged in ashes for at least two months, as if they are brought into heat before they have made sufficient roots, they will not flower satisfactorily. Ixias and Sparaxis are very useful for forcing purposes, and need the same kind of culture as Hyacinths, except that at no time should they be placed in a high temperature—one of 50° to 60° being quite sufficient. If this condition be not observed the spikes become weak and thin; neither should they be forced very early, as they require some time to become established. The following are good varieties:-Ixias,

Emperor of China, Erasmus, Excelsior, Conqueror, Galatea, White Swan, Vulcan, Crateroides, and Viridiflora. Sparaxis: Bertha Johansen, Garibaldi, maculata, Paragon, Queen Victoria, Victor Emanuel, Lady Carey, and Lady Franklin.

LILIUM HARRISI.—For general purposes these bulbs may be put into 5-inch and 6-inch pots, which will be found quite large enough for one bulb in each. If large plants be desired for conservatory work, put three or four bulbs into 8-inch or 9-inch pots; in either case using good fibrous loam and leaf-soil, not too finely broken up. Place the bulbs on sand, and when potted, plunge them in sifted coal-ashes. This bulb is not quite so hardy as are some others, and in cases of severe frost, they should be protected by litter or some tree-leaves.

EUPATORIUMS and other plants which are grown especially for winter flowering, will need attention. Eupatorinnus are exceedingly useful winter-flowering plants, of very easy culture. They should be placed outside during the summer, and several times pinched during growth, when they form dense plants, and produce abundance of bloom in November and December. Pinching should now be discontinued, and the shoots allowed to show flower. If confined at the roots and given abundance of feeding, they do capitally.

CYCLAMENS.—The old corms if planted out in frames as recommended, will now be showing signs of growth. Spray them overhead each night and morning, and keep them rather close until they are growing freely. Shade is very essential to them in the early stage of growth, and frames placed so as to have a northern aspect are preferable. The lights also may be given a good coating of "summer cloud" or other shading. In no stage of growth should Cyclamens be exposed to hot sum. Young plants raised from seed last year will require a little extra feeding; and Clay's Fertiliser is a very suitable one tor this purpose. Give a teaspoonful to each plant twice a week, and water it well in. This will keep them growing vigorously, and may be continued until they have developed their flowers.

ERICAS.—If these are showing flower rather earlier than is wished, remove them to the north side of a wall, and place a sash-light over them in the event of heavy rains.—The early varieties that are now over may be re-potted, there being no better time to re-pot Ericas than immediately after flowering. The peat for the purpose should be of a hard, gritty nature, a soft spongy kind being most unsuitable. A good sprinkling of coarse Reigate silver-sand added to the peat, is all that is necessary for them. The potting should be done firmly, the pots quite clean and drainage very good.

FRUITS UNDER GLASS.

By W. Pore, Gardener, High tere Castle, Newbury.

PEACHES AND NECTARINES: EARLY-FORCED TREES. When the foliage begins to fall generally, the trees should be unfastened from the trellis, and the required amount of pruning done, which, ever, will not be much if proper attention was afforded to thinning and pinching in the season of growth, and after the crop was gathered. The Peach-house should be cleaned, washing the wood and trellises with hot soapsuds, but keeping this, bowever, off the glass, which should be washed clean with water only. Painting may be done where necessary, and the walls lime-washed. It will be well also to wash the trees with warm water in which a small piece of soft-soap is dissolved; or, if they are infested with scale or other insects, dress them with some approved insecticide, taking care to get it into every erevice of the bark. The worn-out mulch on the borders should be removed, together with some of the surface-soil, and a top-dressing of fresh loam applied, to which one-sixth of plaster or mortarrubbish is added, and a smaller proportion of sifted wood-ashes. If the soil is found to be dry, afford the borders a moderate watering, and fasten the trees neatly to the trellis as occasion offers, allowing full exposure to the air till the time arrives for starting e trees. If the roof-lights are removable the roots will be kept sufficiently moist by the autumn rains. f not, care must be taken to guard against any dryness in this direction by occasional soakings of water.

LATE HOUSES.—Trees now swelling their crops require liberal root-waterings till the fruit is well advanced towards ripening, when the supply should be reduced, but still supplying sufficient to keep the foliage in a healthy condition. Take note of any that may be making too much or too late growth, and as soon as the crop of fruit is gathered lift them care-

fully; or take out a french round the trees at about 4 feet from the stem, and sever the large roots, filling the trench with fresh compost, so as to encourage the formation of fresh fibrous roots.

VINES IN LATE HOUSES .- The fruit on late Vines should now be advanced in colouring; in some districts they will need to be assisted amount of artificial heat to finish them, and enable them to keep well throughout the winter. A temperature from 70° to 75° should be maintained during the day, and 5° to 10° less at night, allowing a rise above the day figures when the sun shines, a free circulation of air being permitted at all times in fine weather Aërial moisture must be gradually reduced as the crop of fruit matures, although Vines with fruits still swelling will need a moderate amount, and occasionally the border may need to have water applied to it, but the need or otherwise should be ascertained by a test-stick or by excavating a hole. Reduce lateral growth, not, however, removing much at one time. Preparations should now be made for covering the outside borders where Grapes are required to hang for any length of time, as the fruit will not keep well if the border is unprotected from rain, and for this purpose thatched hurdles, such as are often used for protecting wall-trees in spring, answer the purpose if given a sharp pitch.

THE APIARY.

By Expert.

FEEDING BEES FOR WINTER.—All driven bees should be fed as soon as they are put in the bar-Two or three driven lots may be put framed hives. together to make a strong colony, and being fed according to the following receipt, will make a strong stock for early work next spring:—10 lb. sugar, 5 pints of water, about 1 tablespoonful of salt, and 1 ditto of vinegar, with 1 ditto of salicylic acid solution. Boil this for a few minutes in an iron boiler or tin fish-kettle, so that it does not burn, and be careful it does not boil too long, or it will form When ready keep in a closed candy. or the bees will commence to rob. A useful and cheap feeder is made by punching several small holes in the lid, from the inside, of an ordinary treacle-tin (2 lb. size the best); when filled turn sharply over (seeing the lid is securely fixed), and place on the top of the bars, putting a piece of perforated zinc under the tin on the top of bar frames. If quack-feeding is required, it is best to purchase a "rapid feeder," which saves a lot of trouble and time. The bees should be placed. after being driven on full sheets of foundation wired to keep the combs in place, and a stock can be fed up in about a fortuight with from fifteen to twentyfive pounds of sugar made from preceding receipt. Commence as soon as possible to allow the bees to seal over the combs before the cold weather begins, as unsealed combs will often give bees dysentery. Examine the hives in which the bees have done badly, and cut out or replace all black old combs, and thus allow them to start as soon as possible to make up the loss of combs taken away. Do not hesitate about doing this, as it will pay better next season, only be sure to feed well: and replace naphthaline in hives where it has evaporated, but do not put more than half-an-inch piece, as it has a very strong odour. Keep some water in shallow pans by the laves for some little time longer, as the bees are apt to seek it in ponds and ditches, and so get drowned.

CARRYING DRIVEN BEES .- A useful and convenient method of conveying bees is to have a body box made, with the entrance and top covered with perforated zinc, so that the bees can be shaken out of the skep, which they have been driven into, into the box, which should be provided with five or six frames, with combs wired in to keep them from clustering, and consequently sufficating. There should be fillets and consequently sufficating. There should be fillets all round the lid of the box about an inch in depth. which will allow the bees to pass over the tops of frames, and to go down, whereas if the lid fitted close on the frames, a great many bees would be crushed; the frames, of course, should be provided with metal ends, to keep a certain distance apart, as this allows a little more space, and gives the bees an opportunity to get more air, which is important on a very hot day. Another very good plan is to get an ordinary Hud-son's soap-box, nail down the lid, and cut out one end, and fill-in the space with perforated zinc, and drive the bees into this, the hd being secured by a little iron pin. When conveying bees in skeps keep the latter mouth upwards, with a clean cheese-cloth or piece of muslin tied over it, and as soon as possible emity them into their new home, and feed at once.

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guaranter of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, unless by special arrangement.

Illustrations — The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees. &c.; but he cannot be responsible for loss or injury.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR SEPTEMBER.

UESDAY,	SEP1.	I National Chrysanthemum Society, Show of Daldias, Gladioli, and Chrysanthemums, &c., at the Aquarium (2 days).
WEDNESDAY,	Sert.	2 Glasgow Horticultural Show, Ancient Society of York Florists (5th show).
THURSDAY,	SPPL	::-Dundee Horticultural Sh. 2 days)
		4 National Dahlia Society, Exhibition at Crystal Palace (2 days).
SATURDAY,	St.Fr.	Wellingborough Dublia Show, Sociéte Française d'Horticulture Meeting.
SUNDAY,	SIPT.	6 Royal Agricultural and Horticul- tural Society of Ghent.
TUESDAY,	Surt.	Royal Horticultural Society's Committees.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK —61'1°.

THE National Co-operative Flower

Show, which commenced in a

small and nupretentious way in the then conservatory of the Royal Horticultural Society at South Kensington a dozen or so years ago, bears witness to-day to the universal truth of the old adage that the day of small beginnings should never be despised. Mr. EDWARD O. GREENING, the founder and organiser of this great National Co-operative Festival, which has ramifications independently of the Flower Show, and widely diversified, is one of the most sanguine of men; but even his keen foresight could not, eleven years ago, have had any conception of the extraordinary growth of the movement of which he has been the guiding spirit. On the 22nd inst. a display of horticultural productions, such as plants, flowers, fruit and vegetables, filled the available space in the nave of the Crystal

Palace. These were drawn from various parts of the country, contributed in goodly proportion by gardeners, but still more largely by amateurs, who come under the denomination of cottagers, and of whom a considerable proportion consists of artisans. Not a single trade exhibit was observed, a fact almost without parallel at London exhibitions, and it was competitive contributions alone which made the show, reared in hundreds of small gardens by men and women, who, in all probability, previous to the establishment of this festival, had taken but little interest in their gardens. It is semething to the credit of the co-operative principle that it has been the means of inducing large numbers of persons to attempt the culture of plants, and called into existence a liking for gardening where it had previously been lacking.

Those who saw the first two exhibitions which were held at South Kensington, will recollect the rather poor character of the productions, many of them large in size, and ungainly, and contributed apparently in the belief that bulk alone would find favour with the judges. The decisions come to by the judges at the first two exhibitions proved valuable lessons to the memhers, who were not slow to draw the conclusion that symmetry, clearness, cleanliness, and evenness, in combination with desirable size, were the essential and most desirable characteristics in roots and vegetables; and when the third exhibition was held at the Crystal Palace, the advance in the direction of increased good quality in the exhibits was very marked.

The lessons gradually learned by the exhibitors led in time to greater taste being shown in setting up the exhibits; and the later exhibitions have borne evidence to the fact that the produce is characterised by improved good quality. It was freely acknowledged by those who have acted as judges from the beginning, that despite the unfavourable conditions of the season, the quality of the exhibits was never higher or so generally displayed as at the recent show.

The number of entries keeps pace with the improvement in the quality of the exhibits. This year they amounted to 4231, a substantial increase on those of last year, which was regarded as a record one. This fact justified the remark made by Mr. E. O. GREENING at the opening ceremony, "That it was a striking proof of the remarkable popularity of this show that such a result should occur in a year of prolonged drought, which had practically withered up the produce of so many gardens throughout the land, and had forced the ripening in July of flowers we usually expected to be just ready for our show in August." How much clerical work is entailed, and hew much labour is required in the preparations for and arrangement of the exhibits, can well be imagined. The work was got through in good time, and the judges discharged their duties with comfort and dispatch.

Mr. Greening's analysis of the entries gave some interesting facts. There had been a decrease of between 300 and 400 entries from the gardeners of gentlemen who are members of the Agricultural and Horticultural Association, but there is a corresponding increase in the sections in which working-men exhibit—which is highly satisfactory.

To attempt to set down details of the exhibition is not necessary, as they would weary by their copiousness. It may be remarked that the schedule of prizes is divided into two sections; the classes included in Section II. are for members and customers of the Agricultural and Horticultural Association, Limited, most of whom

employ gardeners. Fruit and vegetables were contributed in fine character by these, and all the exhibits in this section were staged and judged on Friday, the 21st. On the 22nd, the exhibits in Section I., all contributed by werking people only, were staged and judged, and sixteen judges were therefore engaged for two days in making the awards. Of the working-men's exhibits, it may be said that such vegetables as Peas, Potatos, and Broad Beans fell below their usual extent—the Potatos, with few exceptions, showing much roughness; Carrots, Parsnips, Runner and Dwarf Beans, Vegetable Marrows, Onions, Beet, &c., were very good. Cut-flowers were delightful, and those among the visitors who were interested in common flowers, found in the charming bunches of hardy annuals much to interest and instruct. There were divisions for ladies and children, and in each of these there was a remarkable increase in the number of the entries.

One unique feature was the section devoted to photographs of gardens of taste. As Mr. Greening remarked, exhibitors could not bring their gardens to the Crystal Palace, and therefore they had to be content with photographs of them. They appeared as front gardens, as backyards, besides porches, windows, &c., many very pretty pictures being forthcoming. Some 200 of these were placed upon screens, and they were closely examined by the visitors. It is hoped that the exhibition of these "would inspire many with a desire to emulate the example of those who had succeeded in adorning their homes with the highest forms of beauty, and the purest sources of delight."

Mr. Greening, who is always devising some new features in the annual exhibition, hit upou the expedient of inviting the exhibitors and others to tea on the evening of the first day, and requesting the judges to meet them, and so interspersed general addresses with pleasant song. The large attendance showed how much the gathering was appreciated, and this sort of reunion will no doubt become an annual feature. If it be true, as a modern writer has stated, that "the social virtues contre in the stomach," then Mr. Greening is right in seeking in this way to disclose the dormant amiabilities which make themselves manifest under such circumstances.

A MEETING OF THE FLORAL COMMITTEE OF THE ROYAL HORTICULTURAL SOCIETY AT THE FRUIT SHOW AT THE CRYSTAL PALACE.-Mr. RICHARD DEAN, Ealing, W., remarks: -It will be in the remembrance of some that on the oceasion of the annual general meeting of the Royal Horticultural Society, I ventured to make a suggestion to the council whether a meeting of the Floral Committee could be held at the Crystal Palace in connection with the great exhibition of British fruits on October 1. My reason for making this suggestion was, that there is no meeting of the Floral Committee at the Drill Hall between September 8 and October 13, a period of five weeks, and that interval occurs at a time of the year when new Dahlias especially are numerons, while it is the season for other novelties in flowers to be seen at their best. The council promised to consider the suggestion. Finding that no announcement had been made by the council in reference to this matter. I communicated with the secretary of the Royal Horticultural Society, who replied to the effect that "by the arrangement we have with the Crystal Palace we are specially precluded from inviting exhibits of anything but fruit, and we have only been able as yet to get permission for a few decorative groups if no awards are made to them. It is possible we may be able to make some other arrangements for next year, but I fear not for this. All arrangements are perforce made before the annual meeting.

Fig. 48. -DELPH MI M ZALIL: FLOWERS PALE YELLOW. (SEE P. 23%.)

"JOURNAL OF THE NATIONAL HORTICUL-TURAL SOCIETY OF FRANCE," CHRYSANTHEMUM SECTION.—The first number of this publication, which is intended only for members of the Chrysunthemum Committee, has recently come to hand. It is a paper-covered brothure of twenty-six pages, and contains the regulations of the committee, names and addresses of its officials, list of members numbering sixty-seven in all, and including most of the eminent raisers in France; an interesting and rather lengthy essay by Mr. George Truffaut on the cultivation and vegetation of the Chrysanthemum; an article by Mr. NONIN on M. LIONNET'S Chrysanthemums; and the schedule of the Society's Show to be held on November 17 to 22 next. A somewhat similar publication is promised to its members by the French National Chrysanthemum Society at Lyons.

THE ROYAL GARDENERS' ORPHAN FUND.-Among recent contributions to the Fund is a sum of £7, received through Mr. G. W. Cummis, for flowers sold at the Croydon Summer Flower Show; a similar amount for the sale of flowers at the Chislehurst Show, per Mr. J. Lynch; a sum of £5 from the Secretary of the Wimbledon Horticultural Society, being the proceeds of a sale of flowers; and 15s, from a box, per Mr. J. H. WITTY, Nunhead. These sales of flowers afford horticultural societies a good opportunity of helping a very deserving charity without in any way impairing the funds of the societies. There is no difficulty in obtaining flowers, or the services of competent persons to sell them. Those who have experience of flower-shows know that many persons who attend them are desirous of earrying away some of the flowers from them, and will purchase faded ones rather than go with none at all. It is purely local work, and as most committees would be willing to allow a table to be placed in one of the tents free of cost, the expense attending upon such sales would be quite small.

"The Jardin des Plantes."—From Paris we receive several photographs showing the disastrons effects of the storm of July 26. Trees were snapped off in the centre, and one at least fell in the frame-yard, doing much injury to the plants. A Paulownia from Japanese seed in the herbaceous ground presents a pitiable spectacle, whilst the original type of Gleditschia monosperma of Descontaine is uprooted.

SHIRLEY AND DISTRICT GARDENERS' AND AMATEURS' MUTUAL IMPROVEMENT SOCIETY .-The monthly meeting was held at Shirley, Southampton, on Monday, the 17th inst., Mr. B. Laduams, F.R.H.S., presiding over a poor attendance. Mr. E. J. Willox, The Gardens, Alderwood House, contributed a paper on "Garden Annuals," dealing with Lardy and half hardy subjects. The paper was illustrated by cut specimens of about sixty species and varieties. Some of the species, &c., although old inhabitants of gardens, seemed to be unknown to a portion of the audience; and a few novelties were shown. Mr. Wilcox strongly urged thin sowing and hard thinning out as being very necessary to the true development of these plants, which had suffered much in reputation through being sown thickly and

POMOLOGICAL SOCIETY, BOSKOOP, HOLLAND -On the occasion of the meetings of April, May, and June of the Plant and Fruit Committee of this society, the committee awarded a First-class Certificate to the following plants :—Azalea rustica, fl.-pl., Director C. Ohrt, raised from seed by Messrs, P. Van Noordt & Son, Boskoop : Azīlea mollis, Vondel, and Margaret Cornelia, raised from seed by Messrs. Koster & Co., Boskoop ; Azalea rustica, fl.-pl., Byrou and Praxitele, introduced by Messrs, P. Van Noordt x Son, Boskoop ; Rhododendron hybrida Heliene Schiffner, introduced by the same firm. A Second-class Certificate was awarded to Azalea rustica, fl. pl., le Titien, Ribera, and Murillo, and Rhododendron hybrida Kaiser Wilhelm, all introduced by Messrs. P. Van Noordt & Son, Boskoop; Hedysarum multijugum, introduced by Mr. K. Wezelenburg (C. de Vos) Hazerswoude.

RATE AND MODE OF GROWTH OF BANANA LEAVES. The 27th number of the Botanisches Centralblatt contains a paper on this subject contributed by Mr. Walter Maxwell, Director, Hawaiian Experiment Station, Honolulu. The writers says that :-"The Banana appears to have only one centre of growth and elaboration; it makes only one leaf at a time, and practically completes one leaf before it begins with the next. Many other trees are producing scores of leaves at the same time, showing that centres of growth are distributed over the tree's complete organism. Moreover, the full-grown leaves of the Banana are soon frayed out with the wind and rendered useless for work, which leaves the work of assimilation to the new leaves. The young leaf begins slowly, daily increasing its rate of increase up to the stage of its maximum power of growth, where it tarries for two or more days, until the leaf, which hitherto has been almost as tightly rolled up as a cigar, begins to unfold to the light, when the rate of growth falls off till it is full grown. One other striking truth set forth by the daily data of development is the difference between the growths of the "day" and "night" periods. The observations were continued upon the leaves not only to compare the results of the day and night growths, but also to note the results of variations of temperature. . . . I am of opinion that the action of direct sunlight, and the direction and force of the wind, are more potent factors in increasing or arresting growth than small variations of temperature. On this subject I have, at present, no conclusive data."

MRS. DELANY'S FLOWER DRAWINGS .- With reference to this subject, we print the following very interesting communication from a valued correspondent :-

"In the Gard, Chronich of the 8th, I see mentioned Ludy Leanuver's bequest to the British Museum of the flower "drawings" by Mrs. Deland. These flower drawings, unless I am much mistaken, are cut out in paper—not drawn. It was a curious, old-fushioned art, in which Mrs. DELANY excelled. I remember a specimen of her work which my mother carefully preserved among her family treasures. It was a spray of a small pink Germium (I feel certain Mrs. Delany never said "Telargonium (") skilfully gunnied upon half a sheet of black paper. This one specimen might very likely have been truced back to Luly LEANOVER, who in all probability gave it to her friend, my mother's mother. Whether it is as I believe, or not, the collection now come into possession of the British Museum must be one of very great int.rest.—E. V. B."

PERIODICITY IN WEATHER.—Mr. H. C. RUSSELL has contributed to the Royal Society of New South Wales a paper, an abstract of which is given in a recent number of Nature. The writer brings forward historic evidence to prove that a cycle of nineteen years does exist, and that it was known to the ancient Egyptians, Jews, and other peoples. In New South Wales the great and conspicuous droughts recur once in nineteen years. Elijah's drought, it is calculated, happened in B.c. 908, that is, 2736 years before the great drought of 1828, and the interval is 19 x 144. The cycle is said to be regulated by the relative position of sun, moon, and earth.

DISEASED MELONS.-We have now examined a diseased Melon which was sent to us by "A. R.," on the supposition that the disease might be related to the Bacteriosis alluded to at p. 199. Our correspoudent says, "I planted ten Melon-plants in a pit heated with hot-water pipes, and have not obtained a single fruit fit for the table. The plants grew away well, and nothing seemed amiss with them until three weeks ago, when I noticed a fruit with a little speck on it, like fungus; that fruit was soon useless, and very shortly almost every fruit in the pit was more or less affected." This disease is an old one, and, hitherto, has only been found on the fruit. There are two separate species of fungi which appear to work in unison, and both are present on the Melon sent. First in appearance is Gheosporium lagenarium, the sporules of which burst through the cuticle, and are about 16 - 5 micro-millemetres in size, or less, and they coze out in dense masses, the size of a pin's head. Later on, the spots are an iuch in diameter, covered with a whitish floccose mould, amidst which lumps of flesh-coloured or pinkish substance of a denser consistency, and as large as a split-

pea, are imbedded. These, as well as the white mould, are made up of the threads and spores (or conidia) of a mould, Fusarium reticulatum: loug, curved, fusiform, three to five septate, and from 50 to 55 micro-millemètres long. What the relations are between these two kinds of fungi has not been determined, but they generally occur together, and both are equally destructive. In this instance, we have to encounter a pest which is well established in the tissues before it makes an external appearance, and then all hopes of saving the fruit or the plants is gone. When it once enters a Melon pit it may reasonably be expected to spread to all of the plants, because all the spores are capable of speedy germination. Our only recommendation is to burn up all the diseased plants and fruits, and disinfect the soil and the pits. M. C. C.

PRESENTATION TO MR. H. W. WARD .- Mr. WARD, who is leaving Longford Castle Gardens on the 9th prox., was the recipient on Monday last of a handsome writing cabinet, this being given by the garden men and a few other friends as a token of the good feeling which had so long existed between them and himself. The presentation was made by the foreman (Mr. F. Rowe) in the bothy sittingroom, in the presence of several of the subscribers.

STREPTOCARPUS AT WOODHATCH LODGE.—In reference to "D.'s" note on p. 221, on the Streptocarpus at Woodhatch Lodge, Mr. C. J. Salter desires it to be made known that the greater portion of the high-coloured varieties are from seed obtained from Messrs. JAS. VEITCH & Sons, not from seed saved by himself.

CAUTION TO GROWERS AND EXHIBITORS OF VEGETABLES .-- Mr. E. BECKETT, Aldenham House Gardens, Elstree, furnishes the following account of a theft perpetrated in his garden :- "During the night of the 24th inst, these gardens were visited by thieves, who carefully searched the Onion-bed, and took away the best bulbs of Ailsa Craig, the largest of which measured 18 inches in circumference, and the smallest 17 inches. There is no doubt in my mind that these bulbs are required for exhibition purposes, and whoever took them must be an expert in selecting; and he was also very cautious in replacing the soil whence the bulbs were taken, and taking the whole of the leaves along with them. The footprints of the thief were easily visible; the shoes had been removed, the marks of the stockings being quite plain, as it had rained heavily during the evening. I hope this may be a caution to others having choice vegetables, and I shall be obliged for any information that will be likely to lead to a conviction."

M. CARRIERE.—We learn with great sympathy and regret, of the death, on the 18th inst., of this distinguished horticulturist, long attached to the gardens of the Paris Museum, and a prolific writer on horticultural and botanical subjects. For many years he was editor of the Revue Horticale, and of late years has been associated with M. AndRE in the management of the editorial department of that journal. M. CARRIERE is well known as the author of a Traite Général des Coniferes, which reached a second edition; and of numerous publications on the variation of plants, in which he showed great perspicacity, and may be said to have been an evolutionist long before the word came into general employ. He was one of the most far-seeing and thoughtful of French horticulturists. He died at Montreuil at the age of seventy-

BULBS FOR THE ROYAL PARKS. - Her Majesty's First Commissioner of Public Works has, for the eighth time, entrusted Messrs. James Carter & Co., of High Holborn, London, with an order to supply the whole of the Hyacinths, Tulips, Narcissus, and other bulbs required for the Royal parks and gardens of London and the suburbs.

PLANT PORTRAITS.

ASPIDIUM GOI DIEANUM, Hooker, Machans' Moothin, July CHERRY EMPLROR FRANCIS, Bulletin d'Arboricolture, &c.,

CLIVEIA PRINCE ALBERT, Illustration Horticole, July 30. Flower segments broadly ovate, red, with a broad central whitish stripe.

Exogonium Purga, Garden, August 1.

HARDENBERGIA MONOPHYLLA, Revue d'Horticulture Belge,

LELIO-CATTLEYA ANDREANA, Revue Horticole, July 16.

LELIG-CATILETA ANDREANA, Reque Horticole, 3019 10.

NARCISSUS TRIANDRUS, Gueden, August 1.

NYMPHEA ANDREANA, N. ROBINSONIANA, hardy Water Lilies raised by M. Latour-Marliac, with reddish or crimson petals surrounding the yellow stamens. The flowers remain open furing the day for a longer time than usual. These hardy Water Lilies are most desirable. Revue Horticole, went of the surrounding the day for a longer time than usual. Angust 1.

Pueraria Thunrergiana, Benth., Garten Flora, t. 1429, hardy climber; leaves like those of a Scarlet runner; flowers Pea-shaped, reddish-violet, in long racemes. Japan.

STENOMESSON INCARNATUM, Garden, July 25. VIBURNUM CASSINOIDES, Garden and Forest, July 29.

PLANT NOTE.

AZOLLA FILICULOIDES.

This exquisite floating aquatic is now in great luxuriance here, and is again abundantly fertile, a condition it does not always attain in British gardens. Our plants occupy the whole of a small tank in a little open-air rockery, the water being partially shaded, and to some extent stagnant. while it is enriched every winter by an abundance of fallen leaves. This state of things seems to suit Azolla to perfection; but even nnder these toward conditions, I note that fruit, or spærocarps, are only produced in warm seasons, after a mild winter.

I shall be glad to supply fertile specimens to any botanical garden or public institution where they might prove useful for teaching purposes, on receipt of stamped and addressed post-parcel label. P. IV. Burbidge, Botanical Gardens, Dublin.

TAKING THE CROWN BUDS OF CHRYSANTHEMUMS.

"TAKING" the buds of Chrysanthemnms is a phrase well understood by cultivators who are exhibitors, but to the uninitiated it is one that is calculated to mislead. To the latter it really means taking away or removing the buds entirely, whereas to Chrysanthemum cultivators it is the retaining of the particular bud which is supposed to produce the finest of bloom, and the removing of the others. How the term "taking the buds" originated I am nuable to say; suffice it to know that it has been in existence for a very long period of time-certainly more than twentyfive years. In the Liverpool district, it was a common term, employed at that distance of time, and was then, as now, generally understood to mean "taking in charge" of certain buds that were, and are still supposed to give, the best results from the exhibitor's point of view. So much, then, for the technical meaning of the phrase. By botanists it is, I believe, regarded as a quite wrong expression; however, it is well understood amongst growers of Chrysanthemums.

If there is one detail in the cultivation of this popular flower that is of more importance than another, it is the "taking" of the buds; and with a view to instruct such readers of the Gardeners' Chronicle as are not as yet conversant with the important detail of bud-taking or selection, the Editor, with his customary wish to enlighten beginners, has had the accompanying illustration (fig. 49) prepared, with a view to making clear the various operations. Notwithstanding this undoubted aid to the verbal explanations, experience of the behaviour of the varieties must of necessity be obtained before proficiency is assured. If the huds are not formed at the right stage or time for individual varieties, it is useless to expect superior flowers. It is not on any particular day of the mouth that all buds should be 'taken." but the state of each plant has to be considered when the wished-for bud appears. In the Japanese section, where so many diversities in form and of colour, and the time required for the development of a flower have to be taken into consideration, it is essential, so as to have all the varieties in perfection at a given date, to afford a much wider margin as regards the date of the operation than is called for in the incurved section, where there is more sameness and uniformity in all points save that of colour.

As a general rule, it may be said that what is known as the crewn-bud is the one selected for producing a large bloom. Still, in Chrysanthemums there are two sorts of large blooms. Some cultivaters aim at producing flowers up to 1 foot in diameter, irrespective of the depth or solidity of such blooms. New, specimens such as these are usually lacking in the essential points that ge a long way teward perfection in a Chrysanthemum. My ideal of a fine blossem is one that is large in diameter.

As a general rule, those plants which are grown in what is termed the "large bloom" style, show three bods during the season of growth. One is known as the first break, which occurs from the middle of April to the middle of June; the second, or crown bud, usually forming in August, and if the cultural methods followed are the proper ones, this bud should give the best bloom. What is known as the terminal bud, forms later, generally in September. An engraving of this one will shortly appear in these pages. All these breaks are caused by the natural tendency of the plant to blossom. The three-break system of

Fig. 49.—Chrysanthemum crown bud. (See p. 248.

yet has sufficient depth to give a pleasing form, and has sufficient number of florets to give fulness. Take, for example, a specimen of Madame Carnot, 9 inches in diameter, and 6 inches deep, the florets bread and of that peculiar richness characteristic of this variety when seen in perfection. Contrast this with one fully 2 inches wider, half the depth, and censisting of narrow florets seriated at the points with that peculiar crect appearance neticeable in bleoms which have resulted from a too-early bud formation. There can be no two opinions as to which bloom is the best. In the latter example experience will quickly enable the cultivator to see that he has made a mistake, and to profit by the knowledge gained.

eultivation is the result of allowing the plants to grow away uninterruptedly from the eutting stage. With the inclusion new-a-days of so much variety in habit of growth and form of flower in the Japanese section, the result of crossing and intercrossing with a view to obtaining a dwarfer habit of growth and at the same time maintain robustness and high-class flowers, it is found necessary to resort to what may be termed a peculiarly artificial method of culture.

Some varieties of the Japanese section, then, would not produce desirable flowers under what I may term the natural three-break growth; and the plants are pinched at various times, so as to hasten or retard

growth and the formation of the flower-bads. To illustrate my meaning, take, for example, Mrs. Falconer Jameson, or Mdlle. Therese Rey. The former, if allowed to grow naturally, would produce from the ordinary erewn or second break-buds, blooms with but a few florets, utterly useless for showing, and in the general run they would be too late for any but the latest of the exhibitions; but by pinching the point out of the shoot, or main stem, about the middle of the month of April, a crown bud forms about the middle of August, enabling the bloom from this bud to develop at the right time for an exhibition held in the first or second week of Nevember. In this case, then, but one bud forms on the top of the plant. In the case of Mdlle. Thérese Rey, if a plant be pinched fully a month earlier, two buds will form during its season of growth, and the second or later one should be secured to give the desired fine bloom. I mention these two instances to show how much depends upon circumstances, upon observation, and on locality, before any cultivator can hope to attain to anything nearing perfection. Many varieties will give the necessary satisfactory results by what is termed ordinary natural treatment. Take for example that charming veilow-flowered variety Phœbus, or the newer Edith Tabor, of the same colour. Assuming the plants were propagated at the usual time-December, and satisfactorily managed afterwards, no trouble will be experienced in obtaining the best results from ordinary crown buds. Any system of culture, however, is easily rendered useless in its results if carelessness in attending to the requirements of the plants is permitted during the summer months; and under such conditions it is not fair to condemn any given method of culture Speaking generally, the best flowers in the incurved section are easily obtained by ordinary crown-bud selection. In any section, if the crown-bud forms too early, the flowers are coarse in the petals, and oftener reflexed than incurved in the case of ineurved varieties. The varieties emanating from Queen of England are more liable to this defect than any others. Such flowers are loose and flabby, and more like inverted saucers than the globes they ought to be. They cover more than enough space, but they have no depth and no solidity--the essential points in a good flower. In the incurved and the Japanese seetions, too, the depth of colouring is materially affected by the selection of the buds, and ne variety shows this so much as Etoile de Lyon, a variety that has fallen into neglect through blooms being exhibited by persons who do not understand the peculiarities of its culture. If buds of this variety are taken in the first week in August the blooms will be almost white when they develop, whereas the correct colour is rosypurple, and which would come, if the buds were formed in the third week in August instead of the first. The bulk of the Japanese varieties require a longer period to develop from the bud to the flowering stage than the incurveds, and due consideration should be given to this point. For instance, buds taken on the 10th of August will not be fully in flower so soon as some of the incurveds taken quite three weeks or a month later. "Taking" the buds is a simple matter, yet it is one that requires much care.

The engraving (fig. 49) represents a crown bud of Princess of Wales just formed. The growth shoots clustering around it should be cut off, as denoted by the dotted lines across the shoots, and any other branches forming below those indicated must also be removed. When the growths are removed the whole energy of the plant is concentrated in the flower-bud that remains. As a safeguard against accident in the manipulation of the buds and shoots, some growers retain one shoot at the point for a time, i.e., until it is seen that the bud is safely swelling to a good size. This I think is wrong, and quite unnecessary, as the energies of the plant are then divided between the bud and the shoot retained, and the latter must to some extent rob the flower-bud of its due amount of nutriment. If care be used in removing surplus shoots, no injury need be apprehended. The bett ime for "taking" the buds is in the early morning, or in the evening when the dew is upon the plants. The shoots at that time are quite brittle; and if the

stem be held securely in the left hand, and the young growths which are to be removed be bent suddeuly down one at a time, they will suap off. After a little practice, this method of removing superfluons shoots will be found more expeditious than entting them with a knife; but if the operation is effected during the middle of the day, when the air is hot and dry, and the shoots tough, the risk of damaging the flower buds is greatly increased.

From this time onwards, all buds, as fast as they form, ought to be "taken," irrespective of variety, presuming, of course, that large blooms are required, whether for exhibition or home - decoration. E. Molyneux,

SOCIETIES.

EASTBOURNE HORTICULTURAL.

Accust 19.—The grounds of Compton Place were again placed at the disposal of the Eastbourne Flower Show Committee, by his Grace the Duke of Devonshire, and a fairly good show was made there. We have, however, seen better competition at this show, the chief falling off being in the classes for stove and greenhouse plants.

Mr. T. Portnell, gr. to Sir A. LAMB, Bart., Battle, won for eight stove and greenhouse plants; Mr. J. WARREN, gr., Handeross Park, Crawley, following.

WARREN beat Mr. T. PORTNELL for eight exotic Ferus, his Alsophila australis and A. excelsa being very good. Mr. T. Tugwell, gr. to Miss Swift, Beechwood, was 1st for six exotic Ferns; Mr. J. Warren following very closely.

For eight ornamental foliage plants, Mr. J. Warren was well in front, his best plants being Croton angustifolius, C. Queen Victoria, and C. Williamsii. Phoenix tennis was also Mr. T. PORTNELL was 2nd here, Mr. J. WARREN WOR again in a class for six plants, a grand plant of Anthurium Waroequeanum being included.

Ericas were by no means so good as usual, but a nice plant of Erica Kingtonensis [?] came from Mr. WARREN, with his

1st prize exhibit of four plants.

Cut Roses were good, seeing the prolonged drought there has been in this district. Mr. T. Durrant Young, Eastbourne, was 1st for thirty six varieties, the best of which were Emil Hausburgh, Duke of Teck, Anna Olivier, Glory of Cheshant, and Grand Mogul; A. Slaughter, Esq., Jarvis Villa, Steyning, was 2nd.

A good box of blooms of Mrs. John Laing won, for Mr. T. D. Young, in a class for twelve of any one variety

Mr. Norcutt, St. Leonards-on-Sea, was let for table decorations, but the arrangement was distressingly heavy. Fruit.-Mr. Wallts, Fairfield Court, won for cooking

Apples; and Mr. H. NORMAN, Old Town, for dessert Apples A splendid dish of Figs came from the Rev. F. C. Harvey, Hailsham; and good Morello Cherries from Mr. Warren, Handeross. Mr. W. Gower, gr. to J. Lawrence, Esq., of Battle, had the best scarlet-fleshed Melon in Beauty of Bith. Mr. T. Tugwell, gr. to Miss Swiff, Beechwood, was 1st for a dish of Peaches, for a dish of Nectarines, for three bruches of black Grapes, and for a collection of fruit.

There were a number of non-competitive exhibits, the most noteworthy coming from Messrs. G. F. Scott & Co., East bourne; Messrs, Cheal & Sons, Crawley; Messrs, Laing & Sons, Forest Hill; and Mr. J. Charlton, Tumbridge Wells.

DEVON AND EXETER HORTICUL-TURAL.

August 21. - This old and vigorous Society holds two exhibitions in the year, one in the summer, and the other in late autumn, the exhibition just held being the 183rd. The promise of a wet day for this event is taken philosophically by the members, for it nearly always rains on flower-show day at Exeter, and there was no exception on this occasion. There was, unfortunately, a counter attraction, which took many of the Society's patrons away. This was a great gardenparty, given by Sir William Walbonn to celebrate the coming of age of his eldest son. As an exhibition, it may fairly be pronounced a success. There were 750 entries, representing ninety exhibitors, nearly all coming from Devonshire and Somersetshire. The arrangements were, as usual, well carried out by Mr. G. D. Cann, the Hon. Secretary, and a strong committee. Under the auspices of the Devon an I Exefer Auxiliary of the Gardeners' Royal Benevolent Institution, a fruit and flower stall was creeted in one of the tents, and was superintended by Madame Bryce, of Bystock, wife of the High Sheriff of Devon, assisted by a number of her hely friends, the result of their efforts being an addition of about £16 to the funds of the Auxiliary.

Open Classes and Groups. In the open classes, Mesers, JARMAN, & Co., Chard, won for Dahlias, with a good collection of forty-eight blooms, but there was no competition; and for forty eight Gladioli, Mr. F. H. Fox, Wellington,

For a miscell arous group of plants arranged for effect in

an oval space measuring 12 feet by 16 feet, there were but two competitors—Mr. W. Brock, Exeter (gr., Mr. Rowland), and Mrs. A. D. Sim Knowle (gr., Mr. Williams).

Mr. Brock was 1st, his group being less garish in colour, and the effect more harmonious. The 2nd prize group was and the enert more narmonnous. The Eng prize group was good, but in general too light in colour, and had not enough dark foliage-plants to relieve the brighter bues used in it. The 1st prize group consisted of Cannas, Adiantums, Montbretias, Tuberoses, Hyacinthus candicans, Celosias, Campanula pyramidalis, Lihum speciosum rubrum, Lobelia cardinalis Queen Victoria, Francoa ramosa, Bambusa Metake, Cattleya labiata, and fringed with Panicum variegatum and crowned with Cocos plumosa. Mr. BROCK was 1st also for a similar group confined to subscribers, winning the two silver cups.

For the smaller group, 12 ft $\times 8$ ft., Mr. Meek Farrant (gr. Mr. Protheroe) was 1st, and Mrs. W. F. Richards (gr. Mr. Bawden) was 2nd.

In the open class for twelve blooms of Tea Roses, Messrs, JARMAN & Co., Chard, were 1st, Mr. J. JERMAN, Excter, 2nd.

Plants.-In the class of twelve Stove and Greenhouse Plants,—in the cases of twelve stave and Greenhouse Plants, six in flower, and six foliage, distinct, Mr. Brock won the cup with a very fine lot. The best of them were Stephanotis floribunda, Croton Audreanus, C. Disraeli, Cycas revoluta, Kentia Fosteriana, Areca lutescens, and Cycas revoluta, Kentia Fosteriana, Areca lutescens, and Clerodendron Balfouriana. The same exhibitor was 1st in the class for six Stove or Greenhouse Plants in flower, with Dipladenia amabilis, Ixora princeps, Allamanda Hendersonii, Clerodendron Balfouriana, and Stephanetis floribunda. In his exhibit of three flowering and three plants he was also 1st, there being a grand plant of Creton Johannis in his group.

For six Stove and Greenhouse Ferns, Mr. Brock carried off

premier honours with magnificent plants, including Dicksonia antarctica, D. squarrosa, Adiantum Farleyense, and A. poly-

phyllum.

For six Gloxinias, Mrs. A. D. Sim was 1st, with a first-rate lot of plants, embracing the new colours which are so telling. The 1st prize for six dou de-flowered tuberous-rooted Begonias was well won by an amateur, Mr. F. KNEEL, of the City Waterworks, Exeter.
In the class for six zonal Pelargoniums, single-tlowered (in

9-in. pots , and six double-flowered, Mr. MARK FARRANT wen with better plants than have been seen for many years past at Exeter Show. They reminded one of the glories of the Pelargonium competitions of the past when the flower was in popular favour.

Cut Flowers,-In the cut flower classes there was no extraordinary feature excepting in herbaceous plants and annuals, and in these two classes, Mrs. MACALISTUR, Eampton (gr., Mr. James won with splendid collections, the Rev. J. L. Guess, Clyst St. George (gr., Mr. Gibbings) being a good 2nd in the annual, and Mr. Theorithus Knarmany in the herbaceous . In Mrs. Macalister's perennials, Cimicifuga, Lobelia fulgeos Queen Victoria, Harpalium rigicollection. dum, and Echinacea purpurea, were very fine.

Fruit -For the collection of fruit (10 dishes) Mr. VINCENT TUCKEY, Langport (gr., Mr. J. Lloyd) was 1st with Williams' Bon Chrétien Pears, Pine Apple Necturine, Noblesse Peach, Morello Cherry, Branswick Figs, Madresfield Court and Muscat of Alexandria Grupes, Lady Sudeley Apple, Jefferson Plum, and a Melon, Hero of Lockinge & Longleat Perfection, Mr. J. Brutton, Yeovil, was 2nd. In the collection of six dishes, Sir Massey Lores, Mariston (gr. Mr. Thos, Richards) was Ist with an admirable lot of fruit, consisting of Late Admirable Peach, Pine Apple Necturine, Museat of Alexandria Grapes good), Brown Turkey Fig, Golden Perfection Melon, and Transparent Gage Plum. Grapes were rather poor, entries few, and competition weak, excepting, perhaps, the Museats from Maristowe shown in the collection of fruit, the Gros-Maroc of Sir John Shelley, and the Buckland Sweetwater of Mr. G. P. Benmore.

In the single dish of Apricots, Mr. W. C. CLEAVE, The Sanctuary (gr. Mr. F. Wyatt), was 1st with Moorpark; Sports-woode, Honiton (gr., Mr. A. Hales), was 1st for a Scarlet-fleshed Melon with Sutton's Scarlet, and for a white fleshed with Davenham, both good sorts of Melons.

Figs were well shown, Mr. T. TURNER, Cullompton (gr.,

Mr. Isaacs), being ist with Brown Turkey.
Sir Reiners, Bounes (gr., Mr. Bull), as usual was

1st for Pine-Apples with a very fine fruit Vegetables are always exhibited largely at this show, and

a marked improvement in quality has been noticeable for some years past. The 1st prize collection that of Sir Jons Sheller's, Shobrooke (gr., Mr. Mars) was worthy of all praise, and it is a question if a collection of so high a level of praise, and less a question in a counterfor or so light a level of excellence has ever been seen at this show. The kinds shown were Renton's Monarch Leek, Veitch's New Intermediate Carrot, Cranston's Excelsion Union, Veitch's Autumn Giant Cauliflower, Dobbie's Invincible White Celery, Bardney Giant Runners, Veitch's Western Wonder Cucumber, Duke of Albany Pea, Pertection Tomato, Snowball Turnip, Vertel's Exhibition Brussels Sprout, Salisfaction Potato, Truly a wonderfully fine collection. Mr. W. E. S. Erler

DRAX, Sherborne (gr., Mr. Copp.), was a good second. In the single dish classes, the Rev. A. H. Cruwys, Cruwys Morchard (gr., Mr. T. Northcote), had an absolutely perfect dish of Veitch's Model Carrot, and Mr. T. Kekhwich, Peanore (gr., Mr. Abrams), had a fine bunch of Renton's Monarch

Sir John Shelling's Excelsion Onions were a grand lot as were his New Intermediate Carrots in the single dishes as well as in the collection

The prize for Turnips was taken by the Hon Lady WALEPAD, Sprydoncote (gr. Mr. Stark), with Veitch's Red Garden Globe; the winning Tomato being Cannell's King (Perfection type); Celery, Jarman's Prize Pink; Scarlet Runners, Hill's Prize; Beet, Dobbie's Selected; Shallot, About these Shallots much doubt was ex-Jersey Wonder, pressed as to whether they were Shallots or Onions. It seems they were raised from seed and not from bulbs. They were of extraordinary size, but very pale.

Potatoes were keenly contested, the winning varieties being Round White, Bryant's Seedling; Round Coloured, Perfection; White Kidney, Satisfaction, Mr. W. E. S. EBLE DRAN'S six sorts (1st Prize) were Supreme, Satisfaction, Seedling, Mr. Breese, Perfectioo, and Mottled Beauty. Mr. W. C. Cleave took 1st for Cucumbers with Sutton's Peerless, and Miss Freep, Teignmouth (gr. Mr Stiles) 1st for Peas with Duke of Albany. Taken as a whole, the vegetables were a grand show

Perhaps the prettiest feature of thes how was the dinnertable competition, arranged with flowers and fruit on a table 8 × 4 feet. Miss Kingdon, of Taddyforde, Exeter, was 1st for an artistic production in which pale blush was the pre-vailing colour. Small pink Begonias, Gyrsophila paniculata. Small pink Begonias, Gypsophila paniculata, and the fluffy inflorescence of Rhus Cotinus were used with fine effect, the result being a perfect harmony of colour. Mrs. Drayton, Exmouth, was a good 2nd, but there was too much orange colour in her arrangement.

ROYAL HORTICULTURAL OF ABERDEEN.

August 21, 22.—The annual show was held in the grounds of Gordon's College, Aberdeen, in very favourable weather. For the past few years the directors of the society have been endeavouring to popularise the annual show, and they have succeeded. Occasionally the complaint was heard that there were too much fireworks and too little horticulture at the society's exhibitions, but this was not the case on Friday and Saturday last; indeed, experts pronounced the show to be the finest held in Abordeen for a number of years. The entries numbered 2.038.

Pot Plants. - The interior of the marquee in which these were shown was a particularly attractive one. On entering, the visitor was at once attracted to the groups of plants arranged for effect in circles of 10 feet diameter. Mr. A. GRIGOR, Fairfield, was 1st; Mr. A. REID, Durris, 2nd; and Mr. J. Proctor, Devanha House, 3rd. The stove and green-house plants exhibited by gardeners were a grand show, and in regard to the Ferns, more beautiful specimens were never seen at any of the past shows of the society. prize-winners were Messrs. J. Proctor, Devanha House; J. McDonald, Balgownie; A. Middleron, Waferton House; Alexander Robb, Glenburnie Park; W. Ogo, Morker; A. GRIGOR, Fairfield; and R. Kilon, Woodlands, Cults.

Cet Flowers, &c.—The marquee in which these were disayed attracted large crowds. The professional gardeners played attracted large crowds. came to the front here in fine style. The display of Gladiolus was magnificent. In the nurserymen's contest for Roses, the rosarians, Messrs. J. Cocker & Son, who during the past few weeks have been giving an excellent account of themselves at the shows in the south, had to give way to Messrs. Adam & Craigmyle, Aberdeen, and Messrs. D. & W. Croll, Dundee. The chief prize-takers among the professional gardeners were Messrs. George McLennan, Fetteresso; WILLIAM COUTTS, Ellon; A. REID, Durris; JOHN WILSON, Montrose: WM. Ogg. Morken: William Hurchi on. Balmedie : A. Middleton, Waterton House; and J. McDonald, Balgownie Lodge.

Fruit. The display in this section was an excellent one, and one which was very creditable to the exhibitors. honours of this section lay with Messrs. G. Duncan, Letham Grange; J. Paterson, Rubislaw; A. Howre, Drumtochty; G. Taylor, Raeden; A. Hutton, Usam House, Montrose; A. Reid, Durris; A. Middleton, Waterton House; T. B. Middleton, Monymusk House; James Grant, Rothienorman : W. Sim, Murtle ; and J. Brown, Delgatty Castle.

Vegetables - In this section the distinction between amateur and professional gardeners' exhibits was most marked. The collections were the most attractive features, and in giving the awards in the professional class the judges had a difficult task to perform. Mr. ALEXANDER PATERSON, Rubislaw, had the premier place, and was followed by Mr. J. Paterson, Rubislaw; and John Smith, Mannsfield. The gentlemen's gardeners had entries of quite as high degree of merit, the awards in their case being: Mr. J. B. MIDDLETON, Monymusk House; Mr. G. Milne, Cluny Castle; and Mr. J. Wilson, Charleton, Montrose. There was an uncommonly fine display of Potatos. The principal prize-takers in the various sections were Messrs. W. Harper, Perth: A. Med-PLETON; JOHN MILNE, Ruthrieston; A. Howie, Drumtochty; J. EDDIE, Freefield; and John Paterson, Craigmyle,

The amateurs and cottagers alike gave a good account of themselves, the display of greenhouse plants, window-grown plants, cut flowers, fruit, and vegetables being highly plants, cut flowers, fruit creditable to the exhibitors.

In the exhibition tent for nurserymen, Messes, W. Smith & Son, Aberdeen, and Messrs, Cocker & Sons had most attrac tive displays, The first named firm had an extensive and elaborate exhibit of care and choice pot plants, floral designs, and hardy herboreous and horder flowers. The Messrs. Course displayed a large quantity of herbaccous plants, numbering over 100 and Messrs, Ben. Reid & Co. exhibited a fine collection of plants and flowers, which made a creditable show. They also had stagings, each 30 feet long,

on which was arranged with fine effect a collection of foliage on which was arranged with the cheek a structure of sample plants, including Crotons, Caladiums, Dracenas, Palms, Smilax, Pandanus, Araucaria excelsa, Ferns, Acalyphas, &c., interspersed with flowering plants.

ROYAL HORTICULTURAL.

AUGUST 25 .- An ordinary fortnightly meeting was held on Tuesday last, in the Drill Hall, James Street, Westminster. Again the hall was very well filled with exhibits and though the attendance may be described as poor, the display made was an exceedingly good one. Orchids were again fewer than usual, and the attendance of the members upon that committee was likewise very deficient. But hardy flowers were largely shown, and the meeting was remarkable for two extensive and exceedingly interesting collections of Aster blooms. It was, however, in greater degree, due to the exhibits of fruit that the show was so much larger than was expected. Indeed, on no occasion this year has anything like the space that was necessary upon this occasion been occupied by fruit. Mention may also be made of an interesting exhibit of Nepenthes made by Messrs. Jas. VEITCH & SONS.

Floral Committee.

Present: W. Marshall, Esq., Chairman; and Messrs. Jno. Fraser, H. B. May, H. Herbst, Geo Nicholson, Geo. Stevens, James Hudson, J. F. McLeud, R. B. Lowe, C. J. Salter, R. M. Hogg, W. Bain, Chas. E. Pearson, and Chas. Jeffries.

Messrs, J. Laine & Son, Forest Hill, London, S.E., showed some choice Caladiums and ornamental leaved Begonias. An Award of Merit was recommended to Caladium Donna Carmen Macedo, a pretty variety with dull rel leaves and green veinlug. Begonia Louise Closon Improved is an ornamental plant, with leaves of very dark velvety brown, and a pretty rosy-red. It is distinct and handsome (Award of Merit). Begonia alba magnifica, with large silver-coloured leaves, was also distinct and attractive.

T. W. Girillertonic, Esq., Sunningdale, Berks, showed several pretty seedling varieties of single-flovered Dahlits.

Begonia Captain Holford, a fibrous-rooted variety with single red flowers, was shown by Mr. A. CHARMAN, The

Gardens, Westonbir', Tetbury.

Mr. H. Becker, Jersey, exhibited a number of flowers of a variety of the Comet Aster, named Marguerite, from the semblance of the blooms to a white Marguerite. Mr. BECKER

also showed a giant type of the Jersey Lily.

Mr. W. Rumsey, Waltham Cross, received an Award of Merit for H.-P. Rose, Mrs. Rumsey, which has been frequently exhibited and described during the present season. It is a pretty-coloured flower, but rather thin. It is said to be a capital grower, and quite proof against mildew and some other pests.

Messrs. Dobble & Co., Rothesay and Orpington, exhibited blooms of three Cactus flowering Duhlias, Mrs. Peart, strawcoloured, Mrs. F. Fell, more white than the preceding, and Miss Webster, a seedling variety of pure white with just a

green shade from the centre. The blooms are large, and of fine form. It is a very good one (Award of Merit).

Mr. Thos. S. Ware, Hale Farm Nurseries, near Tottenham, staged a fine exhibit of out-of-door flowers, which included a good number of Dahlias, Lilium philippeuse, L. speciosum good number of Dahlias, Lilium philippense, L. speciosum rubrum, L. s. album, several species of Fritoma, Rudbeckia Neumanni, Echinacea purpurer, a striated form of Helenium grandicephalum, Eryagium Oliverianum, and a number of varieties of Heliantums—The Dahlias made a showy facing to this group (Silver Flora Medal).

Asters were capitally exhibited by Messrs. H. CANELL & Soys, Swalley Kent, who filled the wools of one side of the

Sons, Swanley, Kent, who filled the whole of one side of the hall with sprays of flowers, exhibited as Dahlias usually are. The blooms generally were remarkable by reason of their symmetry, excellence, and distinct colours. They were from open-field culture, and many f them were strains selected open-heid culture, and many I them were strains selected for the seventh time from plants cultivated in Kent. We cannot attempt to notice so large a number of varieties, but some remarks upon them will be found on p. 240. The Comet Aster in its different colours, The Emperor or Giant, The Victoria, and Peony-flowered, were the most attractive (Silver-gilt Flora Medal).

Messrs. Dorbie & Co., Rothesay, and at Orpington, Kent, made an exhibit of Asters, comprising a very large number of varieties. Some of the types most noticeable were the Pæony-flowered, height about 21 inches; the Victoria, 20 inches, a large-flowered, smooth-petalled section; the Giant Conet, 18 inches; Goliath, 24 inches; tall and dwarf Chrysanthemum - flowered, Imbricated Pompon, Globe-flowered German, and Quilled German; the Bull Aster, or Jewel; Dwart Pyramid Bouquet, Dwarf Victoria, and others

(Silver Flora Medal).
Messrs, R. Wallace & Co., Kilnfield Gardens, Colchester, made a fine exhibit of Liliums and Gladioli. The Lilies included L. speciosum Melpomene and L. s. macranthum, both exceedingly good varieties of the type, the former being intense in colour, the petals recurved greatly, and the latter larger in bloom and less recurved, being also of a good colour; L. tigrinum Fortunei giganteum, and other varieties of this species, L. aur tum rubro-vittat m, and others. Some excellent Gladioli were shown, including several strains of very choice description. Several plants of the beautiful white-flowered Watsonia iridifolia (figured in Gurdeners Chronicle, March 5, 1892, p. 305), were also exhibited. The spikes were nearly 4 feet high and much branched (Silver Banksian Medal).

Mr. Walters, Eastwell Park, Ashford, Kent, sent some Gloxinia blooms from plants raised from seeds sown on January 27 last. They were very fine

Messrs. Jno. Peed & Sons, Roupell Park Nurseries, Norwood Road, S.E., staged a collection of hardy flowers, including a large number of perennial herbiceous species, and a few of Dahlias (Silver Banksian Medal).

Messrs, Young & Dobinson, Stevenage Nurseries, Herts, had an exhibit of Pansy and Viola flowers, &c. (Bronze Banksian Medal).

Messrs, James Verreur & Sons, of the Royal Exotic Nursery, Chelsea, exhibited a collection of Nepenthes of consisterable extent and variety, and in mostly large examples. We remarked the fine hybrid N > Mastersiana [N. sanguinea and N. distillatoria), with short petioled, rich brown pitchers N. distillatorial, with short perioded, rich brown pitchers; N. Amesiana, a handsome, large pitcher of a green ground colour, with murbling of dark brown, and having large, distinct-looking wings, which are harry at the edges; the curious N. Veitchii, N. Dicksoniana, a cross of N. Veitchii and Rafflesiana; N. Witte, with a very slender pitcher must streaked with brown—a garden hybrid; N. Cineta, light brown pitcher; N. Wrigleyana, the extremely handenest N. Curtilli, and the stream of th Cineta, light brown pitcher; N. Wrigleyana, the extremely handsome N. Curtisii, green and dark brown in equal proportions; N. Hookeriuna, elegant oval shaped pitchers on longish petioles; N. Morganiæ, N. Mivta sanguinea, N. intermedia, N. hybrida maculata, N. Burkei, N. Rafflesiana, N. Formosa, the red variety of N. Mastersiana, and N. Northiana, one of the handsomest species. N. Dominy, which commemorates one of the carliest hybridity of the game, N. Chelskii, N. himsterdishers. bridists of the genus; N. Chelsoni, N. hirsuta-glabrescens, spherical, green-coloured ptehers, suspended by short petioles; the free, small, dark-brown pitchered N albomarginata, &c. The group was enlivened by a setting of Cocos plumosa, Adiantum, and Acer Negundo foliis variegata (Gold Medal).

Sir TREVOR LAWRENCE, Bact, Butford Lodge, Borking (gr., Mr. Ban), showed some beautiful large-flowered Pent-stemon hybrida grandiflora in many various colours. He also exhibited a number of spikes of M. Lemoine's hybrid Gladiolus in superh form — Especially meritorious were Colonel Cyllon, deep cerise-coloured flower, with a short white flame that is sparingly spotted with rise; Paul Marguerite, a large pale purple flower, white at the base of the upper segments, whilst the lower ones are dirk purple, forning a remarkable flower. Commodore Monteil, a flower of a light purple tint, with a redd-sh-purple throat; Rosa Bonheur, also of a shade of light purple, with a throat of dark purple, the upper part of whehms white; Humbert, a flower of crimson and gold, of medium size, and very showy; A las, a charming purphsh-pink flower, of an immense size, as is also the spike (Award of Merit): Fustell de Coulanges, a flower of a tint of earmine, with a white patch in the throat and a short spike, is a fine thing (Award of Merit); Lobelia Carmine Gem. a novelty of the L. cardinale type, of a desirable tint, valuable as a variety (Award of Merit).

E. H. JUNKINS, nurseryman, Hampton Hill, obtained an Award of Merit for Campanula "Profusion," a hybrid from C isophylla alba - C carpatica alba. The flowers are moderate in size, of a pretty test in pale blue, and are produced with much freedom.

Orchid Committee.

 $\textit{Present} \in \Pi \text{ arry } J.$ Veitch, Fsq , in the electr; and Messes Jis. O'Brien (II m. Sec.), S. Courtauld, A. H. Sniee, W. Cobb, H. J. Chapman, and H. M. Pollett.

The group staged by J. Genney Fowler, Est., Glebelands, South Woodford (gr., Mr. Divies), was specially interesting, on account of the variety and excellence of the plants of which it consisted. Among them were the fine Ledio-Cattleya > Fowlerii, the pretty Ledio-Cattleya > Aurora var. Vedisting some plants of Cattleya a great, C. Loddigesii, and C. Eldorach, one of which was a fine white form, the scarce and elegant searler Remarkera matatina, Cy noches chlorochilum; Ledio-Cattleya elegans; the rure and handsome Pachystoma Thomsoni. elegans; the rare and handsome Pachystoma Thomsoni, with several spikes of flowers; Catasetum Bungerothi, Olontoglossum tripudians, the singularly little Stambopea edecodus, a nice plant of Cypripedium Luwrenceanum Hyeanum, and other Cypripediums, Dendrobium Phalamopsis, &c. The group was awarded a Silver Flora Medal.

dec. The group was awarded a Silver Flora Medal.

Sir Thevor Luwresce, Bart., Burford, Porking (gr., Mr. W. H. White), staged several very interesting species. One plant of Eria stellata bore several spikes of pretty rose and white thowers; Epidendrum alatum and E. Fournierianum were well-bloomed, and Habenaria carnea and H. c. nivosa were so well grown as to secure a Cultural Commendation. There were also a bunch of cut flowers of Maxillaria fucata, a fine spike of Rhyneostylis r tusa, and good plants of Cyrripedium β curyandrum, C. \times Harrisianum superbum, and C. α -nanthum.

Three remarkable plants were sent by the Honble, Walter Rothschild, Tring Park, Tring (gc., Mr. E. Hill), viz., Cyenoches maculatum which bore a long racine of large creamy, white flowers spotted with purple, and with a singular white fringed labellum. Award of Ment): Bulbophyllum species from Borneo: a very extraordmary plant with fleshy ovate leaves, and very rudumentary pseudo-bulbs, borne on creeping rhizomes. The flowers which were highly polished were nearly equal in size to those of B. Lobbii; in colour a light yellow, with numerous fine purple lines. The singularboking labellum was prolonged in front to a long narrow tongue which, when it worked forward on its hinge, curved under the chin formed by the rounded bases of the lower sepals (Botanical Certificate); and Miltonia Schroderima major, which appeared a much stronger grower than the ordinary form, whilst its pure white and crimson labellum

the ordinary form, whilst its pure white and crimson libellium was also larger (Award of Merit).

Major Joneev, Sunningdale Park, Sunningdale (gr., Mr. F. J. Thorne), showed Miltonia candida grandificha, a fine variety, and splendidly grown bearing three strong spikes (Awarl of Merit); the pictry scarlet Leda monophylla, with unusually large flowers, one of the spikes bearing two blooms (Awarl of Merit). Standards Lovie are American with (Award of Merit), Stanhopea Lowi var, Amesiana, with large, wax-like, white, fragrant flowers; and the still larger white and purple S. churnea (Award of Merit); also Cattleya Le quiddi, a fine form of the large white Anguloa eburnea, a pretty plant of Olontoglossum aspiderhinum spikes, and a pretty Zygopetalim of the Warseewiczia section with white and rose flowers.

THOS STATTER, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson, sent Cypripedium × Excelsior (Rothschildi doun + Harrisianum), Lælio-Cattleya & Schiller-

(Roth-schildt anum - Harrisianum), Ledio-Cattleya & Semmer-ina, Statter's variety, and L.-C. & elegans Johnsoniana, all eveellent examples of their kind.

Messrs. Heon Low & Co., Clapton, staged an effective group, consisting of good specimens of Saccolabium coeleste, Ledio-Cattleya - Schillerman, L.-C. & elegans Turneri, and the still more beautiful L.-C. & elegans Wolstenholmie; a still more beautiful L.C. s. clegans Wolstenholmie; a number of well-flowered plants of Dendrobium formosum gig inteum and D. Phulanopsis Schroderianum, Cypripedium Chirlesworthi and other Cypripediums, Cycnoches chloro-chilum, Catasetum callosum, with singular chocolate and green insect-like flowers (Botanical Certificate), and some good specimens of Miltonia spectabilis Morelium. The group

good specimens of Miltonia spectabilis Morelium. The group was awarded a Silver Banksian Medal.

T. B. Haywoot, Esq., Woodhatch Lodge, Reigate (2r., Mr. Silter), sent Coelogyne Micholitzii, a fine species, with a general resemblance to C. speciesa; flowers white, with nearly black block on the lip (Award of Merit).

Redisalle Young, Esq., Fringilla, Linnet Lane, Sefton Park, Liverpool (gr., Mr. Poyntz), sent Cypapedium × Ashburtoniae expansion, Cookson's variety, and C. × Atropos, a byland abrained between it and C. purpuratum. It was a

a hybrid obtained between it and C. purpuratum. It was a small flower, but of good shape, and very richly coloured.

W. Thomeson, Esq., Walton Grange, Stone, Staffordshire, exhibited a noble plant of Dendrobium longicornu covered

with its pretty white, orange-hpped flowers (\text{ward of Merit)}; a grand plant of Leho Cattleya \times elegans Cawenbergiana with two spikes (Cultural Commendation); and Odontoglossum crispum Annie, a large and finely-blotched

Messrs B. S. Wittaxus & Son, Victoria and Paradise Nurries. Upper Holloway, showed a fine plant of the handsome Brassia brachinta.

Messes Jas Veitch & Son, Royal Exotic Nursery, King's Read, Chelsea, exhibited a fine example of Leho Cattleya x Clonia (C. Warseewicza z. L.-C. elegans), illustrated in the

Col. BRYMER, Hsington House, Borchester (gr., Mr. Col. BRYMER, Hsington House, Dorchester (gr., Mr. Powell), again showed his fine hybrid Liello-Cattleya - Brymeriana (L.C. Amanda 9, C. Warse ewiczii 6), on this occasion securing a First class Certificate for the plant, which is certainly a very handsome hybrid. The stout plant bore a five-flowered inflorescence of large rosy linc flowers, the labellum be satisfully nested with rich purplish crimson.

Messis. F. Sander & Co., St. Albans, showed Lelio-Cattley & Gottoian; and Mr. J. W. Moone, Bradford, an immature plant of Cymbidium. 9 aloifolium.

Fruit Committee.

Present: Philip Crowley, Esq., Chairman; and Messrs. T Francis Rivers, Henry G. Peirson, Geo. Bunyard, T. J. Saltmarsh, T. H. Crasp, Alex. Dean, J. Willard, J. W. Bates, Jno A. Lung, Jas. H. Veitch, F. Q. Lane, H. Balderson, G. Norman, and Robt. Fife.

Superb Grapes were shown by P. N. GRAHAM, Esq., Hurst Side, West Molesey, Surrey (gr., Mr. G. Elliott). There were six banches of M dresfield court, and six of Gros Maroe. In each case the bunches were heavy, the bernes large, and the tiros Maroe especially very righty coloured. One Vine of either kind produced the fruit shown (Silver Knightian Medal).

A collection of Peaches and Nectarines was shown by Mr Walters, gr. to Lord Genard, Eastwell Park, Ashtord, Kent. There were Humboldt, Elruge, Pine Apple, Melton, Galopin, Galoni, Stanwick Elruge, Rivers' Early Orange, and Prince of Wales Nectarines, and Gros Mignonne, Princess of Wales and Sea Eagle Peaches. This was a very mentorious exhibit (Bronze Knightian Me tal:

(Bronze Kingatian Me iai).

Three very large bunches of Muscat Hamburgh Grapes were shown by W. R. Cookson, Esq., Bracknell (gr., Mr. Thos. Dennis). They were well coloured, but there many small berries in the bunches (Bronze Kinghtran Medal).

An exhibit of Grapes, Peaches, Pears, and Plums was made from the Society's gardens at Chiswick, and cultural commendations a varde1 in several instances; Dodralabe (a black, almost round herry), Black Monnukka (stoneless), and others, not common in gardens, were noticed among the more ordinary varieties of orașes. The Plums, Peaches, and

Pears were of good quality also.

From the Royal Girdens, Windsor, Mr. O. Thomas exhibited fifty dishes of fruits, consisting of Peiches and Nectarines, and Plums. Some of the Peaches and Nectarines were unripe, but the Plums were very bus, and included about two dozen varieties (Silver-gilt Kunghtian Medal).

A large and very commendable collection of fruits to in the open was staged by Mr. Geo. Wythes, gr. to Earl Percy, Syon House, Brentford. This was composed of nity dishes, and included namy varieties of Penches, Nectarines, Phins. Apples, and Pears; also Apricots, Figs, Damsons, capital

Modello Cherries, Mulberries, &c. The collection was deservedly awarded a Silver Knighti in Medal.

An Awa d of Merit was recommended to Tomato Young's Eclipse, that received marks at Chiswick on July 31 last, and was described in *Gardeness Chemicle*, p. 162. Other Tomatos was described in Gautine's Chronicite, p. 102. Other romates shown were Abbey Wood, scarlet, and Abbey Wood, crimson, from Mr. J. Clark, Abbey Wood, Kent; and Osberton, scarlet, a large-fruited very free-cropping variety, from Mr. T. H. Crase, Osberton Gardens, Worksop.

There were six fruits of a scarlet-fleshed Melon named Improvement exhibited by C. T. Calley, Esq., Ivy Mount, Lagrum Court Royd, Stratham (gr., Mr. H. Poulton); and Mr. S. Colle, Swallowfield Park Gardens, Reading, showed fruits of a Melon named Swallowfield Park Favourite, but neither of the varieties possessed good flavour, though the latter was the more promising.

Mr. Wythes exhibited a smull scarlet-fleshed Melon from a cross between Hero of Isleworth and Syon House, but this

too was of poor flavour

Mc H. BECKER sent a dish of the Red Currant Comet, that received an Award of Merit on July 3. Mr. O. Thomas, The Royal Gurdens, Windsor, showed a yellow Plum named Windsor Early; and Messrs, Jas. Veitren & Soss, exhibited a Gage Plum named Webster's Gage, a very good flavoured froit.

Mr. ALEX FINDLAY, Maresfield Park Girdens, Uckfield, Sussex, showed half-a-dozen fruits of a Petch known as Maresfield Park Szedling, very dull red in colour, and probably of little value.

Messrs. R. Veitch & Son, Eveter, sent a few of their new Intermediate Carrots, which have a very fine appearance.

For the prizes for the best dishes of Apples and Pears there was far greater competition than previously. The 1st prize for Apples wis given to Worcester Pearmain, shown by Convine Brown, Esq., Hextable, Kent; and, Duchess COLVEL BROWN, Esq., Hextable, Kent; 2nd, Duchess Fixourite, from Earl Penev.

r ivourne, from nort i has v.
The lat prize for Pears was given to Benrié de l'Assomption, exhibited by Mr. G. Norman, gr. to the Marquis of Salisaury, Hitfield; 2nd, Williams' Bon Chrétien, from

SALISBURY, Hutheld; 2nd, Williams' Bon Chretien, from Larl Percy (gr., Mr. Wythes). C. J. Massay, Esq., Galloway House, Garliestown (gr., Mr. Day), exhibited a collection of hardy fruit, principally Plums, some of which were of very good quality, considering district in which they were grown (Bronze Knightian

Met(t) — Eight bunches of the Grape Ferdinand de Lesseps were shown by Mr. T. H. Chasp, gr., Osberton, Worksop—This is a Museat-coloured Grape, small in bunch and berry, and possesses a very remarkable flavour, pleasant, distinctive,

An expellent collection of fruit was staged by Messrs, Jas Vetto a & Soss, Royal Ecotic Nursery, Chelsea, including a large number of fine Plums from pyramidal trees. We noticed Early Transparent Gage, Kirke's Washington, Lawnotice 1 Early Transparent Gage, Kirke's Washington, Lawson's dolden Gage, Cov's Emperor, Oullin's Golden, Brandy Gage, and others of very tempting quality indeed. Of Pluns and Damsons there were forty two dishes. Apples and Pears, too, were exhibited well, many of the Apples being large and well coloured. Of these there were nearly fifty dishes. From the same establishment were exhibited also a few young Fig trees, against time fault. hibited also a few young Fig trees carrying ripe fruits. Brown Turkey, Negro Largo, Bourpassotte Grise, Osborn's Prolitic, White Misselles, and Bourjassotte Noir were the varieties silver gilt Knightian Medal).

Messrs, S. Stoonen & Sons, Houndow, exhibited forty dishes of fruit, composed for the most part of Apples and Pears, and there were four dishes of Plums also Bronze

Briksian Medab.

Messrs, Hurmson & Sons, Leicester, sent a collection of varieties of dwarf French Beans, representing about two dozen named varieties (Vote of Thanks).

Lecture.

FORCING LILY OF THE VALLEY.

Is the afternoon a lecture upon this subject by Mr. T. JANNOUH was read by Mr. J. WEATHERS (Assistint Secretary); Dr. M. T. MASTERS, F.R.S., in the chair. At the commemerment, Mr. Jansoch remarked that the practice of for ing Lily crowns was not an old one. Half a century ago the culture of crowns for such a purpose was confined to a sun dl area around Berlin and Hamburgh. In 1859 there was no nurseryman who grew a greater number of crowns than 60,000. Very little was said upon this or other such circumstances, however, for the paper was a practical one in the extreme, and it dealt almost evelusively with matters

The best soil for the purpose was said to be a light sandy loun, with a moderately dump subsoil. A cold thick clay with a moderatery dump was not against the growth of the crowns so much as a hindrance to the ripening process. The crowns upon such Land would be large and fleshy, but growth would continue tant would be large and nestly, but grown would continue too late, and the crowns, therefore, insufficiently ripened for some sessfully passing through early and hard foreing. The soil should be thoroughly well worked preparatory to planting, and some crumbling hot bed manure, if such can be had, mg, and some erimoning not see manner, a section might be worked in at the same time. Autumn was strongly recommended as the best time to effect the planting of the roots, and long exposure to the air should be avoided as noos, and rong exposure to the air should be avoided as much as possible. The crowns should be planted in trenches 5 inches deep, and 7 or 8 inches asunder, I inch dividing the crowns from each oth r in the rows. Frequent paths dividing the land into bods would be necessary to conveniently with the crown should be necessary to conveniently with the crown should promise require. emently water the ground should occasion require. The

tip of the crowns should be just level with the surface of the ground.

When the planting has been completed, a mulch ng might be given, and during the following season attention would be likely to be required to watering. Usually, a crown first blooms when it is three years old, or more accurately, three a half years old. By extra cultivation they might be made to bloom after the second year, but he had proved that when lifted at that age the percentage of flowering crowns

was not sufficiently good to make the practice advisable.

After they have bloomed, under ordinary culture the crowns will again flower each alternate year, but may be made to do so for several years in succession by extra cultivation. Not only so, but twice in a year, by allowing them to bloom in the beds naturally, and then lifting them in the summer for forcing in the autumn. The great point to achieve was to have the crowns thoroughly matured. They would not force successfully, unless they experience a short rest previously. The crowns might be potted up about the end of October or commencement of November. Twelve crowns should be put in a 5-inch pot, well packing the soil between the crowns as they are put in. Some of the large growers put the crowns in foreing-boxes, and less often crowns are packed together upon the stage, in a warm house, and put into boxes after they have made a little growth.

When potted up, cover the crowns lightly with some green moss. They should be put into a temperature of 80 Fahr., which may be increased to 90 during the first fortnight. should never be more than 110, nor lower than 80.

When the flower scapes appear, gradually expose them from the dirkness it is usual to start them in; and as soon as the lowermost bells open, the syringing of them should be discontinued After Christmas the process of forcing is much simplified. The blooms will come more freely, and particularly the foliage, therefore each will require rather more room.

When potting up the crowns, it should be remembered that it matters not what kind of sail is used. No roots are made during the process, and the quality of the flowers is not affected in the least degree by the material in which the crowns are forced. Of varieties, Mr. Jannoch said that especially for early forcing the Berlin variety was better than either the Dutch or Hamburg forms, and reference was made either the Dutch or Hamburg forms, and reference was made in Gwel. Cheon., fig. 76, p. 405, March 25, 1876, as showing the superiority of that type over the Dutch one. Mr. Jannoch referre i to the practice of retarding the crowns, but said that much had yet to be learned upon the matter.

BRIGHTON HORTICULTURAL.

AUGUST 25, 26. This was again held in the Dome and Corn Exchange, and was one of the best of a number of grand exhibitions held of late years under the new management, Groups, cut Dahlias, tables of plants, and front were especially good. In the vegetable section, too, the exhibits were of very satisfactory quality.

Groups. The society's Silver Med.d and £5 for a group of plants 18 by 10 feet was well contested. Mr. C. HOLLAND, nurseryman, Tunbridge Wells, winning with a grand arrangement of Crotons, Caladiums, Dracenas, Ferns, and Palms, ment of Crotons, Catanums, Dracenas, Ferms, and Falms, having a mirror in the background. Mr. H. J. Jones, Hither Green, Lewisham, was a capital 2nd.
A. Bronze Medal, and £3, offered for a smaller group, was won by Mr. J. Simins, gr. to C. J. Iswood, Esq., Dyke Road,

Brighton, for a light and pretty arrangement.

Groups of Ferns are always a feature here and Mr. J. Adams, gr. to the Rev. Sir G. Shiffner, Bart., Coombe Place, Lewes, again won with a well-arranged collection, including fine plants of Adiantum Farleyense; Mr. G. Malls, Dyke Road Nursery, was 2nd, his group being better in arrangement, but the plants were less good than those from his neut, but the plants were test from the followering and follower rival. Seven competed for a table of flowering and follower plants, Mr. C. Holland, nurseryman, Tunbridge Wells, being well in front of Mr. E. Lawrance, gr. to T. Ollavier, Esq., Tambridge, Horshitm.

Plants. For eight Stove and Greenhouse Plants, the comreceipts. For eight Stove and Greenhouse Franks, the competition for £1 and the Corporation Challenge Cup was very keen between J. Warren, Esq., Handeross Park, Crawley (gr., Mr. Offer, and Mr. E. Mercuer, Woodslee Gardens, Brighton. The awards were wen in the above order; Mr. Marken had grand specimens of Croton Warreni, C. angustifolius, Cycas revoluta, and Ixora Williamsii. Mr. Warren folius, Cycas revoluta, and Inora Ommansa. As was also let for six Stove and Greenhouse Ferns, his best in the contract of the was also by hot six bound D. Mooreana, Messrs. W. Miles & Co., Church Road, Hove, followed
Mr. A. Gibson, gr. to T. F. Bunnary Atkins, Esq.

Halstead Place, Sevenoaks, was 1st with a good specimen Hipladenia Brearleyana for a stove plant in bloom, and 1st with tyeas revoluta for a specimen foliage plant, J. WARREN, Esq., Handeross Park, following very closely in each case.

ESq., Handeross Park, following very closely in each case.
Gloxinius were good, the best six plants being shown by
Mr. J. Holman, gr. to F. CRUNDEN, Esq., Burgess Hill.
Messrs W. Milles & Co., Hove, were in front of J. Warren,
Esq., and Mr. Lawrance for six smill Crotons, with very
bright - coloured plants; while for six Pracenas, Mr.
WARREN was ag on to the front
Mr. E. Meagury were list and that for six Palmas bath WAHERN WAS AG ON TO THE FROM MESSES, MILES & Co, and Mr. E. MEACHEN were 1st and 2nd for six Palins, both staging some really well-grown plants. Mr. J. Lewes, 37, Preston Park, Brighton, beat Mr. G. Miles, byke Road Mirsery, for six British Ferns in pots; and Mr. G. Simms, gr. C. Lewis and Mr. G. Simms, gr. to C. J. INWOOD, Esq., The Retreat, Brighton, won in a strong

The class for twelve table plants in 6 inch pots brought several competitors, and the 1st prize was taken by Messrs. W. Mills & Co., Hore. There were only two exhibits of a

table of Orchids and Ferns, and the 1st prize was won by Mr. H Garnett, gr. to R. G. FLETCHER, Esq., Preston, Brighton

Cut Flowers.-For a box of twenty-four varieties of stove and greenhouse flowers, Mr. W. Archer, gr. to Miss Gibson, Hill House, Suffron Walden, was well in front; Mr. J. Davis, r. to Major E. H. THURLOW, Buckham Hill House, Uckfield, following

Roses were fairly good, the 1st prize for twenty-four varieties going to Messrs. Perkins & Sons, Coventry, whose best blooms were Midame Eugénie Verdier, Star of Waltham, Dist blooms were Middine Engelie Verdier, said of Walham, and Comte Raimbaud. Mr. T. Dubrant Young, Eastbourne, was 2nd. For twelve Tels or Noisettes, Messrs, Perkins were again 1st, but were closely followed by Mr. H. Harris, gr. to Mrs. Eversfield, Denne Park, Horsham.

gr. to Mts. Eversfield, Denne Park, Horsham.

Dahlias were really good, especially the Cactus and show varieties. For forty-eight show or fancy varieties, Mr. MORTMER, Swiss Nursery, Farnham, was a good 1st, Mr. M. V. Seale, Sevenoaks, following. Mr. MORTMER and Mr. M. V. Seale were also 1st and 2nd for twenty-four varieties; and Mr. Seale beat Messrs, Cheal & Sons, and Mr. Seale beat Messrs, and Mr. Seale beat Messrs, Cheal & Sons, and Mr. Seale beat Messrs, and Mr. Seale beat Mr. Sea varieties; and all issues beautiful some solutions of single Dahlias. Mr. Seale was 1st for a grand lot of Cactus (twelve varieties), Penzance, and Delicata. Messrs. J. Cheal & Sons were 2nd. A class for twenty-four varieties of herbaceous cut 2nd. A class for twenty-four varieties of heroaceons cut flowers brought out some grand lots, Mr. J. Charlton, Tun-bridge Wells, being placed 1st for a beautiful collection, The table decorations were not equal to the usual standard,

but floral devices and bouquets were fairly good.

Fruit (Open —There were eight competitors for a collection of eight dishes of fruit, Mr. G. Goldsmith, gr. to Sir E. G. LODER, Bart., Leonardslee, Horstam, being 1st with grand dishes of Nectarine, Pine apple; Fig, Brown Turkey; Pear, Williams' Bon Chretien; Peach, Violette Hative; dishes of Nectarine, Pine-apple; Fig, Brown Turkey; Pear, Williams' Bon Chretien; Peach, Violette Hative; and Black and White Grapes. Mr. H. Harris, Denne Park; Horsham, was 2nd. Thirteen competed for three bunches of Black Hamburgh Grapes, Mr. T. Dancy, The Gardens, St. Leonard's Forest, Horsham, and Mr. G. House, gr. to Sir F. Mowatt, K.C.B., Withdean Hall, Brighton, being 1st and 2nd respectively. For three bunches of any other Black Grape, Mr. W. Cheater, gr. to Sir W. Pink, Shrover Hall, Cosham, won with Madresfield Court; Mr. T. Busnay, Heene, Worthing, being 2nd with well-finished bunches of Black Alicante. Mr. Tidy, gr. to W. K. D'Arcy, Esq., Stannore Hall, Middlesex, won for three bunches of white Grapes, with Muscat of Alexandria; and Mr. Duncan, gr. to C. J. Lucas, Esq., Warnham Court, Horsham, was a close 2nd with the same variety.

2nd with the same variety.

Mr. C. M. Carter, gr. to F. Freeman Thomas, Esq., Ratton was in front for two Melons, distinct varieties; and Mr. G. H. Was in Front for two sterois, distinct varieties, and the Sage, Ham House, Richmond, 1st for a single Melon. The Briotrop Florier Stories were well in front of Mr. G. Goldsmith, gr. to Sir E. G. Loder, Bart. for two dishes of Peaches; and Mr. I. W Bastin, gr. to A. J. Reynolds, Esq., Welwyn, Herts, won with Princess of Wales Peach in a class for one dish. Mr. J. Coles, gr. to H. FAURE WALKER, Esq., Highley Manor, Mr. J. Coles, gr. to H. FAURE WALKER, Esq., Highley Manor, Balcombe, was 1st for two dishes of Nectarines. Mr. G. H. Sage, Ham House, Richmond, won in a very strong class for four dishes of Dessert Apples, the varieties being Duchess of York's Favourite, Worcester Pearmain, Lady Suddley, and Duchess of Oldenburgh. Mr. A. H. Pansons, Malling, Lewes, winning for four dishes of culinary Apples.

winning for four dishes of culmary Apples.

Vigetables were extra good, especially Onions, Potatos, and Celery. For a collection of nine kinds the competition was very keen, Mr. W. Manton, gr. to Mrs. CLIFFORD BORRER, Pickwell, Bolney, winning with Ne Plus Ultra Beans, Bragnell's Exhibition Beet. Antumn Giant Cauliflower, Rousham Park Hero Onion, Autocrat Pea, Sutton's Perfection Tomato, New Interpretable Carrett. Sutton's Abundance. Peters and Suttonian Carrett. Intermediate Carrot, Sutton's Abundance Potato and Sutton's White Gen Celery; all very good. Mr. J. Mitchell, gr. to Major Maberly, Cuckfield, was 2nd. For a collection of Potatos (6 varieties), Mr. G. Goldsmith, gr. to Sir E. G. LODER, Bart., Horsham, was 1st out of a dozen or more

Honovary Exhibits.-The chief of these were from Messrs. J. Veitch & Sons, Chelsea, who had a grand collection of caladiums, Java Rhododendrons, Nepeuthes, and a fine pair of Cephalotus follicularis Messrs. Balchin & Sons, Brighton, again had one of the best features in the show, being a series of Eastern arches decorated in a most tasteful manner, series of Eastern arches accorated in a most castern animal, and filled with L liums, Crotons, Palms, Bulbs, and a collection of fruit. Cactus and Pompon Dahlias came from Mr. J. Charleton, Tunbridge Wells, and also from Messrs. J. Cheal & Sons, Crawley. A grand collection of gathered truit, also fruiting trees in pots, came from Messrs. T. RIVERS & Sons, Sawbridgeworth.

READING HORTICULTURAL.

August 26 -The Summer Exhibition of this Society was held in the Forbury Gardens, Reading, on the above dates. There was a fine display of fruit and vegetables, also of plants and cut thowers. The site of the show was an extremely good. one, being a basin covered by canvas; the various exhibit. were staged on grass mounds intersected by gravel paths. The wooden staging commonly seen was thus entirely avoided.

Plants.—For a Group of Plants arranged for effect, the 1st prize was awarded to Mr. Wills, Shirley, Southampton. It was a well-arranged group; and rising out of a bank of Maidenhair Feru were various Orchids, Palms, Crotons, Eucharis, &c. 2nd, Mr. Pope, gr. to J. P. White, Esq., Wargrave, this was a bright and showy group, but rather too crowded with flower-incomparison. ing plants.

In the class for a smaller group, Mr. Howard, gr. to Mrs. Myens, Benham Park, Newbury, was 1st; and Mr. Alexander, gr. to R. Hewitt, Esq., St. Mary's Hill, Reading, was 2nd.

The most successful exhibitor of Stove and Greenhouse Plants in flower was Mr. Fincht. He staged Ixoras Williamsi and Fraseri, Allamanda grandiflora, Clerodendron Bal-fouri, Statice profusa, and an Erica. Mr. Wills was 2nd, his specimen of Rondeletia speciosa may be mentioned.

For six fine-foliaged plants, Mr. Finen was again 1st, with

Croton Queen Victoria, Cycas circin d s, C. revoluta, Phornix reclinata, &c.

In the class for six Ferns, the 1st place was taken by Mr. Dockrill, gr. to G. W. Paimer, Esq., Elmhurst, who staged Alsophila australis, amongst other Ferns; 2nd, Mr. Willis, gr.

to H. A. SIMONDS, Esq., Caversham.

For a specimen plant in flower, Mr. Beight, gr. to J. B KARSLAKE, Esq., Whitenights, competed the most successfully with a good example of Fuchsia elegans.

In the class for three Orchids in flower, the best exhibit was that of Mr. Woolford, gr. to A. Palmer, Esq., East Thorp; he had Cycnoches chlorechilon, Dendrobium formosum giganteum, and Cattleva Downina.

The next class was for a specimen of a new or rare plant, The best was a good example of Cordyline australis lineata, from Mr. Dennis, gr. to W. R. Cookson, Esq., Binfield Park, Bracknell.

Competition for the best six table plants was keen, and those staged were good; 1st Mr. W. H. Lees, gr. to F. A. Bevan, Esq., Trent Park, New Burnet.

For six Fuchsias, Mr. BRIGHT was a good first, the varieties Mrs. Rundle and Charming Queen were well represented

For six double zonal Pelargoniums, Mr. Woolford was a

Six Begonias were well shown by Mr. Dockrill.

In the amateur classes Mr. Willis staged four well flowered stove and greenhouse plants, including Paneratium feagrans

Cut Flowers were well exhibited, the single Dahlius being the best Messrs. Chear & Sons, Lowfield Nurseries, Crawley, were 1st with Marion Hood, Miss Morkard, Miss Roberts (good yellow), &c.; 2nd, J. W. Girdlestone, Esq., who staged a splendid bunch of Derrest, and several seed-lings, of which Trilby was good, it is a rich maroon fieling to

e trinine and white at the tips, a good fancy of a constant type.

For Caetus Dahlins, Mersis, Chext. & Sons were again 1st. stiging good examples of Mrs. Peart (whiter than usual), Mrs. Wilson Noble, and Beatrice. 2nd, Mr. E. F. Sucut,

Maidenhead.

For eighteen double Dablias, Mr. J. Walker, Thame, was 1st with John Hickling, Perfection, John Walker, &c. Messes, Cheal & Sons, 2nd.
For twelve Dablias, Mr. Thanter, Hendey-on-Thames, led

with a good even set.

For twelve Roses, H. P., and twelve Tea varieties, Messes, Perrins & Co. were 1st with a good exhibit for the season.

For eighteen bunches of cut flowers, Mr W. H. Lees led

with an exhibit of fine quality, consisting of stove and greenhouse flowers, including several Orchids, Mr. E. F. Stett was 2nd, staging good bunches of hardy flowers.

The best bougnet was that of Mrs. Phippen, florist, cading. For bottonholes, Mrs. Phippen and Mr. Lees were Reading.

1st and 2nd respectively,

The competition for table decorations was poor. In both classes, however, the 1st prize was gained by very tasteful and pretty exhibits from Miss Elsie Wadmore, Bisingstoke.

Fruit. $-\Delta n$ exceedingly close competition occurred in the ass for eight dishes of fruit Mr. W. H. Lees was lst, with Frac.—An exceedingly close competition obscurred in the class for eight dishes of fruit. Mr. W. H. Lies was list, with fine Black Hamburgh and Muscat of Alexandria Grapes, Brown Turkey Figs, Royal George Peach, Kirke's Plums, &c. 2nd, Mr. Cole, gr. to Sir Groude Russell, Swallowfield Park, with extra fine Muscat and Black Hamburgh Grapes, Pinespale Venturings and sold Parkles and Malon.

apple Nectarines, and good Peaches and Melon.

For six varieties, Mr. Dennis was 1st, with good Bow od Muscat and Alicante Grapes, Williams' Bon Chretien

Pears, &c.

For three bunches of Black Hamburgh Grapes, Mr Mitchell, gr. to J. W. Fleming, Esq., Chilworth Manor, Il uits, was 1st, with unusually fine specimens, very large and wellcoloured berries; 2nd, Mr. Mellattie, gr. to the Duke of Wellington, Strathfieldsave.

For any other black, Mr. M. HATTIE was 1st with Madres-

field Court, extra fine in bunch, berry, and colour.

For three bunches of white Grapes, Mr. Cole was 1st with Museat of Alexandria, staging heavy, well-proportioned bunches, large in berry.

For six Peaches, Mr. Bowerman was 1st with bandsome

fruits of Barrington.

For six Nectarines, Mr. II ward was 1st with large richly-coloured Pine Apple. Mr. Howard was also lst for Apricois, staging D'Alsace

For three distinct dishes of Plums, there was good compolition. 1st, Mr. Ravenhill, gr. to J. Wells, Esq., Woodside, Winkfield, with large, handsome, well-coloured fruits of Webster's Greengage, Pond's Seedling, Prince Engleheart.

For Dessert Apples, Mr. WOOLFORD was 1st with Devonshire Quarrenden, Worcester Peurmain, and Lady Sudeley. The same exhibitor was 1st for culinary Apples.

For Dessert Pears, Mr. Pope, gr to Earl of Carnaryon, High-dere Castle, was 1st, with Jargonelle, Clapp's Favourite and Williams' Bon Chrétien, excellently grown and finished. For Melons, Mr. Dockkitt took the 1st place for both

scarlet and green flesh.

Vegetables. - For the special prizes offered by Messrs Str. TON & Sons for a collection of Vegetables, some remarkably fine examples were staged; Mr. Pore, Highelere Castle, was 1st, with a uniformly good exhibit, of which we will mention Cauliflowers, solid, large and snowy-white; Carrots, clean and shapely; Reading Russet Potatos very handsome; large "Globe" and Crimson Globe Onions; Cabhage, Eload-red Mr. Bowerman was a very close 2nd -his Onions were very

For the special prizes offered for Veretables by Messrs. WEBB & Soxs, the 1st prize was taken by Mr. Lye, gr. to Mcs. KINGSMILL, Sydmonton Court, Newbury; Onions, Carrots, and Cauliflowers were the best.

Honorary Exhibits included Dahlias from Messrs J. Chemi & Sons, and Me-srs. Jas. Verron & Sons, Chelsea, who had also a very good collection of hardy flowers and some Figs in pots, also other fruit, including a collection of Plums. Paireen, Reading, exhibited various Floral Designs.

BATH FLORAL FETE.

AUGUST 26, 27. One of the best autumn shows ever held under the anspices of the Fête Committee took place in the Sydney Gardens on the above date. The day was showery, with occasional thunderstorms.

Fuchsius - Chese have been such a leading feature at Bath or many years just, that it is not to be wondered at they are in the forefront of the schedule. But a sad fallog-off was perceptible. Mr. G. Tucker, gr. to W. P. CLARK, Esq., Trowbridge, who took the leading prizes at the recent Trow-bridge show, was again to the fore here with nine plants, having good examples, much better than is usually seen at shows out of the West of England; Mr. G. Scott, gr. to Mrs. CONNELL, Bath, was 2nd.

Mr. J. H. Witcox, Bath, had the best six, staging nicelygrown and bloomed plants.

Mr. W. Haskell, Bith, was the only exhibitor of fear retimens. The best specimen light-flowered Fuchsia was specimens. Arabella, from Mr. G. Teckha, a very fine plant. Arabella, from Mr. G. Teckea, a very fine plant. The best dark-flowered plant was Charming, also from Mr. G. Teckea.

One very fine feature was the class for twelve ornamental foliage plants, and six specimen stove and greenhouse plants in flower. Mr J. CYPHER, nurservin in Cheltenham, was 1st, with a very fine lot indeed, having grand examples of Phoenix rupicola, Kentias Fosteriana, Belmoreana, and australis; Thrinax elegans, Latania borbon'ea, Crotons mortfontensis, Warreni, Johannis, and Thompsoni. Statice Gilberti, Bargainvillea Sandersana, Inomison. Statice Giberti, Bargamvillea Sanderani, Bagabra, Phonocoma prolifera Barnesi, Ivora Regina, and Allamanda nobiles; 2nd. Messrs. E. S. Cone & Co., norserymen, Bath, who had some fine Palms and other good specimens. Messrs. E. S. Cone & Soxs were 1st with eight specimens. Messes, E. S. Corr & Sons were 1st with essent ornamental foliaged plants, having good specimens of Latinity and methalis. Overs revolut to borbonica, Kentris Fosteriana and australis, Cycas revoluta, and Crotons; Mr. G. Hallert, was 2nd.

Groups of plants arranged for effect were better than we have to bre seen them here, Mr. J. CAPBER having one of his usual charming arrangements, in which Palms and bralliantly-colourel Crotons were used, with a judicious admix* ture of flowering plants; Mr. Tanser, gr. to Mr. R. B. CATES, Bath, was 2nd.

With ten stove and greenhouse plints in flower, Mr. J. Cypiter was again 1st.

The best specimen store plant in flower was Ixora Fraseri, from Mr. G. TOKER; Mr. J. CYPHLE was 2nd with Dipla lenia

Mr. J. Cypher had the best specimen greenhouse plant, staging Statue intermedia, a cross between S. profusa and S. Holfordi.

Ericas were shown only by Mr. J. Cypher, who had six d specimens in several varieties. The best specimen was E. Marnockiana.

Exotic Ferns were shown by Mr G. Tucker, who had Exotic Ferns were shown by Mr. G. Tevers, who have excellent specimens of Gymnogramma argyrophylla, G. sulphuret, Cheilanthes farinosa, C. elegans, Adiantum concinnum latum, A cuneatum, Gleichenia rupestris, and others; Messrs. E. S. Cole & Co. were 2n l, staging some gool Adimtums.

Mr. T. Truckle, gr. to T. Cabr. Esq., Twerton, Bath, was 1st with six specimens. The best specimen Fern was Adiantum Williamsii from Mr. G. TUKKER.

Zonal Pelargonium were of good quality, Mr. G. Tuckes winning with some excellent specimens; Mr. W. J. Moclio, Bath, was 2nd. Some specimens of lvy-leaved varieties were also shown. The best three Lilies were L. speciosum from Mr. T. Carr. Cockscombs were in excellent character; also Petunias, double and single-flowered tuberous Begonias; Glovinias, &c. Some good bushes of Colens were also staged.

that Flowers.-There were two collections of thirty six spikes of Gladioli, one greatly superior to the other, but the names of the exhibitors were not given at a late hour of the afternoon. The best collection of twelve spikes came from Mr. A. A. Walters, murseryman, Eath, the spikes being remarkably good.

With twenty-four Dahlias, Mr. WM TRESEDER, nurseryman, Cardiff, was 1st, having some very good blooms; and Mr. Ger. Humpheles, nurseryman, Chippenham, was 2nd. With twelve blooms, Mr. T. Lindsay, Frome, was 1st. Mr. G. Humpheles had the best nine funcies; and the best twelve bunches of singles came from Mr. J. Burgess, Kingswood, an excellent collection of fresh and bright flowers.

With twenty-four bunches of Roses, Mr. S. Treseder was 1st, staging some nice fresh, bright blooms, the Teas being particularly good. Mr J. MATTOCK, nurseryman, Oxford, vas 2nd, with blooms a little larger, but which were scarcely so clean and bright.

With twelve blooms Dr. Buth was 1st with a fresh and bright lot. The best box of twelve Tea Scented varieties came from Mr. S TRESEDER, and among them a white variety tinted with lemon, named Mrs. Stephen Treseder. Mr. J. MATTOCK

Cut Zonal Pelargoniums were of capital quality, and seeing that six trasses each of twenty-four varieties were required it was a somewhat heavy task to produce them. Mr. G HUMPHRIES Was 1st with some very fine varieties; and Mr. W. J. Morto, Bath, 2nd. Quilled German Asters, and also the flat petalled type, were very fine, the season being considered. Mr. O. C. H. Vickery had the best twenty-four quilled; and Mr. A. Walters was 2nd. J. Histon, Esq., Eath-easton, had the best twenty-four French Asters Phloxes had suffered from the weather; and Hollyhocks were only of medium quality. Store and greenhouse cut flowers were very good in bunches of twelve.

Flowers of hurdy, herbiceous and other perennial plants, in twenty four bunches, were very striking, Mr. A. A. WALTER - taking the 1st prize.

Hurdy Annuals, in 24 bunches, were also a fine feature, and Mr. F. Hooren, Bith, was 1st.

Table Decorations were represented by but one arrange-

ment, a charming one of flowers and fruit furnished by Messes E. S. Cole & Co. Mr. J. Cypher had the best Epergue, set up in his usual good style.

Some very pretty but puts were staged, and in the class for an arrangement of one kind of flower in a single vase or howl, Messrs Coortno & Sons, Bith, used Salpiglossis, with Schaginelly and Grasses, a happy combination and one that was much admired.

Evait Apples and Peirs were very fine, and the dessert varieties brilliant in tint. The best 12 dishes came from Mr. varieties brilliant in tint. The best 12 dishes came from Mr. G. Pymin, gr. to Mrs. Gouldsmith, Trowbridge, who had fine bin these of Black Humburgh Grapes, week in colour; go of White Museats; Exquisite and Prince of Wales Peaches, Pine Apple and Humboldt Nectarines; Whate Ischia Figs, Bon Chectien Pears, Phuns, & v.; 2nd, Mr. Thouves Jones,

Mr. W. Taylor, gr. to J. Chaffin, Esq., Bath, had the best eight bunches of Grapes, stuging two each of Madresfield Court, Alicinte, Muscat of Alexandria, and Gros Muroz. Mr. ylor, gr. to C. Bayen, Esq., London, was a very close Mr. Bayen was 1st with two bunches of Black Hamburgh, very fine and well finished. Messrs Marriott, Bith, was 2nd, medium berries, but well finished.

Mr. W. Carpentor, gr. to A. R. Batter, Esq., Frome, was 1st with two fine bunches of Museat of Alexandria; Mr. C. BAYOR had the best two bunches of any other white, staging very fine Bucklin I Sweetwiter Mr. Baver also had the bes two bunches of any other black, stiging superb Myd-residel Court Melons, Peaches, Nectrinos, Plans, Figs, Cherros, Nuts and Filberts were ingoodly numbers, and the quality was generally high. The best three dishesof Pearscame From Mr. G. MANNING, Batheaston, who had in fine character Souvenir du Congrès, Doyenné Boussouch and Beurre d'Aminlis. The best three dishes of Dessert Apples were xamples of Ludy Sudeley, Duchess of Oblenburgh, and Worcester Peurmain.

Vegetables were numerous and good. The best twelve dish's came from Mr. Wilkins, gc. to Ludy T. Guest, Henstralge; and Mr. Geo Gardaway was 2nd.

Mr. WILKINS took the 1st of the Special Prizes offered by Messrs, Jas. Carter & Co. for six dishes; and in the case of the Special Prizes offered by Messrs. Sutton & Sons and Messrs. E. Webb & Sons, both for six varieties, Messrs. Where Severally 1st and 2nd.

Honorory Erhobits. - Messes, G. Cooling & Son had a grand group of plints and cut thowers, and a collection of seventy-two varieties of Apples, Pours, and Pluns. Mr. Geo. Garaway also had an extensive collection of the same, and a so cut flowers. Messrs, Right & Ruddock, seedsmen, Bath, had an imposing bank of cut blooms. Mr. G HUMPHRIES had a deet collection of Caetus Duhlias, very fresh and nice. Mr. Marrock had charming bunches of Garden Roses; and Mr. Is vie Hotse. Westbury on Tryin, some very good fancy

VEGETABLES.

VEITCH'S MAIN CROP PEA.

I CAN fully endorse all that "J. E." said in last week's Gurd mers' Chronicle, p. 215, on the above variety of culinary Pea Here, on rather light soil, it resists drought and mildew well; and from April 18 to August 18 our rainfall amounted to only 3 35 inches, no other part of the country having suffered more from heat and drought this year than western Englan 1; yet Main Crop gave much satisfaction. I know of many good gardens around us where eight to ten rows of 30 to 40 feet long, sown with mid-season Peas, were destroyed without furnishing a single dish. We were fortunate in possessing a few rows of Mai i Crop, and wished that we had had more. Ne Plus Ultra and Autocrat are varieties which look well, and the latter is a grand Pea late in the season. Chelsonian also looks very promising, and I expect good results from it in about two months from the present date. Thos. Sh'n ples, Tortworth.

MARKETS.

COTENT GARDEN, AUGUST 27.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotitions. It must be remembered that these quotitions do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

Trade generally slow, large quantities of all kinds in stock. Prices rule lower. Best samples, 65s. to 70s.; Ordinary, 40s, to 50s, per ton. J. B. Thomas.

SEEDS.

London: August 20.—Messrs, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that although to-day's market was thinly attended, there comes from the country a good steady sowing demand for seed-required for present use, namely, Trifolium, Mustard, Rye-gass, Tares, Rye, &c: values for all t ese show no substantial change. French Trifolium is in fair supply, but tome-grown seems about used up. The new English white Mustard seeds show fine quality. Rape seed keeps firm. As r gards the market for bird seeds, there is a marked undertone of increasing stength. Boiling Peas attract increased attention. Haricot Beans are undoubtedly firmer. Buckwheat is very steady.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named; and this combined result is expressed in Daydegrees—a "Pay-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

following:—
0, Scotland, N. Principal Wheat-producing Districts—
1, Scotland, E.; 2, England, N.E.; 3, England, E.;
4, Midland Counties; 5, England, including London, S.
Irincipal Grazing, &c., Districts—6, Scotland, W.;
7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August 22, is furnished from the Meteorological Office:—

"The weather during this period was somewhat dull, rainy and unsettled in all the western and north-western districts, and these conditions extended gradually to almost all parts of the Kingdom as the week progressed. The rain was not generally heavy, but some rather large amounts were

not generally heavy, but some rather large amounts were recorded at some of the north-western stations.

"The temperature was below the mean in all districts, the deficit varying from 1° to 2. The highest of the maxima were registered on rather irregular dates, and ranged from 1% in 'England, S.' to 68' in 'England, N.E.,' and to 65' in 'Scotland, N.'. The lowest of the minima, which occurred, as a rule, on the 17th, ranged from 36' in 'Scotland, E.,' 37' in 'Scotland, N.', and 38' in 'England, S.W.,' to 45' in 'England, N.W., and Ireland, N.,' and to 53' in the 'Channel Islands.'

"The rainfull was a little more than the mean in 'England, E.,' and just equal to it in both the districts of Ireland, elsewhere there was again a deficit.

Freland, elsewhere there was again a deficit.

"The bright sensitine was deficient in nearly all districts, but slightly exceeded the mean value in 'Scotland, E. and England S and N.W.' The percentage of the possible duration ranged from 48 in the 'Channel slands,' 47 in 'England, S.,' and 45 in 'England, S.W.,' to 20 in 'Scotland, N.,' and 18 to 19 in the Irish districts."

NARROW BORDER FACING S.W., WITH HEDGE OF PRIVET AT THE BACK: H. T. Of bulbs, you might plant Gladiolus, Tritonias, Ixias, Triteleia uniflora, Montbretia erocosmiflora, Crimum Powelli, Nareissus in variety, late and early varieties of Tulipa, Iris xiphion, I. iberica, I. biflora, I. versicolor, I. Histrio, and hardy Lilies of all species, Kniphofias of small stature might find a place in the back rows, as also Bamboos, Eulalias, Clematis Jackmanni and others grown ou stout poles, and Canna indica in the newer varieties. Intermixed you might plant Hemerocallis in variety. Iberis gibraltarica, Violas, Pansies, Violets, Polemonium corruleum, Helenium autumnale and others, Saxi-

fragas, Campanulas, Pyrethrum rosenm in variety, Funckias, Carnations, and Piuks. As bushes, to impart variety, plant Olearia Haasti, Hypericum Audrosæmum, H. elatum, H. hircinum, Berberis Fortunei, B. dulcis, B. stenophylla, Indigofera Gerardiana, Deutzia scabra in variety, D. gracilis, Acer palmatum (polymorphum), Philadelphus microphyllus, Daphne Mezereum, and Hydrangea hortensis.

BOOKS: R.O. Tomato Culture for Amateurs, by B. C. Ravenscroft, Illustrated (L. Upcott Gill, 171, Strand, W.C.).—Duphne. Chrysanthemums and their Culture, by Ed. Molyneux, published at 171, Fleet Street, E.C.—The Book of the Rose, by the Rev. Foster-Melliar, M.A. (Macmillan & Co., London).

Canterbury Bells: A. F. These should be sown for standing the winter in the middle and end of July. It is nowrather late to sow, although the plants will survive the winter, and flower late in the summer. It is always safe, in view of very severe frosts, to keep a good proportion of the pricked-out plants in deep boxes in cold frames, where some further kind of protection may be afforded when necessary. There must, however, be no coddling of those which are expected to bloom out-of-doors.

COLEUS: T. R. IV. The variety is a good one of the large-leaved section, but we have seen others very similar. So many seedling Colens have been raised, that it is rare a new one is of much value. Still, for your own purposes it may be desirable to perpetuate it.

CORRECTION.—Shrewsbury show, re Carnation exhibits, for Mr. Forbes, Warwick, read Mr. J. Forbes, Hawick.

EARLIEST RHUBARRS: A. F. Mitchell's Royal Albert and Hawke's Champagne.

Enumics and Daulias: A. F. Having exhausted the ordinary methods, you might try prevention. There is sold a sort of zine trough for holding water and placing round the stem of the Dahlia at a few inches distant from it that is said to have the advantage of preventing the ascent of the insect, and these troughs are sufficiently elastic to be opened wide enough to admit the stem.

GREEN PEAS to BOITLE: Enquirer. Shell the Peas put them into dry, wide-mouthed bottles, and shake them together, so that they may lie in as little space as possible. Cork the bottles closely, and seal the corks. Bury the bottles in the driest part of the garden, and take them up as they are wanted. They will keep good five or six months. Another way to bottle green Peas:—Choose Peas which are large and fully grown, though not old. But them into perfectly dry, wide mouthed bottles, shake them down, cork securely, and cover the corks with bladder. The a wisp of hay round the lower part of the bottles to prevent their knocking against each other in the pan. But them side by side in a large saucepan, and pour into it as much cold-water as will reach to their necks. But the saucepan on the fire, and let it remain for two hours after the water has reached the boiling point, then take it off, but do not remove the bottles uptil the water is cold. Seal the corks, and store in a dry place.

Insect: Armitage Brothers. The grub found in the soil in which the Primnlas are grown, is the larvæ of one of the common weevils, which, either as grubs or perfect insects, sometimes commit great have amongst potted and other plants. You must search for the former in the soil before using it, or obtain soil from a source free from them. Some pasture loams abound with weevil grubs in some years. The weevils themselves should be sought for at night by the aid of a lantern, having previously spread sheets of white paper, &c., under the plants attacked.

"Knowledge": Enquirer. This journal is published at 326, High Holborn.

Melon, Diseased: A. R. See p. 248.

MUSCAT OF ALEXANDRIA GRAPES: W. G. The berries sent are suffering from an attack of the "spot" fungus, Glavsporium laticolor, and there being no known means of de-troying this without at the same time destroying the fruit, it is prudent to reduce the chances of further infection by burning every affected berry.

NAMES OF FRUITS: Scottish Gardener. Pears: 1, Glout Morecau; 2, Beurré Clairgeau. Apples: 3, Dumelow's Seedling; 4, Pott's Seedling; 5, Hawthornden.—J. K. B. 1, Lane's Prince Albert; 2, thornden.—J. K. B. 1, Lane's Prince Albert; 2, Lord Suffield; 4, Dutch Mignonne; 5, Emperor Alexander; 6, Irish Peach.

NAMES OF PLANTS: Correspondents not answered in This issue are requested to be so good as to consult the following number.— W. P., Epping. Bupleurum fruticosum, planted, not wild.—Wm. W., North Britain. Cattleya Leopoldii pernambucensis, with which C. Victoria Reginæ was imported.—II. P. which C. Victoria Regine was imported.—II. P. I., Selaginella Mertensii variegata; 2, Selaginella Mertensii; 3, Selaginella denticulata of gardens; 4, Selaginella cesia; 5, Adiantum capillus veneris; 6, Adiantum hispidulum.—J. H., Chester. I., 6, Adiantum hispidulum.— J. H., Chester. 1, Gazania variegata; 2, Dracæna Goldieana; 3, Calamus ciliaris (Palm); 4, Schismatoglottis picturata; 5, Gazania splendens.— W. T. T. 6, Lysimachia vulgaris; 5, Galeopsis Tetrahit; 4, G. ochroleuca; 3, Æthusa Cynapium; 2, Sison Amomum; 1, Angelica sylvestris. Oh, that everyone would send good specimens carefully packed, as you do!—J. W. M. 1, Rhus Cotinus; 2, Galega officinalis alba; 3, Cupressus pisifera filicoides (Retinospora); 4, Cupressus Lawsoniana variogata; 5, Capressus pisifera var. plumosa (Retinospora); 6, Cupressus pisnera var. piumosa (recinospora); 6, Cupressus Lawsoniana; 7, Cupressus Lawsoniana var. erecta-viridis.—E. F. W. Escallonia floribunda.—Ash. 1, Geum Chiloense; 2, Lysimachia elethroides; 3, Hemerocallis fulva; 4, Helenium autumnda; 5, Hierecium autumnda; 6, 6 5, Hieracium aurantiacum autumnale; Veronica subsessilis. - John. Lantana salviæfolia. -A. F. Poa annua. — O. B. 1, Cupressus nutkaensis; 2, Cupressus Lawsoniana; 3, send when in flower or fruit; 4, Taxodium sempervirens; 5, Picea ajaueusis; 6, Athrotaxis cupressoides.—W. O. The Cattleya is Cattleya Leopoldi. The Dendrobium Ainsworthi seems to have been prematurely dried off; its young growths seem to have collapsed for want of nourishment.—C. B. The plant is Thunbergia laurifolia syn. Harrisii. We will forward the sum sent to the Gardeners' Orphan Fund.— W. B. Your Vanda corulea is a very fine variety. As regards the veining, it appears more prominently As regards the veiling, it appears more prominently some years than it does others, even in the same plant. — Fr. de Læt, Contich, Gentiana pneumonanthe.—E. J. 1, Solanum capsicastrum; 2, Maurandya Barclayana.—J. F., Pontardanc. 1, Dactylis glomerata variegata; 2, Anemone japonica var. Honorine Jobert; 3, Rhus typhina; 4, Pignenia iagmipoides. Bignonia jasminoides.

NARCISSUS DISEASED: R. O. The bulbs are affected by the Narcissus-fly, Merodon Narcissi, an insect which is fully described, together with several allied species in trandeners' Chronicle, 1842, pp. 103 and 104. We should recommend an entire change of ground, and careful examination of the bulbs before planting, and all in which holes at the sides are found should be burnt forthwith. Such bulbs contain the magget which eats its way out at the base of the bulb, enters the soil, and changes into a pupa. April is the month when most of the flies hateli.

EAKALE: A. F. "Sets" may be planted from the beginning of March to the middle of April. Seed Seakale: A, F. is best sown in boxes after soaking it for a few hours in water, and grown cool for a time, and then pricked out before finally planting out.

SPINACH: A. F. The Longstander or Giant Viroflay Spinach to stand the winter should be sown at the end of July and during the present month.

SPRING GARDENING: Amateur. Plant the circular heds with bulbs. As there are three, one might contain Tulips, and the others Hyacinths, or ressi. The beds might be edged with dwarfer-growing bulbs, or by some early-flowering plant, such as Myosotis dissitiflora, or white Arabis. The scroll-beds could be planted with double and singleflowered Wallflowers, with a band of Silene pendula, edged with white Arabis. They are so small that much variety in them would not be advisable.

WINTER CAULIFLOWERS: A. F. Early Erfurt, Early London, and Lenormand's Short Stalked. The first-named may be forced or not, and if forced, the seed should be sown in the middle of the month of January in heat. Stadtholder forms a good succession to Early London.

Communications Received.— N. M. B.—W. V.—H. W.— T. W. R.—Paddy, from Cork.—A. B.—J. P.—C. K.—J. K. T. B., Elmet.—H. C. T.—F. Wicks, next week.—J. T. T.— J. Cowan—H. W. W.—W. Kelly.—H. H. D.—P. With each order one bag of our Celebrated Fartilising Moss The successful medium for Plant Culture.

Such Unsolicited Letters as the following are continually reaching us:-TRUTH.

Such Uncolicited Letters as the following are continually reaching us:

The Gardeus, Politimore Park, Exeter, July 25, 1896.

Dear Sirs,—Yours to hand. Your Continuatal Wood-Wood is the fine typacking material that I am acquainted with: sift as sith. Peing asked by a Fruiterer what it was. I had a pleasure in recommending it.

And now just another word for your Le Fruitier. It is some eight years since I commenced using it for fruit trees, and still I have the same high opinion of it as I had the first year I tried it. I am gathering reaches from a tree which is carrying 13\frac{1}{2} dozen fruits, which for colour are perfection; while my noble employer tells me the flavour is all that can be wished for; this tree, with the others in the same house, has been fed with Le Fruitier. As an inure for fruit trees it has no equal. It promotes the growth of wood suitable for giving fruit, and also produces leaves of a leathery texture: two very essectial things in fruit growing. Applied to Vines, it produces Grapes of splendid colour, with a hammered appearance in the berries which is very desirable in well-grown Grapes.—Yours truly, T. H. SLADE, Head Gardener to the Right Hoo. Lord Poltimore.

MESSRS, PROTHEROE AND MORRIS will SELL by AUCTION at their Central Sale Rooms, 67 and 68, Cheapside, London, E.C., on FRIDAY NEXT, Sept. 11, at Half-past Twelve o'Clock—

BY ORDER OF MESSRS. F. SANDER & Co., St. ALBANS.

VARIED SELECTIONS of IMPORTED ORCHIDS, including Lælia Dormaniana, Saccolabium giganteum, an Aérides apecies, a Vanda species, Cattleya velutina, and Aerides crassifolium.

crassifolium.

A CATTLEYA SPECIES, from the neighbourhood of Rio. The Plants here offered are the unsold lots from our Sale of August 28. Our collector wrote so etrongly of this type, they are so distinct-looking, and we believe euch an altogether good variety, that we have decided to again offer these Plants, and without any reserve: Sophronitis grandiflora, Cymbidium Lowianum, Anguloa Clowesii, and Dendrobium infundibulum.

CYPRIPEDIUM NIVEUM.—The biflorum type from the Tambelan Islands. The finest of all, noted for the large size and sation, whiteness of the flowers and the abundance with which they are produced. C. aiveum is now very scarce and almost impossible to obtain; niveum hybrids are among the daintiest and most valuable of all.

DENDROBIUM NOBILE, LANG TANG VAR.—From the district, which has yielded so many rare and valuable varieties, Amesiæ, Sanderes, Sanderianum, Ballirianum, Rolfæ, grandiflorum majus, &c., &c.

ODONTOGLOSSUM ALEXANDR.E.—Distinct varied-looking plants of the very finest Pacho type,
The contents of a small case of MIXED ORCHIDS.

(Continued on nert column.)

PHALENOPSIS VIOLACEA VAR. FROM BORNEO, in splendid order. Flowers rich amethyst purple shading into yellow. Grows in any stove.

into yellow. Grows in any stove.

PHALE VOPSIS ESMERALDA, fifteen to twenty-five blossoms varying in colour from brilliant amethyst to crimson and pink, borne on erect spikes; most floriferous, and invaluable for florists and decorative work.

CYPRIPEDIUM EXUL.—Extra strong leafy plants of this useful and attractive species.

DENDROBIUM THYRSIFLORUM, &c.

ANOTHER PROPERTY.—Cattleys Aclandize, Cypripedium Roczlii, Angulos Ruckerii sanguines, Odontoglossum crispum, yellow var., Ada aurantisca, epicudid specimen; Peristeria elata, fine specimen, &c. &c.

Also one fine plact in bud of VANDA SANDERIANA.

THE SELLY HILL COLLECTION of ORCHIDS.

MESSRS. CHARLESWORTH & CO.

Have great pleasure in announcing that they have purchased the entire COLLECTION of ORCHIDS formed by CHARLES WINN, Esq., The Uplands, Selly Hill, Birmingham.

Mr. Winn is one of the oldest Amateurs, having been forming his Collection for over thirty years, during which time he has brought together one of the choicest and most select lot of plants ever seen.

The Collection is up to date in Novelties, and is especially rich in

CATTLEYAS, LÆLIAS, CYPRIPEDIUMS, DENDROBIUMS ODONTOGLOSSUMS, & MASDEVALLIAS, BOTH SPECIES & HYBRIDS.

Messrs. CHARLESWORTH and CO. are preparing a CATALOGUE of the PLANTS, and will shortly distribute the same to all their friends and patrons. Any one desiring a copy whose name is not on their books, will be supplied on application.

THE PLANTS WILL BE ON VIEW FROM SATURDAY, SEPTEMBER 12.

VALUABLE ORCHIDS.

About 20.0 fine Specimens of RARE ORCHIDS.

About 20.0 fine Specimens of RARE ORCHIDS has just arrived, in splendid condition, in Europe, of which a great many have been gathered in bloom by an experienced Cellector, from quite new localities. A great number are natural bybrids, and unique Odontoglossums; they have been painted by him. Also, there are over fifty amongst them that will be guaranteed numque types, and not existing in Europe—in all about 1000 Odontoglots. The best of Oncidiums, rare varieties; Cattleys Pyanie (after locality), the new labiata April-flowering Cattleys, Cattleya labiata, with its wonderful varieties. Some of these are with over 100 bulbs.

Azulea, the finest Cattleya in the world, large plants, but only a limited number; they were collected in bloom, and there are also pure whites amongst them. There is also an new variety of Cattleya autumnalis, which flowers in its native country at Christmas; lurge sepals and petals, dark crimsinged. Also an unique Cattleya, wonderful variety, grown in an antique Indian-pot; also Cattleya Mossine albi, C. Reinceknana, C. Wagneri alba, and C. Percivalliana alba. Dried flowers, and painted by the Collector.

Not any of the above mentioned will be divided, and the advert'ser would prefer to sell them in one or two lots, or the whole coonsignment to one party.

The whole has be en placed in a private gentleman's hands, and they will be guaranteed by him. Address letters only to—

F. HAWKER, 40, Armoury Sq., Stapleton Rd., Bristol.

Both are invaluable to Chrysanthemum Growers.

H. J. JONES, Ryecroft Nursery, Lewisham.

MUNGO CHAPMAN, late of Easter Duddingston Lodge, Mid-Lothian, begs to intimate to his Iriends and acquaintances that he retires from his present situation on the 20th of the present month. He has arranged to reside at St. Ninians, near Stirling, where he intends to commence the Cultivation and Sale of Hardy Plants on his own account.

With the experience gained during twenty-four years in the management of one of the most choice private collections of plants to be found in the British Isles—that of the late Charles Jenoer, Esq—Mr. Chapman can confidently undertake to supply what is select and true to name of the most suitable plants for Borders and Rock-work.

He hopes to be able soon to issue a Plant Catalogue, from which customers may make their own selection. In the interval, he will be fully employed in getting up Stock.

COLOURED LEAVES.

A MONG our most beautiful foliage plants are undoubtedly those numerous inmates of tropical forests with red or parti-coloured foliage. These plants not uncommonly receive appropriato names from botanists, such as "erythrophylla, sanguinea, variegata, tricolor, &c. The beautiful Bertolonias, Begonias, Caladiums, Marantas are cases in point. Since Darwin's time we are accustomed in phenomona of this kind to inquire what is the use of such colouration, what end do these appearances serve? We need not wonder that the variegation of the leaves of these plants leaves much for the botanists still to account for. Some physiologists consider that these coloured leaves serve as a warning to animals not to feed on them. Others are of opinion that the red colour serves as a kind of protection against an excessive amount of sunlight which might be injurious to the chlorophyll grains. According to a third view, the red colouring matter-the "erythrophyll"-serves to absorb warmth, the red colouring matter absorbing the sun's rays, and in that manner working to the advantage of the plant. All of these theories possess a certain amount of probability, but none is capable of furnishing a satisfactory answer in all cases.

Recently, however, Professor Stahl, of Jena,* has published the results of some very thorough investigations which seem likely to throw some light on the matter. Stahl endeavoured first to ascertain if the variegated foliage deterred animals from browsing on the plants. And he found that several animals to which red and green leaves of the same species were offered at once turned to the green leaves by choice, and only ate the red when pressed by hnnger.

In reference to the theory of protection from the sun's rays, Stahl asserts that the red colour possesses a property of utilising the sun's ray in a manner not possessed by chlorophyll. The theory that red leaves become warmer than green ones, was already rendered probable by an experiment of Kny's. He placed a large number of deep-red and green leaves of a similar size, in vessels containing an equal quantity of water, and he found that after a short exposure to the sun, the water, in which the red leaves were placed, was increased in temperature. Stahl had previously discovered, by thermo-electrical methods, that the tem-

* Annales du Tardia Botoneque de Britanzorg, vel. xin , 2

perature may differ to the extent of almost 2° in the red and the green areas of the same variegated leaf. On the other hand, he found by similar methods, that in white variegated leaves the green portions are warmer than the light portions. Also, that the layer of air cells, to which the light colour is due, lying between the parenchyma and the upper skin of the leaf, acts as an isolator. This cau be proved in a much more simple manner by smearing variegated Caladium leaves with coeea-butter, and eovering the schüsselpunkt, the central point, with beeswax. When a leaf treated in this manner is placed in the sunshine, the coceabutter covering the red spots is the first to melt, then that over the green, and lastly, that over the white spots. The next advantage which a plant receives through this warming of the red portions of the leaf arises from the rapidity with which the various processes of growth are carried on; for we know, from the investigations of Sachs, that the consumption of nutritive matter, especially of starch from the leaves, is constant, by day as well as by night, and that it is less complete on cold nights. By the accumulation of the nutritive matters the process of assimilation is rendered slower. The higher temperature caused by the reddening of the leaves results, therefore, in a quicker utilisation of the nutritive matter.

The greater degree of warmth in the red parts of the leaves of a plant is of great advantage to the plants in other ways, for example, in plants with deep red-coloured styles, which bloom early, and in which, in consequence of the warmth, the development and lengthening of the pollen-tube receives an impetus from the colour of the style.

Still more important is the variegation of the leaves as an aid to transpiration. If we enquire what are the climatic conditions under which wild plants with variegated leaves grow, we find that, without exception, they inhabit very damp localities. In the moist atmosphere of such places, transpiration, and as a consequence, the absorption of nutriment, is exceedingly small, unless the leaves become warmed by the aid of the crythrophyll, and thus a greater degree of fension in the fissues of the leaves is induced, and consequently a greater amount of transpiration.

This transpiration is rendered still more active by the fact that the guard-cells of the stomata do not possess any crythrophyll, and as a consequence remain expanded, cooler, and their turgidity greater; moreover, in our native plants erythrophyll is found in abundance in the neighbourhood of the stomata.

The transient reddening of young leaves is likewise connected by Stahl with transpiration and the more active absorption of nutriment eaused by the reddening. He points to the fact that crythrophyll in the cooler period of spring is strongly concentrated, and as quickly disappears as soon as the first warm nights arrive. From this he shows that in leaves possessing three colours the red spots get warmed the somest, and the light - coloured ones the more slowly; also that the red portions cool the more rapidly.

If a plant with variegated or three-coloured leaves, grows in a wood in a warm, humid locality, the variegated leaves will remain warm for a longer period of time after the surrounding air has lost its warmth than simple green leaves, and will correspondingly give off moisture for a longer time to the surrounding air, U. D., Berlin.

NEW OR NOTEWORTHY PLANTS.

TRICHOMANES (HEMIPHLEBIUM) FRASERI, $J_{enm., n. sp.}$

ROOT-STOCK freely repent, densely crineferous, the blackish vestiture ascending, but not reaching to the top of the paced petioles, which are quarter of an inch long; fronds erect, pale green, pellucid, thinly membranous, glossy, naked, but sparsely setiferous on the veins and margins when young, oblong, oval, or square, sub-flabellate, truncate, a quarter of an inch long and wide, irregularly lobed or more or less freely pinnatifid; midrib distinct to the top; veins conspicuous, and uniformly branched, ramifying into the obtuse lobes; sori confined to the top lobes, one to six in number; involucres translucent, urnshaped, with close, rounded lips at first, which at length open, and form a nearly circular rim; base cuneate, not quite free; receptacles included or excerted

Grenada, West Indies, gathered by Mr. P. Neill Fraser, of Rockville, Murrayfield, Midlothian, who takes a great interest in Ferns, particularly the filmies, and who lately visited Jamaica and Grenada, and made a varied collection of Ferns, among which, from the latter island, this species appeared. In form of fronds its nearest alliance appears to be with T. parvnlum, Poir, and T. proliferum, Blume, both Eastern species. Of American species, its nearest relationship is with T. quercifolium, Hook, and Grev., and T. reptans, Swartz, both common West-Indian species. Of the former, Didymoglossum fractuosum, Fée Fil. Ant., table 28, fig. 3, is a very good representation. G. S. Jenman, Demerara, July 6, 1896.

ACANTHOPHIPPIUM EBURNEUM.

This species is undoubtedly very near to the A. Curtisu, Rehb. f., Gardeners' Chronicle, 1881, i., 169, from which it differs in the following characters. 1. The spur is nearly as long as the ovary (in our species), and slightly geniculate: in A. Curtisii it is shorter, blunt, and straight. 2. The perianth of A. Curtisii is said to be rose-coloured, in this species it is ivory-white. 3. The lip of A. Curtisii has three distinct lobes, in our species the side lobes are scarcely divided from the middle lobe. 4. The disk of the lip of A. Curtisii has five calli, in our species we find only a single sharp triangular line between the side lobes. The plant was introduced by Mr. P. Wolter, Magdeburg - Wilhelmstadt, and flowered for the first time in the July of this year, It is undoubtedly a very nice plant. F. K.

CONTINENTAL NOVELTIES.

NEW VARIETIES OF GERMAN ASTERS.

We have received from Mr. J. C. Schmidt, nurseryman and florist, Erfurt, together with some flowers of varieties of Aster, the following communication: "I have great pleasure to send you, by same mail, a few flowers of my new Ray Aster, which I intend to introduce this coming autumn. This novelty originated from the giant flowering Comet Aster, producing flowers of the same large size. The plant attains a height of about 20 inches, in habit of true candelabrami-growth, and bearing its large flowers on

Acanthophepperat riburmana, (K)A, affin. A. Curtisii, Robb., f). Bulbis subtetragonis 6 8 cm. longis, 2 cm. crassis sur lide purpureis; (foliis petiolatis plicatis oblongo lanceol dis acutis at 20 cm. longis, 5 cm. latus; racemo hillono (v. polius paneilloro); bracteis ovatis acuminatis cymbiformibus pellucidiscovarii pedicellati) fo (requantibus; covario purpureo Sepalo dorsali ovato oblongo obtuso, lateralibus antice ovato tri urgulis obtusis postice in pseudocalear leviter genutlexum (ovario equantibus cutter describis subteragonis postice conficiency in the sali roscopaneitulatis; petalis lanceolatis subsequilongis obtusis; labelli uregue quan ipsum longiore lineari lineis 3 elevatulis per unguen, lobis lateralibus crectis postice conorginatis semi-ovatooblongis ab intermedio late ovato-obtuso vix sejunctis linea i elevata v. crista arguta per discum, addita urtimque linea vix elevatula, toto labello flaveolo lasi parce punctulata; (1)+1) (u) urtice; gynostenio alb., anthera apiculata antice tranguli. Totus flos 4 cm. longus, 1% cm. dam.

strong stalks about 10 to 12 inches long. The flowers consist of rays of very long, slender-quilled florets, which have a charming appearance. The old types of Japanese or Needle Asters cannot be compared with this novelty for beauty. Hitherto, I have raised two quite distinct colours, viz., pure white and brightrose. This new type of Aster is likely to take the public faney, being invaluable materials for floral designs as well as a first-class acquisition for the flower garden. Other pretty novelties are the Giant Lilac and Light-blue Comet Asters, which colours are quite new." The Asters of the Ray-type have terete florets resembling some of the straight-rayed Japanese Chrysanthemums, and they are pretty and distinct. The Giant Comet Aster of a bluish-purple tint is, we believe, new as yet to English gardens, and it is a decided acquisition.

PEARS AND PLUMS AT GOOD-RICH COURT.

Being present at an excellent cottagers' show held, by the kindness of H. C. Moffatt, Esq., in the grounds of Goodrich Court, I took the opportunity my visit afforded to view the kitchen gardens, which is under Mr. Spencer's guidance. It is well known that hardy fruits are grown in Herefordshire second to none in the British Isles, and I was therefore prepared to see something unusually good at Goodrich. However, to the question, "What are your Pears like this season?" I received in reply, "Not so good as we have had them; but you must see them." On my way to the Pear-trees I passed a long wall with a west aspect, which is devoted to Plums. Here was a sight that would afford the most experienced pomologist pleasure - a number of healthy fan-trained trees, some eight years planted, admirably trained over the areas allotted to them, and all of them carrying splendid crops of fine and beautifully-coloured fruit, which were evenly distributed over each tree, and each variety was wonderfully uniform in size. I did not ascertain if they had been thinned, but concluded from their regularity and evenness as regarded size that they had. They are in considerable variety, and the following struck me as being worthy of a note. Amongst Gages, the Green, Bryanston, Denniston's Superb, Guthrie's Late Green, and Reine Claude de Bavay, were noted, the last named not being so heavily. laden as the others. This is, however, a valuable late Plum, but it requires a fine autumn and a warm situation to bring it to perfection. It may be mentioned here, that I have seen this variety in splendid con dition at Rendlesham Hall, Suffolk. Denniston's is a trustworthy cropper, and the tree succeeds under any kind of cultivation, but the fruit is, to my taste, too sugary in flavour, and inferior to Oullins' Golden, which ripens at about the same time. The fruits of Kirk's Belgian Purple and Goliath were of a very deep colour, and had a beautiful bloom upon them. For dessert and exhibition purposes the former has few rivals; the tree is also hardy, and a free and certain cropper. Jefferson was remarkably good in every point large, and beautifully mottled. This delicious Plum, like Coe's Golden Drop, requires an abundance of sunshine to bring up its colour and flavour to perfection. Culinary varieties, besides some that I have already named, were represented by Prince Englebert, Victoria, Washington, and Pond's seedling, all of which carried heavy crops. Coe's Golden Drop, and Monarch, were also laden with good crops, but they were, of course, not ripe. Monarch is a grand late Plum, succeeding well under any mode of cultivation. It is valuable for marketing and as a kitchen fruit, while, owing to its being very late, it is sometimes used in dessert. Grand Duke, a very large, oval, late variety, of a purple colour, is a companion Plum to Monarch. It is remarkable after the very dry summer to

It is remarkable after the very dry summer to see Plums so fine as these, produced on a sandy loam, without having been watered. The fact, however, of the garden being somewhat recently formed, and the borders for the trees thoroughly prepared, will account for these satisfactory results.

On reaching the Pears, which are largely grown in great variety, they were not found to be so heavily laden as the Plums, although the size of the fruits left nothing to be desired, and they are without a trace of cracking, speck, or the effects of attacks of fungus ef any kind. It may therefore be inferred that Mr. Spencer's remark referred to quantity and not quality. The trees are planted against buttressed walls, a cordon being placed upon each buttress, with herizental trained specimens between. Knight's Monarch, Van Meus Léon le Clerc, Beurré d'Amanlis, and B. Superfin had the best crops amongst the cordons; and Marie Louise d'Uccle, Beurré Clairgeau, B. Bosc, B. d'Amanlis, Durondeau, Louis Bonne of Jersey, Nouvelle Fulvie, and Winter Nelis, among those herizontally trained. These noted as carrying very fine, handseme fruits, were Duchesse d'Angeulème, Pitmaston Duchess, Beurré Clairgeau, B. Bachelier, B. Diel, Glout Morceau, Durondeau, Bergamette d'Esperen, and Louise Bonne of Jersey. A very handsome, medium-sized variety, not often met with, is Forelle, which somewhat resembles Louise Bonne of Jer-ey, but is more highly-coloured, and has rich crimson spets on the side exposed to the sun. In the fruit-room I saw fine, high-coloured specimens of Clapp's Favourite, which reminded me of the fine fruits of this variety which have been exhibited by Mr. Rivers, of Sawbridgeworth. Walls 180 yards in length, and 10 feet in height, are devoted to Pear-trees, and 100 lineal yards are furnished with Plum-trees

I cannot emit to mention some splendid fruits of Apples which were growing upon wall-trees, the varieties being Cox's Orange Pippin, American Mother, and Melon-Apple. The fruit of the last-named were especially large, and the trees quite healthy. Exhibitors of delicate varietics of Apples might with advantage imitate this practice. I find that trees of the Melon-Apple grown as pyramids, even in a favourable situation, are delicate here. It is, however, a richlyflavoured and handsome Apple when well grown, and fully deserves the pains that Mr. Spencer evidently takes with it. I cannot refrain from mentioning the fine crops of Morello Cherries upon a north wall. The trees are large, and it was observed that they had made good fruitful wood, although they are losing some of their larger branches. A similar occurrence has happened at The Hendre this summer, and is the effect of gumming. It would be interesting to know if guinning is prevalent this year Thomas Coomber, The Headre, Monmouth.

ORCHID NOTES AND GLEANINGS.

CYPRIPEDIUM SEDENI.

A LARGE well-grown specimen of this species is a handsome object, and there is now in the possession of Wm. E. Groves, Esq., the Larches, Alderley, a plant having twenty flowers fully expanded. The plant is very healthy, and is growing in a moderately warm house.

SACCOLABIUM CELESTE.

There is an unusually fine plant of Saccolabium coeleste to be found growing in Mr. Groves'stove, and showing four of its S. cervifolium-like upright spikes of flower, each flower as closely set as an Orchis foliosa. The dichetomous stem has its leaves closely packed together as seen in Aërides Lobbii, only they are shorter and stiffer. The flowers are of pure white as regards the ground, and tipped with blue; and the lip is white at the base with the lower half of it of soft corulean blue. It is a beautiful plant, in the most robust health, and its four spikes will each carry about 100 flowers.

CATPLEYA SPECIOSISSIMA, ERLSDENE VARS.

Among the recent importations of Cattleyas speciesissima have come some varieties which are superior in size, colour, and substance of flower, to the best of those we had thirty years ago. The writer described in the Gardour's Chronicle some thirty-two years ago a fine form under the name of C. speciesissima Lowii, but then it was exceedingly shy to flower, and it had not the sturdy habit of the new ones; moreover, those now under notice seem to bloom annually, and are consequently a great gam to the Luddemaniana section. Some experts tell us that

if you place the plants in bottom-heat they will flower every year. If that be so, it is a capital "wrinkle" net only for this, but for some of the shy-flowering C. gigas, of which one sometimes sees a score of plants without any disposition to produce sheatls, though in excellent health.

The Erlsdene variety (a) is in form an ideal flower, the whole of the segments overlapping, and standing upon one plane, without any disposition to curl outwards at the edges. The sepals are lanceolate, and about one half broader than the normal type; petals of great width, and the colour of a reseate-blush; in fact, the segments are concoloured. The lower pertion of the lip is of circular outline, and the ground-colour similar to that of the segments, with blotches and spots of rosy-crimson; the upper portion, or convolute half, has a pretty flesh-coloured interior, with the two sides of the tube having clouds of pale yellow. The Erlsdene variety (b) is also an exquisite flower, and if not so perfect in form as variety (a), it has a magnificent labellum. Its lower portion is of great size, and inflated, too, to abnormal proportions, showing off at the base of the tube two immense vellow blotches, the tube itself having a flesh-ground colour, with crimson radiating lines above the yellow blotches, while the lower extremity in its pale ground has dashes of crimson spots and blotches. The plants were carrying three flowers upon a spike, there being some twelve flowers on the two plants. E. J. Sidebotham, Esq. (gr., Mr. Shiner), is the fortunate possessor, and he is justly proud of them. J. A.

ORCHIDS AT VERNON LODGE.

The pretty gardens of E. Tucker, Esq., at Preston, Brighton, though small in extent, affords a good illustration of horticulture, both in the extensive displays of hardy flowers and bulbons plants ont-of-doors, and in the profusion of bleem to be found in the glass structures, in most of which Orchids are grown among general stove and greenhouse plants. The effect of the plants so arranged, and the good condition of some which are considered difficult to grow in houses solely devoted to Orchids, are equally surprising.

The cool Orchids are grown in a tolerably sunny house of ordinary greenhouse temperature, and among a line display of the varieties of Lilium speciosum, L. auratum, and others, the flowers of the Orchids at present in bloom appear. Of these, the most prominent are some very strong spikes of Oncidium varicosum, O. crispum, O. Gardneri, O. prætextum, some scarlet Sophronitis, and orange-red Epidendrum vitellinum majus, a few Odontoglossums in flower, and many more in bud, and other pretty species.

In this cool, airy house, suspended from the roof, the Mexican Lelias and Cattleya citrina grow with a vigour which would excite the interest of many who take greater pains to grow them, but meet with less satisfactory results. The whole of the plants of Cattleya citrina have been in flower, making a fine show; the plants of Ladia majalis are strong, and possess stiff hard foliage, which indicates good health in this showy but rather troublesome species. The specimens of varieties of Ladia anceps are well-furnished with flower-spikes, which will soon make a bright display. In this cool-house, too, Vanda corulea is in flower and in grand condition, the leaves being broad, firm, and of a bright dark green colour. Few Orchids have given more trouble to the Orchid-growers than Vanda corulea; and it is only occasionally that I find it in a really healthy condition, and then generally in some garden in which Orchids are not the leading feature. Strangely, too, the conditions under which the best plants are found are apparently very different. Some time ago I found a specimen of large size in fine health, which had occupied the same position at the end of a warm moist house from the time it was first imported. But in most cases of really satisfactory growth and free flowering, the conditions are as in this instance, viz., a long sojourn in a cool house during the heat of summer, and a return to warmer quarters for winter. Among other plants in bloom in the cool-house was a splendid specimen of Cypripedium Charlesworthi, with several flowers upon it.

In the warmer house a noteworthy example of good

culture was seen in a splendid plant of Oncidium sarcodes, of which when it flowered, Mr. Tucker sent me flowers and a drawing. The spike bore 184 flowers, and was a fine object. In flower here also were several varieties of Dendrobium Phalænopsis Schroderianum, Cattleya Harrisonie, with several spikes just expanding their flewers, which were white, but later become rose colour, a process which has disappointed many a novice who thought he had secured an albino; Cattleya grannlosa, C. aurea, and other Cattleyas, the rich carmine-crimson Broughtonia sanguinea, several plants of the pretty terete-leaved Angracum Scottianum, Miltonia Roczlii alba, &c. In a sunny corner of the garden a little house has been put up for Dendrobiums to ripen in, and which is now full of resting plants. The use of this little house for the purpose, Mr. Harper, the gardener at Vernon Lodge, says, makes all the difference in the health and floriferousness of the plants, J. OB.

AMERICAN NOTES.

[From our own Correspondent]

The twelfth annual convention of the Society of American Florists was held at Cleveland, Ohio, August 18 to 21 inclusive, the meetings being held in conjunction with the centenary celebration of the city. The occasion was an advantageous one for a combined national and local exhibition.

The annual convention of the Society of American Florists attracts such widespread attention, not solely by reason of its own merit, but through the fact that under its agis are held the annual meetings of the various sectional or "special" societies, i.e , those for the Carnation, the Chrysanthemum, &c.: and also that most successful institution, the Florists' Hail Association which numbers six hundred and fifty-two members, and carries risks equal to a single insurance on 8,003,820 square feet of glass. It has paid out 7,380°85 dollars during the past year. Of single thick glass, one square foot out of every 65 19534, and of double thick glass, one square foot out of every 127 1137 insured was broken. This is the largest percentage of loss that the Association had ever sustained in a single year.

The exhibition cannot be a very brilliant affair in the month of August, and is confined almost entirely to moderate-sized collections of trade stock.

Messrs, Pitcher & Manda of Short Hills, N.J., had, as their most noteworthy objects, a very pretty golden Myrtle (Myrtus communis), and Saintpaulia ionantha, a favourite plant here among amateurs. Its free-blooming quality is a great recommendation. Mr. H. A. Dreer, of Philadelphia, Pa., had Palms and Ferns, also Asparagus Sprengeri, which is likely to become a favourite here.

The groups which merited the most notice for their value and rarity were those of Siebracht & Wadley, of New York, who had excellent specimen Palms; and that of your countryman, F. Sander, of St. Albans, whose plants had travelled most satisfactorily, and attracted considerable attention from the visitors. Among the subjects shown were Draceena Godseffiana, Damonorops cinnamomeus, and Ptychoraphis augusta. A Special Mention was awarded in this case. Robert Craig, of Philadelphia, Pa., and W. A. Manda, of South Orange, N.J., also had worthy displays. The successful results of this year's display may act as an incentive for the institution of a regular annual flower show during the Convention meetings.

William Scett, of Buffalo, presided at the meetings, and in the course of a lengthy address urged upon the younger members of the profession the necessity of, at all events, a reading acquaintance with chemistry, geology, botany, &c. The florist of America is already far in the vanguard of selentine application to his business. One his only to read our horticultural press to see how very intelligently are discussed such things as the use of Bordeaux Mixture, Paris Green, carbonate of copper, &c., for the destruction of insect and fungous pests, and not only in the orchard but in the greenhouse and backyard, and in all truth it is a natural outcome of circumstances.

Botanical gardens were also eulogised as educators; the only weak point here is, that there are so very few such gardens, even so called, and some of them—well——!

The President elect of our national society, and who will preside at next year's session, to be held at Providence, Rhode Island, is Adam Graham. He, like his predecessor in the chair, hails from the "other side," but his native heath cannot be allowed much more than the record of his birth. Adam Graham was born in Fifeshire, Scotland, in 1840, and came over here when but a "wee laddie" of nine. Commercing his horticultural career in Philadelphia, he went to Cleveland to take charge of the grounds of Mr. Wade, donor of Wade Park, and subsequently started in business. He is a man of energy, and will undoubtedly well fulfil the duties of his office.

A MEDICINAL CACTUS.

ANHALONIUM is a small genus of Caeti of somewhat anomalous character. It was founded by Lemaire in 1839, but the authors of the Genera Plantarum reduced it to a sub-genus of Mammillaria. Recently Mr. J. M. Coulter, an American botanist, in a Revision of the North American Species of Cacti, shows good reasons for restoring the genus Anhalonium, and placing under it four species, viz., A. Engelmanni (Mammillaria fissurata), A. prismaticum (M. prismatica), A. furfuraceum (M. furfuracea), and A. pulvilligerum (A. elongatum). These four plants closely resemble each other in their short, fleshy, top-shaped stems, and flat-topped rosette of thick, fleshy, wrinkled, grey-green tubercles (leaves), which look like vegetable warts. The plants are quite different from a fifth species, which Lemaire at first (1845) called Echinocactus Williamsii, and in the year following removed into Anhalonium. Mr. Coulter makes a new genus for this plant, viz., Lophophora, a name which is scarcely likely to find adoption am mg gr wers of Caeti in this country, to whom Anhalonium Williamsii, the Dumpling Cactus, is well known. There is a good figure of it in the Botanical Magazine for IS47 (t. 4296), when a plant with four heads, received from the Real del Monte Company from the rocky hills of their district of mines in Mexico, flowered in the Succulent-house at Kew. There are now good examples of this Cactus at Kew. Single-stemmed plants are Carrot-shaped, 1 inches long, 11 inch across the top, the whole brown, wrinkled, and apparently shrunken, except the cap like top, which is fleshy and dumpling like, grey-green, marked with radiating creases, and bearing a few small seattered tufts of woolly hairs with a large tuft in the centre. The flowers spring singly from this central tuft, and are star-like, 1 inch across, the petals narrow and coloured white

According to Mr. Coulter, wild plants are often densely proliferous, forming hemispherical tufts in Texas and Mexico, where this species is a native. This Cactus has no claim to decorative qualities, but from its peculiar shape it appeals to those whose tastes are gratified by the grotesque among plants.

Hitherto we have known it only as a garden curiosity, but it appears to possess extraordinary medicinal properties, for which it is greatly valued by the American Indians, and which, if report speaks correctly, is likely to lead to its being valued by their more civilised brethren.

A small brochure, containing the reprint of a paper from the Therap ntic Greeth (America, for January, 1896, sets forth the medicinal properties of this Cactus, or rather a variety of it,* under the title of "Mescal Buttons, their therapeutic uses," by Doctors Prentiss and Morgan of Washington. The Indians have long regarded this plant as "a panacer in medicine, a source of inspiration, and the key which opens to them all the glories of another world. They consider it panticularly effective in homographic and consumptive diseases." They also use it for fevers, locate thes, and chest-pains. "I have also seen an

Indian eat one between meals as a sort of tonic-appetiser. . . . I know from experience that the "mescal" is a powerful stimulant, and coables one to endure great physical strains without injurious reaction."

The conditions in which it seems probable that the use of mescal will produce beneficial results are nervous headache, nervous cough, abdominal pain due to colic or gripiog, hysteria, melancholia, &c. ; it is also recommended as a substitute for opium and chloral. The medicine is prepared as follows:-a quarter of a pound of the plant is put into a jar containing 1 pint of alcohol and 1 pint of water, and allowed to stand for ten days or two weeks. It is then ready for use, a teaspoonful at a dose, at intervals, as the case requires. "The production of visions is the most interesting of the physiological effects of anhalonium. The visions ranged from flashes of colour to most beantiful figures, forms, landscapes, dances, &c." These visions are said to be due to the stimulating effect of the drug on the centre of vision in the brain. This rather suggests an attack of delirium tremens, or the effects of opium!

Although called Mescal, or Mescal Buttons, by the Indian traders, this plant must not be confounded with the mescal of the Apaches, an intoxicating drink obtained from the Agave.

The Indians of the southern plains regard this plant as the vegetable incarnation of a deity, and the ceremonial of eating it has become a great religious rite with them. Mr. James Mooney, of the United States Bureau of Ethnology, records the results of investigations made by him of the use of mescal by the Kiowa Indians. The early missionaries condefined its use as a crime, without result. "In spite of its universal use, and the constant assertion of the Indians that the plant is a valuable medicine, and the ceremony a beautiful religious rite, no one had ever tested the plant or witnessed the ceremony." Mr. Mooney, however, has done both, and is preparing a detailed account of all that he learnt of mercal, to be published by the Bureau of Ethnology, He gives a brief account of it in this brochure, from which it appears that the Indians meet usually on Saturday nights, and seating themselves in a circle round a fire, enjoy a feast of mescal for from twelve to fourteen hours. They eat the dried stem of the Cactus to the beating of drums and singing of songs, adding a drink of water. This is followed, by parched corn, rice, fruit and dried meat pounded up with sugar; then more mescal, when each man eats as many stems as he can, some eating ten or more at once. Cigarettes are then indulged in. Noslcep is taken, the stimulating effect of the mescal being such as to make sleep unnecessary. It is not an intoxicant, and it has no aftereffects or reaction of any kind. Mr. Mooney ate seven of the stems, and found them extremely disagreeable to the taste and nauseating, although their effect upon him satisfied him of the truth of what the Indians say of its mental effect. From this it would appear that in Anhalonium Williamsii we have a drug or stimulant which combines all the pleasures derived from the use of quinine, opium, morphia, champagne, &c., without any of their ill effects. H', W,

SCOLOPENDRIUM CRISPUM.

(HOW TO PROPAGATE IT IN QUANTITY.)

It is a thousand pities that this beautiful variety. or rather group of varietics, of our native Hartstongue is not in greater vogue as an evergreen decorative foliage plant, since nothing can form a handsomer ornament in a window or well-lighted corner than a good specimen of this charmingly frilled, and it may be, tasseled, Fern. The lustrous bright green fronds of the normal plants are in this variety transformed into deep ruches of emerald ribbon, the plain edges being even in some of its best forms transmuted into fine lacy-looking limbriations, and the tips, in the rarer crested varieties, being decorated with widespreading tassels. One reason, undoubtedly, and probably the main one, of the rarity of these plants under domestic culture, is their usually barren nature. An atter absence of spores characterises most of the

forms, but it is the object of this article to give a "wrinkle" not generally koowo, by the aid of which the spores can be dispensed with, and very large numbers of plants may be raised with greater ease, certainty, and rapidity, than by their mediation This is the method of raising from the bases of the old fronds, a method which, though long known as possible, and even mentioned in a few Fern-books, has never, to my knowledge, been so explicitly set forth as to convey a fair idea of the facility of the operation, and the certainty of its results. In point of fact, the material used is so unpromising in appearance, that few cultivators to whom the method is new, accept it as likely to yield a crop. Starting without faith, sooner or later they neglect the trial culture, and nothing therefore results. If however any of my Fern-loving readers will follow carefully what I am about to describe, and the course I find invariably successful, they may depend upon achieving like results. If we take up an old plant of the Hartstongue species, shake off the soil, and thoroughly wash the roots, we shall find a well-developed rootstock probab'y 2 or 3 inches in length, and about 11 inch through. Cutting away with a sharp knife or scissors all the root fibres, we shall then see that this caudex is built up of a narrow central core to which is attached, closely packed together, a very considerable number of somewhat sausage-shaped blackish-green bodies, each about \$\frac{3}{2}\$ inch long. These as we shall next perceive by examination of the upper ones are nothing more or less than the persistent bases of the old fronds which have run their course, died down, and rotted away, leaving however always their small individual contribution to the root-stock as described. From the lower part of each of these basal portions it will be seen that two or three roots spring to add their quota to the general sustenance of the plant, and by cutting one of the bases across it will also be manifest that their vitality is maintained for some years after the death of the frond of which they originally formed a part. It will also be obvious that the roots also retain their contributory powers for an equal period, and that the plant is not dependent solely upon those freshly emitted each season from the bases of the new fronds. We have now seen the raw material from which we shall derive our crop, but here even the more experienced Fero-grower is apt to look dubious, for he will be utterly unable to detect the slightest evidence of bud or bulbil growth upon these bases, and failing this, his faith is likely to be a minus quantity.

We will, however, proceed now to consider how to treat this candex, with a view to the greatest crop it can be made to produce; and commencing at the lowest, i.e., the oldest portion, we shall find that each sausage-shaped base can be pulled off from the central core, and, the root-fibre having been already trimmed, will only bear the stumps of its own particular set. Pulling these bases off one by one, we shall find quite a heap of several score resulting before we reach the top, and consequently arrive at the fronds themselves. This top, which is really the growing crown, can be installed in a small pot, and will speedily form a good plant again, so that we are not even the losers of the original by the drastic surgical operation we have performed. We now take each base as detached, and cut it with a sharp knife through the middle, i.e., across, making two pieces of it, or, if the plant be very robust, even into three, each piece being about a quarter or one-third of an inch long. From this one caudex, therefore, we shall probably have fully a hundred pieces, quite possibly many more; a hundredfold, however, is not a bad crop, especially of a barren Fern, which is usually simply halved or multiplied by two. We have not, however, done with these figures, as we shall see auon.

The next step is to plant the material, and for this purpose we will take a shallow 9-inch pan, fill it with well duained, open compost, topped with a little extra silver-sand. See that no worms or other vermin are present; in fact, it is best to scald the soil with boiling water, as if for spore-sowing. Let it cool, and then gently insert the basal pieces perpendicularly about three-quarters of an inch apart, or a trifle closer, so that their tops are flush with the

^{*} Plant of this variety called Lewing, Litely received at Kew, show no difference from the type.

surface. It is immaterial which end is upwards. Cover with glass, and put away in a cold frame, with plenty of top-lights, but no sun, or very little, and wait results. In five or six weeks in the spring or summer every one of these pieces will reveal several whitish dots, some on the surface of the cuticle, and some actually on the cut edges. These whitish dots in another week, or so will develop into tiny fronds, each dot an independent plant. Before long a little clump denotes that these plants have rooted, and if the cutivator is greedy, and his raw material scarce, he may lift each little clump of plants, carefully pick them off the still green base that bore them, instal then

as the great exposure of the internal tissues saps vitality considerably. It is as well to wash the bases clean before insertion in the soil, as naturally any attached Conferva or Marchantia finds a congenial home in the fresh soil, and will soon invade it, and although this will not hinder the bud development, it will affect that of the young plants, and hence growth of this class must be kept under if it appears.

So far we have only treated of S. v. crispum, since it is, as we have said, usually barren, and does not lend itself like fertile varieties to propagation in quantity through the spores, but any robust variety

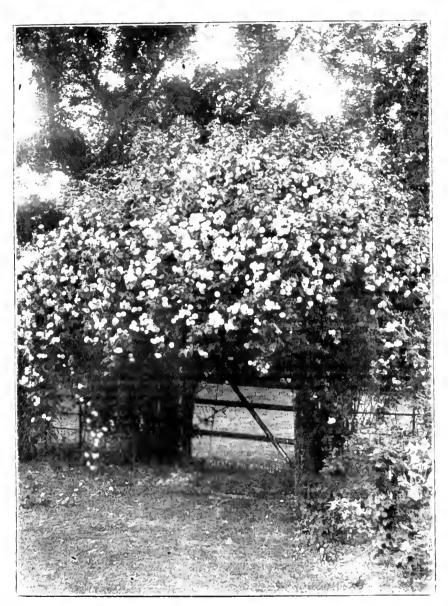

FIG. 50.—GATEWAY WITH ROSE GROWING OVER IT, IN THE GARDENS OF WALKER, ESC.
PERCY LODGE, WINCHMORE HILL. N

in another pan, replace the basal bit, and in al probability get some more from them later on, the buds being often too numerous to develop altogether. Now it is manifest we have our plant, barren as it is, and unpromising as the material appeared at the start, multiplied not merely one handred, but several hundred fold, the number indeed mainly depending upon the care and patience of the cultivator. Mr. E. J. Lowe sent the writer a single frond of a very fine crispum in a letter, and although but a small portion of the base proper was attached, ten plants resulted from it. Every piece indeed seems capable of developing these buds, even pieces of the central core possessing the faculty. The bases may be divided longitu hually instead of across, and will even then yiel (but a ong the edges; this, he wever, we do not achie-

may be treated in the same fashion with like results, with the advantage of true progeny being obtained. To this we have only met with one exception, a carrious constantly cornate form found by Mr. Workston's son, yielding nothing but normal Hartstongues, both by basal cuttings and spores. We raised quite a host of plants both ways, with the same result. It must be mentioned here that it is only the bases that are utilizable in this way, there mainder of the stalk of fronds actually in existence will simply rot away, the capacity for bud production being confined to that portion which is perennial.

As it is very unlikely that this property is confined to the Hartstongue, though hitherto we have failed to establish its existence in any ther British species, we think experiments with some of the exercise species.

which form similar candices might be attended with good results. The fleshy scales of some of the Marattias, situated at the bases of their fronds, have been found by Messrs. Veitch to develop" buds of similar character, though we believe for levs freely. In making cuts through the fleshy eaudex of Asplenium Adiantum nigrum we have observed buds to form on the wound, though we have failed with pieces detache ! from the root-stock. Many species, such 'as the Polystichums and some of the Lastreas, have the same power to a certain extent, but with some limitations, and in these cases dissection usually shows that a latent bud is already in existence, where activity is simply stimulated by the energy directed from the central axis of growth by some check to to development.

So far, then, the Hartstongue stands alone in its capacity for forming buds or bulbils, ad libitom on detached pieces of rachis deprived altegether of next stimulus, the stored-up energy of the cells sufficing to generate such outgrowths at any part of the surface as described. Chas. T. Divery, F.I.S.

PERCY LODGE, WINCHMORE HILL.

THE fretty suburlan garden around the reside con F. W. C. Walker, Esq., anthough evidently it was 12.3 hid out on any pre-arranged plan, alounds in pretty views and charming nooks, and is in every way letter Slapted to form a pleasant place for the recreation & the owner and his large family than a garden of a more conventional style would be. Charling plants abound both upon and around the house, and pretty little gardens, shut in by tall shrubs, which must have I cen planted many years ago, form suitable places for different classes of Lerbaccous perenaials, some ce other of which are constantly in blocm. In spring, among other handseme objects, were two large bedf Auriculus planted in a south aspect, and which Hoomed a fortnight Cearlier than those in other parts of the garden; and beneath the fine weeping Ash, under which a large quantity of Crocus were plants ! four years ago, was a bailliant display.

In another part of the garden the Hencysuckle 'odge, with two arches in its length of some 60 feet, is a charming sight, being literally covered with irngrant flowers. Every year it is trimmed back with hears, and the result is that the whole becomes in its sessen a dense and leantiful bank of flowers. Similar effect is obtained on the several Rose suches, one of which, covered with Dundee Hambler, leading to the paddock, we here illustrate (see fig. 50). In the centre is a small piece of erramental water with rockery margin, planted with various plants, and rnamented by Cacti and other succulents, which are removed to the greenhouse before winter. Around are borders of mixed herbaceous perennials and annuals, such as Salpiglossis, Coreopsis, Sweet Peas, Ac.; and overlooking this pretty nook is one f those pleasant little summer-houses with which the place abounds. Another portion of the garden is devoted to fruit-trees, but here also are there flowers of Carnations, Phlones, Pentstemons, &c., with here and there the rich violet-purple thats of the Clematis, trained on arches and pillars.

On the outside of the garden, near the paddock, is another arrangement of beds and borders, the centre of the largest being occupied by a very Landseme example of Heraeleum giganteum (see fig. 51) some sfeet in height, and the same across. The plant is very easy to enlive ate, and if space can be given it, will form one of the most striking objects in the wilder part of the garden in the early part of the year.

THE GLASS HOUSES

consist of a neat block, chiefly arranged for the culture of Orchids, which are grown at Percy Lodge with much success. Everything that forethought can suggest is provided for the comfort of the plants, one of the latest and most satisfactory additions being the lath roller blinds, which have been fitted to the houses containing the varieties of Ladia anceps, and other Lælias and Cyttleyas. These, it is found, are great

aids to Orchid culture, as they admit the maximum amount of light, and tend to keeping an even temperature as low as possible in the hot weather. Notwithstanding the very hot summer, a single spot only on the leaves under these lath blinds has been observed, and that, probably, was done instantaneously, in consequence of a blemish in the glass. In the Cattleva-house was a fine show of C. Mendeli. C. Gaskelliana, C. Warscewiczii, and C. Mossia, one fine specimen of the last-named having nineteen flowers. Also in bloom here were several good forms of Leelia crispa, one specimen having twelve spikes not yet open; three plants of the large, handsome fringed L. Diglyana, several fine plants of Cattleya eldorado, Cypripedium Curti-ii, C. Godefroyae and C. G. leucochilum, C. Lawrenceanum, C. Chamberlainianum, Epidendrum rhizophorum, and other pretty species; and here. too, suspended from the roof are some vigorous specimens of Odontoglossum Londesboroughianum, which is not one of the easiest plants to grow and flower annually as it is done at Percy Lodge.

In the cool-houses the many specimens of Odontoglossum crispum are in fine condition, and some good varieties of it and O. Pescatorer and other species are in bloom; so also some showy Masdevallias, Oncidium macrantham, O. phymatochilum, O. crispum, Epidendrum vitellinum, and the yellow Lycaste aromatica, &c.

In some of the smaller warm-houses the plants of Dendrobium Phalanopsis Schroderianum are growing splendidly, and the few specimens of species of Phalænopsis are more satisfactory than is usually the case in gardens. Some of the Dendrobiums have made a remarkably fine growth, and even the reputedly difficult D. McCarthia, which is here now beautifully in flower, well responds to the efforts made to grow it to perfection. Disa grandiflora, and the other species of Disa, which some consider the easiest things possible to grow, are here found the least satisfactory; probably because they are grown too much like Orchids, and too little like ordinary greenhouse plants. A change on these lines has proved successful in many cases, and is to be tried at Percy Lodge.

In one house Gloriosa superba annually makes a great and lasting show of searlet and yellow Lily-like blooms. In others, the Begonias, Gloxinias, Streptocarpus, &c., are good, and everything about the place is in such perfect order as to suggest a goodly number of assistants; but the truth is, that Mr. Geo. Crazz, the gardener at Percy Lodge, secures the good results to be seen with but very little aid, and by sheer diligence, skill, and an unbounded liking for his charge.

The show of the Winchmore Hill Horticultural Society was held in the grounds of Percy Lodge this season, and Mr. Crazg won the greatest aggregate of prizes, and the dinner-table decoration of Roses arranged by Mrs. W. C. Walker was the centre of attraction in the tent of floral decorations. J. O'B.

BOTANICAL DRAWINGS AT THE NATURAL HISTORY MUSEUM.

Tur series of prints and original coloured drawings ot plants stored in the Herbarium of the British Museum at South Kensington are known to but few persons. The series is of much historical interest. consisting, as it does, of specimens of the work of many distinguished botanists, and of the chief botanical artists of the period, from the middle of the seventeenth century to the present time. Hitherto the general public have remained unacquainted with this collection of pictures, although students furnished with proper recommendations have enjoyed access to them for purposes of research and scientific investigation. It is, therefore, satisfactory to learn that an opportunity has been found to enable visitors to the Natural History Museum to inspect some, at least, of the more interesting and beautiful of the drawings. Mr. G. Murray, the keeper of the Department of Botany has, with the approved of Sir William Flower, arranged a temporary exhibition of water colour drawings selected from the collection.

It is intended to change these from time to timeto avoid injury from exposure to the light, and also with the object of exhibiting in course of time the most valuable part of the series.

Of the more noteworthy drawings at the present on view, are the examples of the work of the brothers Francis and Ferdinand Bauer, natives of Feldsberg, in Lower Austria. Francis, the elder, came to England in 1788, and was induced by Sir Joseph Banks to remain as draftsman at the Royal Gardens, Kew, his generous patron defraying the salary and providing for its continuous in his will.

Francis died in 1841, and is buried at Kew Church. His drawings of the plants at Kew become the property of the British Museum. Ferdinand Bauer accompanied Dr. Sibthorpe to Greece in 1784, and spent several years in England completing drawings of plants made during the journey.

In 1501 he went with Captain Flinders in the Invistigator, as natural history painter to the expedition for the survey of the coasts of Australia, Robert Brown going as naturalist; and Bauer and he, remained some time in Australia, working on the flora of that country after Flinders' return to England. Among other artists whose work is shown. George Dionysius Ehret stands shigh. Nor should we omit to mention the name of James Sowerby (1757-1822), who is best known for his great work on English botany, and whose collections of plants form the basis for the largest and most interesting public herbarium of British plants. Sowerby's collection of models of British fungi occupies the first case to the right as you enter the public gallery of Botany. In connection with these models, mention must be made of another botanical artist, who is still with us, Mr. Worthington G. Smith, who has coloured and mounted in a successful manner, Sowerby's models, and who shows accurately-coloured drawings of native

DRY-WEATHER BEDDING-PLANTS.

Where a number of bedding-out plants are annually required, especially in districts where the rainfall is light, it is well, in view of the dry springs and summers, a cycle of which seems to have set in, to select, as far as may be convenient, some plants of a nature that make a fairly free growth, and afford the greatest quantity of flowers under dry, warm conditions. The present season has been unusually dry, little rain having fallen in southern districts from the end of March to August 18; therefore, those subjects that had grown and flowered satisfactorily previous to the latter date may be appropriately termed dry-weather plants. The following comprise some that have grown and flowered more freely this summer than the various bedding Pelargoniums, and the majority are easily raised from seeds in spring.

Double Zinnias.—I think the foremost place may be accorded these plants, as the beds have been a mass of bright bloom for many weeks past, and that without receiving any artificial watering. A bed filled with a mixture of bright coloured Zmnias is very effective, especially when the strain is a good one, and the colour ranges from scarlet, crimson, and magenta to white. If seed of Zinnias be obtained from a trustworthy source, the varieties come very true to name. and quite double. The dwarf or Tom Thumb type of Zinnia, growing only to 6 or 8 inches high, is a useful plant for small beds, &c. The small amount of labour Zmniss require is much in their favour. My practice is to sow the seeds, in the second week in April, on a bed of light soil in a frame placed on a mild hot bed made of tree-leaves, and transplant direct from the bed, after due exposure, about the middle of the month of May.

Verbenus from seeds sown in pots or boxes in March, and pricked off into boxes as soon as large enough to be hundled, make excellent dry-weather bedding-plants, especially if they can be planted out early. The plants are not injured by a slight frost, when they are duly hardened off before transference to the open ground. Beds of mixed Verbenas of a good

strain are very effective in the flower-garden, and beyond some small amount of pegging down in the early stages of growth, the plants require but little after-attention.

Gaillardias of the picta Lorenziana type may also be raised from seed, and treated similarly to the preceding. They make quick growth, and in the hottest weather will flower profusely. The flowers are useful for cutting. Single Petunias are certainly dry-weather plants, but have a bedraggled appearance after heavy storms. During the recent hot weather our beds of mixed single-flowered Petunias were very showy and effective.

Antirrhinums, planted in a pair of beds in the Dropmore garden in a dry and rather shady position, where bedding Pelargoniums were always unsatisfactory, are this year very fine. The plants consist of a selected strain raised from seed: they bear flowers of crimson colour, and attain the height of 15 to 18 inches. The seed from which these plants were raised was sown about the end of the month of March, the seedlings pricked off into boxes when large enough to be handled, and planted out in the beds in the month of May. They grew rapidly, and for some time past have been a mass of flowers of one colour. They will continue in bloom for a long time yet, and are but little affected by either heavy rainfall or extreme drought.

Although the African Marigold is all but banished from many gardens, it is a very telling subject in a dry season, where a mass of colour is required, and is admirable for filling large beds, or planting in masses. Our plants have been full of flower for some time, and although they received no water after once they were established, they have not suffered in the least by the continued drought, but revelled in the sunshine, growing to a height of about 2 teet, and flowering profusely. We treat them in the same manner as Zinnias.

Ageratum corruleum and the several dwarf varieties are remarkably full of flower, such as can only be obtained in a hot and rather dry summer; it is, therefore, one that should be planted in dry soils.

Isotoma axillaris, a Lobelia-like plant, now but seldom seen in gardens, attains to greater perfection in a hot summer than a wet one. The pale blue flowers, somewhat like those of a large Lobelia, are borne on rather erect stems: the foliage is also attractive. R.

METHODS OF PROPAGATION.

(Continued from p. 213.)

BUDDING FLOWERING TREES AND SHRUBS.—The red-flowered Horse-Chestnut (Æsculus rubiennda) can be budded with ease on the common sort, this being the usual plan in nurseries, while all the Pavias may be put on this stock, the summer flowering P. californica, making, thus treated, a very pretty lawn tree.

Among flowering trees few exceed the Double Cherry in beauty. If any of your grafts have failed, you might utilise the stocks by budding them with the double-flowering Morello, or Waterer's fine large-flowered kind; but if you can get some buds of the new Japanese rose-flowered sort, named after the famous traveller, Von Siebold, do so, as it is a very fine variety, of which all gardens should have a tree. Be careful to mark these distinctly, or perchance one or two may be planted in the orchard in mistake, which will lead to disappointment, as, of course, no fruit is obtained from double-blossomed varieties.

The common Catalpa (C. syringaefolia) is a very striking flowering tree, and there are some very distinct florists' varieties—the best, perhaps, Van Geert's golden-leaved sport, for handsome foliage; and for blossom few trees exceed C. speciosa, which produces flowers almost as large again as the species and makes a noble and attractive tree. Both these forms may be builded on C. syringa folia, as may another grand and vigorous kind, C. Bangei.

The ornamental Crabs have been taken under the head of grafting, but should any of the grafts have failed, buds should at this season be inserted in clean stocks; the buds may be inserted in the laterals, close up to the main stock or in that itself, if it be young and

free. If you can precure a few buds, do not omit to put in one or two of Parkman's double flowering Crab, by far the handsomest of all that showy tribe. This may also be budded on the Paradise stock, on which it forms a handsome bush, and when in flower proves a most attractive object.

Of shrubs requiring a warm sheltered spot, and therefore not so generally useful as some others, there are the double-flowered Chinese Peaches, which may be budded, like the fruiting kinds, on the Mussel or common Plum steek. Both the pure white and purple flowered serts are worthy of culture, though

useful for forcing if potted in 10-inch or 12-inch pots. but should be taken into a cool house as soon as they show the pretty eoral colour in their buds, or they show the precess : last but a short time. The Lilae

is so highly esteemed in France that it has become quite a florists' flower, and the varieties have multiplied in a bewildering manner. Mons. Lemoine, of Naney, sent out the first really good double-flowering variety, named after bimself, and since then, one he has called Madame Lemoine. The first has rosy lilae inflorescence, and the latter is pure white. The

allowed to run up into standard trees, a method of treatment which suits them best, as when planted in belts or borders, at intervals, they serve to break the monotonous line so often marring the beauty of sich plantations.

THE TREE HOLLYBOCK.

The handsome flowering Tree Hollyhock (Hibisous syriacus) has also been improved by the French florist. and now there are numerous kinds, each and all f which should be budded low on the common singleflowered form. The single kinds are useful, too, especially a pure white one, "Totus albus." (See Gardeners' Chronicle, August 22, p. 227.)

Dogwoop.

The species of Cornus are useful as covert trees, and since Mesers. Lee introduced one called "clegantissima," they have given us many bright-foliage l shrubs, some of which are unique in their colouring. All may be budded low on the common Dogwood, Cornus mascula, any time during the summer when the sup is active, both in stock and bud-parent. C. elegantissima is still the best, and Speth's golden form is o useful companion plant, but they should have a -hady position in the shrubbery, as hot, direct sum is apt to search the leaves, due to the absence of chlorophyll therein. Budded high and grown is pots, they may be gently forced, and then are weithy subjects for the cool conservatory.

DAPHNES.

The deliciously-fragrant Indian Daphne may be increased by budding either on D, laureola (the Spinger Laurel) or D. Mezercum in the open ground, but in the north of the country they need protection during the winter. In the south, both it and the white form are bardy upon warm walls or fences.

MOUNTAIN ASE.

The useful forms of Mountain Ash are propagate ! by budding into the ordinary species. For variety, few of the yellow-fruiting kinds may be budded in young trees of this, but if a really handsome lawntree is required, work the variety called hybrida, which is an erect, close grower, with handsome cut foliage, flowering later than the species, and prolucing bright scarlet fruit like it. Of weeping forms, Dawson's is the most satisfactory. All the Sorbus do best on rather poor soil of a calcareous nature,

THE TRAVELLER'S REST TREE

(Viburnum lantana) is common in most parts of England. This may be raised from its red berries and it forms a stock for the fine-flowering Japanese variety (V. plicatum), and also for the similar variety from China (V. macrecephalum). Both should be builded low down on the ground-line, and the stock headed-back in the spring. Another kind only lately in commerce (V. dilatatum) may be budded on the same stock, and it forms a useful addition to ornament A fruiting-trees. Experience.

(To be continued).

NEW MELON DISEASE.

A CORRESPONDENT ("H. C. T.") has sent us Melonleaves, with the following note: "Up till a few weeks ago the plants were healthy and doing well. Then a few spots appeared on one or two of the leaves, afterwards spreading over the whole until there is not a healthy leaf left, and the fruit only a little more than half-grown. I have had them similarly affected in the same pit for several seasons, but not so early." The leaves are blotched with greyish spots from 1 inch to 2 inches long, and upon these spots, on the upper surface, a black mould flourishe. The hyphic are very long, creek, straight and slender, of a dark olive colour, so that the serta are very inconspicuous. The conidia are quite three times as thick as the hyphe, but colourless, 80 micromillimètres long by 8 micro-millimètres thick, attenuated a little toward one end and rounded at the other, at first multi-nucleate, and then many septate. This mould may only prove to be a variety of t'ercosport citrullina (Cooke), Grecillea, xii., p. 31, or possil'y a distinct species. The latter is found upon leaves of Citrullus in the United States, and in that case the

Fig. 51.—HERACLEUM GIGANTEUM, IN GARDENS, IFRCY LODGE, WINCHMORE HILL, N. (SEE 1 269.)

they are rather stiff and inelegant in appearance, but this cannot be said of the variety Hancei, which has small and pendulons branches, which become covered in spring with conspicuous flowers.

PLUMS.

While we are speaking of the Plum stock, there are some very desirable flowering Plums that may be propagated. First place must be accorded to Prunus triloba, which produces an abundance of bright rose-coloured flowers early in the spring, and may be budded low for dwarf plants and potting purposes, or standard high upon strong Mussel or Brompten stocks. The double white Chinese Plunc (Prunus sinensis) may be budded on the same stocks, but it is too tender to be worked high. Both are

advantage possessed by the double flower is in its longer persistence, which has been very marked this season. All the varieties may be budded freely on the common Lilac, and buils may be put on some of the strongest suckers that always are present round established bushes. If lifted in the autumn, when the bud is resting, and planted where required, they are little trouble. Among single kinds, a great ad vance in the well-known Charles X , is Souvenir de L Spath, having large individual flowers of very bright red colour approaching scarlet; and if buds can be had of this, it is well worth attention.

Among novelties, the vigorous, late-flowering kindfrom Japan, Syringa Japonica, and another from those interesting islands, with downy, young spring shoots S. villosa', should be budded now, and may be spots are smaller and the conidia longer and much more slender, so that probably that upon Molon-leaves will ultimately have to be considered distinct, with the name of Cercospora melonis. M. C. C.

BELGIUM.

SALIX SERICEA PENDULA.

This variety, which I mentioned when speaking of the nurseries of Plantières les Metz, is so named by horticulturists because when it is grafted as a standard it has pendulous branches, forming a pretty little weeping tree; it is no other than S. sericea, Willd., a European species. Its other synonyms are Salix glauca and S. appendiculata.

STAPHYLEA × COULOMBIERI.

This is now showing fine branches covered with numerous white racemes, differing much from those of other Staphylea. M. Coulombier has grown this fine shrub since 1872. He received a plant from Segrez, where M. A. Lavallée cultivated it, and where it no longer exists. Its origin is unknown. It is named after M. Colombier, who has successfully propagated it. This species has the advantage that the plants flower when very young. I remarked at the time of my visit to Plantières that S. colchica and S. Coulombieri had been frozen to the ground in the winter of 1894-5. The latter variety flowered abundantly this year, while S. colchica did not bloom; S. Coulombieri should, therefore, be more adapted to forcing than S. colchica. Ch. De B.

CULTURAL MEMORANDA.

HYDRANGEA HORTENSIS.

Ir cuttings of mature wood be struck at this season, the plants will bloom well the following spring. The cuttings for this purpose should be strong, with a firm terminal bud, and should be cut below a pair of leaves, inserted in small pots filled with sandy loam and leaf-soil, and kept plunged in a gentle warmth till roots are emitted, but on no account should growth at the top he excited. When rooted, the plants should be stood in the open air, or on shelves fully exposed to sunlight, so as to insure thorough ripening. After the leaves have fallen, very little water will be required throughout the winter. Stand the plants in a cool position till February or March, when they should be well watered and repotted, if this be thought necessary, and afforded a slightly higher temperature. If large bushes are wanted, the bloom-buds should be kept pinched out till the plants have reached a desirable size. Cuttings taken during the growing season root readily; but these will not flower the first season afterwards, although they soon make big plants, and flower well the following year. H. Markham, Mereworth Castle.

THE WEEK'S WORK.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

PINES.—The present is a suitable time to pot-up a quantity of suchers from the old stools that have ripened or are ripening their fruit. For potting-compost use a good sound loam from an old pasture or deer-park containing plenty of fibre. This should be pulled to pieces by hand, and the rougher portion only made use of. Add to each 2 bushels of loam, an 5-inch potful of fresh bone-meal, and pot firmly. The largest suckers may be put in 7-inch, and the smaller ones in 6-inch pots. Plunge the pots into a bottom beat of 90° to 95, and keep the atmosphere of the house rather close and moist for a time, shading the plants for an hour or two each day during bright sunshine until they have rooted and commenced to make growth, when shading must be discontinued, and more air given. If the soil is moderately moist when used, the plants will not require watering till rooting has taken place, but a light spraying overhead may be afforded

occasionally during bright weather. Give the plants more headroom as growth advances, or they will become drawn and weakly. Succession stock is now growing freely, and as the amount of sun-heat is daily decreasing, care will be necessary to prevent the growth becoming soft and drawn. Maintain a drier atmosphere, and give a slight increase of artificial-heat; syringing may be done only occasionally, and then early in the afternoons of fine days. Afford water only when absolutely necessary, and then let it be sufficient to saturate the soil thoroughly, occasionally using weak liquid-manure, or guano-water in a tepid state. Maintain the bottom heat at 85° to 90°, and atmospheric heat at 70° to 75° by day withent sun, and ventilate freely when the weather is favourable. During the present month sufficient soil for next year's potting should be collected and stacked. The turf 3 or 4 inches thick from an old sheep pasture or deer park is generally the best, and this should be stacked grass downwards, with the top ridged to throw off the rain. Smooth Cayennes and other winter-fruiting sorts will now be swelling their fruits, and should have every attention. Damp down when dry with weak guano-water, and keep a moist atmosphere. Sprinkle the foliage and surface of the plunging material occasionally when the house is closed after a bright day, but avoid wetting the crowns or letting water lodge in the axils of the leaves. If the soil should be getting low in the pots, top-dress with rich fibry loam. Close the house sufficiently early in the afternoon to allow the heat to rise to 85° or 90° with sun, and allow a night temperature of 70°. Plants which have fruits now colouring will be best placed in a structure by themselves, where they can have a freer circulation of air and be kept rather cooler. Plants that are intended to commence fruiting early next year may be selected from those started in the spring, and placed where they can be rested for some six or eight weeks. Allow them just enough water at the roots and atmospheric moisture to keep them healthy, and reduce the heat gradually to about 65° at night. In a few weeks they should be in a comparative state of rest. Ventilate freely whenever the weather is favourable.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gardener, Woodside, Darlington.

WINTER-FLOWERING PLANTS should now be shifted into the pots in which they will bloom. They may then remain a month or so longer in the pit or frames in which they have been kept through the summer, before they are removed to shelves indoors. Those in Peach-houses, provided they are near the glass, are well suited previous to their commencing to bloom.

bloom should be placed indoors, where the flowers will develop better and be much cleaner than if they be allowed to remain any longer out-of-doors. The plants may be fed with liquid manure liberally at this stage.

MONTBRETIAS.—If desirable, these may be lifted in clumps from the open when in flower, and potted up for use in the conservatory. They should be more largely grown for this purpose, so useful are they.

FUCHSIAS.—Give the plants some diluted liquidmanure from the farmyard at each alternate watering; it will help them to continue to bloom, and remain vigorous for some time longer. Plants that were struck in the spring for late-flowering, and that need to be reported, should be attended to in this respect at once. Discontinue pinching the shoots, and allow the plants to flower.

PLANTS FOR SPRING FORCING, ETC., such as Azaleas, Rhododendrons, and Deutzias, that have been turned out-of-doors into a shaded position, may now with advantage be fully exposed to the sun; every encouragement should be given them to become thoroughly matured.

POINSETTIAS.—The latest batch of these plants should be given their final shift.—Use good loam and leaf soil, with a little sharp river-sand added, and well mix.—The earliest plants will soon be showing flower, and may then be stimulated by affording them weak liquid-manure prepared from sheep's droppings. They should be kept in a temperature of 70° at night, with a rise to 80° during the day. Keep the house close and the atmosphere moist for some time yet.

GENERAL WORK.—Greenhouse flowering plants that have been planted out during the summer, such as Salvias, and which it is intended to bring in for flowering during the winter, may be growing too grossly. If this be so, a check should be given them by cutting

through the roots 4 inches from the stem. This will also tend to the ripening of the wood. Although very old plants, S. splendens and S. coccinea are very showy and desirable; during the winter the flowers are very realizable. For exting purposes.

are very valuable for cutting purposes.

Euphorbia Jacquinælora, whether planted ont in the stove or grown in pots, may be given a good sprinkliog of Clay's Fertiliser, it will result in a vigorous growth being made. This plant well repays any extra attention given at this stage of its growth, for on the strength of the growth now made depends the length of the sprays of flower. It is possible to obtain sprays 8 or 9 inches long. In most of the structures where fire-heat has been temporarily dispensed with, such as ferneries, it will soon be necessary again to use a little, in order to displace the excess of moisture that accumulates. A little warmth in the pipes during the day will evaporate much moisture after watering. If the weather is at all favourable, ventilate at the same time that the fire-heat is employed. The heating apparatus ought to be overhauled annually; and boilers and apparatus can now be cleaned and put in repair with but little inconvenience. The stove-plants will now require increased attention. If the weather be dull and sunless, allow the fires to be kept going, and afford abundance of ventilation. In this way the wood in stove-flowering plants will become thoroughly ripened before the autumn has passed, and therefore the less likely to be injured during the dull months of winter. Although shading may not be altogether dispensed with at present, the blinds must only be used on the very brighest days, and in the course of a fortnight their use may be discontinued for the season.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

GENERAL REMARKS.—Therecent showery weather has saved much labour in watering, and this may now be turned to other account. Remove or shorten back all protruding branches of evergreen trees in the shrubberies without more delay, and if it be intended to plant the shrubbery borders with spring-flowering plants or bulbs, they should at once be given a heavy dressing of manure, and afterwards dug. Contiaue to remove all decaying matter from plants in the flower-beds, and maintain a neat appearance as long as possible.

BEDDING PELARGONIUMS, ETC. — Cuttings of these put in last month will have commenced to make growth, and the plants should be gradually inured to full exposure, in order that the growth may be strong and stocky, which will prevent many losses during winter. Where bedding Lobelias are propagated by cuttings in preference to seeds, and there are no stock plants, a number of the plants in the borders may be cut down at once. These will soon produce a quantity of young shoots, which may be struck in light sandy soil in heat. Another method which answers equally well is to pot-up a few old plants, from which euttings may be taken during the spring months.

HERBACEOUS BORDERS are now in many gardens at their best, and there is promise of a good display of bloom for some weeks to come. Harpaliums, Rudbeckias, Chrysanthenum maximum, Everlasting Peas, Gaillardias, and a host of other species are in bloom. Lobelia cardinalis and the variety Queen Victoria are grand plants. They are not only useful perennial bedders, but they furnish excellent flowers for cutting. This species is thought by some to be but half hardy, and they are lifted in the autumn, and wintered in cold pits or frames; but should they be considered unsafe out-ofdoors, the risk, if any, may be avoided if the crowns be covered with ashes, or some such protecting material. The full beauty of the plant is not developed when they are disturbed yearly. Oldestablished clumps always produce an abundant bloom, and are most effective when growing in masses. If the stock be a limited one, it may be increased by lifting the roots during October, and dividing the crowns. These may afterwards be planted in boxes at regular distances apart, or potted up singly into 3-inch or 5-inch pots, according to the size of the crown. During the first winter they may be allowed to remain in cold frames, or plunged in ashes or fibre out-ofdoors where protection can be given 'as needed. Propagation may also be effected by seeds, which the plant usually produces freely.

SALVIA PATENS.—Massed beds of these afford such a wealth of colour that it is indispensable where a good blue-coloured flower is needed. In most localities it is necessary to lift the roots in the autumn and store them in sand, or some other light material, in the same way that Dahlias are treated.

CEANOTHUS GLOIRE DE VERSAILLES is just in flower, and is one of the most beautiful of flowering shrubs. Although not quite hardy in some localities, it should be planted where there is any possible chance of it succeeding, even if it should need protection during the coldest winter months. The rich blue spikes of bloom are exceedingly attractive. If the plant is placed against a wall, protection is more easily afforded than in the shrubberies. Although this plant delights in plenty of moisture, yet undrained soil is most undesirable, and is more often than not the cause of failure.

THE ORCHID HOUSES.

By W. H. WHITE, Orchid Grower, Burford, Dorking.

MASDEVALLIAS .- In most collections there are some plants that require to be re-potted through the compost having become sour and soddened. Strong healthy specimens may need additional rooting space, and large over-grown masses which have become bare of foliage in the centre should be turned out of their pots, carefully divided, and potted up afresh. A few days previous to disturbing the roots, allow the plants to become moderately dry, the roots will then be less liable to become injured. If Masdevallias be grown in a suitable temperature, they make a great number of long vigorous roots, and require pots of considerable size.

The pots should be two-thirds filled with drainage, and the crocks fixed in the pots in an upright position, taking care to make them as hollow as possible. Over these place a layer of sphagnum-moss. In re-potting keep the base of the plants on a level with the rim of the pot, and carefully work in among the roots a compost consisting of equal parts of peat and sphagnummoss, occasionally inserting a few thick pieces of crock. Make the compost moderately firm, but not sufficiently so to prevent water from passing through rapidly.

Many of the plants that were re-potted last season and are now in a satisfactory condition, will not need to be re-potted, but if the surface of the soil is covered with seedling Ferns or with conferva, it should be carefully picked out until the crocks are seen, and fresh peat and moss substituted. For the first few weeks after re-potting, water very sparingly, as an excess of moisture at that time will result in the loss of many leaves and roots; but as each plant becomes re-established, the quantity should be gradually increased. To avoid black and spotted leaves, prevent the plant becoming permanently saturated, especially through the autumn and winter, when every care should be taken that no plant is watered unless the soil is really dry; and then if the plant is not properly rooted, the compost should not be thoroughly scaked. An excess of atmospheric moisture during dull weather is also a cause of "spot." During the next six months afford water with discretion, and when the external temperature is falling, gradually reduce the amount of atmospheric moisture inside. When it becomes necessary to use fire-heat, care must be taken to prevent aridity in the atmosphere. It is very difficult to give precise instructions in this matter, as much depends upon the situation and construction of the house, and upon it being a naturally dry or moist one.

It is equally important to keep the plants free from insects; yellow thrips may attack the young leaves to such extent that healthy growth is impossible. As soon as insects are observed, use the XL All vaporiser, which will quickly eradicate and destroy them, but will not injure the tenderest leaf-growth. It is always advisable after using this preparation to closely shade the plants from the sun's rays for a day or two. To enumerate all the species and varieties of Masdevallia would be unnecessary here, but a few of the leading ones may be mentioned. Many of the species, as M. Veitchiana, M. amabilis, M. Barkeana, M. coccinea, and its numerous varieties of the Harryana type, are characterised by flowers of brilliant colouring. The best forms of the orange-scarlet M. ignea are well worth growing, as the flowers are very useful during the dull season, and remain a long time in perfection. The yellow-coloured M. Pavisii is quite distinct and useful for hybridising purposes, so also is the white M. tovarensis, a species which should be in every Orchid collection, it being especially valuable for making button-hole bouquets. Among the plants most interesting to the botanist the following should be added: M. maerura, M. elephanticeps, M. Gargantua, M.

peristeria, M. ephippium, M. coriacea M. melanoxantha, M. Schlimi, M. Trochilus, M. infracta, M. maculata, M. Reichenbochiana, M. cucullata, and the semsitive M. muscosa. A well-bloomed plant of M. polysticta forms a pretty object, each spike producing many small spider-like flowers. The Gnat Orchid, M. culex, now known under the name of Pleurothallis macroblepharis, is always a great attraction when in flower. M. racemosa Crossi is a pretty and distinct species; it grows with great freedom, but there is some difficulty in getting it to flower satisfactorily. The undermentioned dwarf-growing varieties are all pretty and free-flowering, and would make an interesting collection: M. Wagneriana, M. Armini. M. rosea, M. Estradæ, M. triaristella, M. ionocharis, M. triadactylites, M. caudata Shuttleworthi, M. hieroglyphica, M. floribunda, M. melanopus, M. picturata, M. Wendlandiana. These being of dwarf habit may, if the house is a naturally damp one, be suspended in small shallow pans close to the roof-glass, but should the atmosphere be dry, a light position upon the stage would be better. Masdevallia hybrids are extremely pretty and interesting, and M. Courtauldiana, M. Fraserii, M. Geleniana, M. Stella, M. Cairiana, M. Estradæ-caudata, M. Chelsonii, M. Shuttryana, M. Hincksiana, M. splendida, M. glaphyrantha, M. Henriettæ. &c., should be added to a collection where possible.

HEATING APPARATUS.—Thoroughly overhaul and put everything connected with the heating apparatus in working order, that if severe weather should occur during the winter, the maintenance of the proper temperatures may be obtained without difficulty. When cleaning out the boilers, hot-water pipes, &c., it is advisable to make the best use of all the sun-heat obtainable to keep up the temperatures, and to use the ventilators but moderately. At the same time use less water when damping-down, and keep the plants rather on the dry side than on the wet; thus, if any plant appears to be suffering from dryness at the root, about half the usual quantity should be afforded. These remarks are, of course, only applicable to the warmest divisions; the work need not affect those species in the cool houses in the least degree if done at once.

THE KITCHEN GARDEN.

By C. Henrin, Gardener, Dropmore, Maidenhead.

WINTER SPINACH.—The carliest Spinach plants should now be large enough to be thinned, and this may be done in two operations. Leave each plant 3 or 4 inches of space for the present, and if they are free from disease and wireworm, every other plant may be removed later. The leaves can be used then, but if they are not required, chop out the plants with the hoe. As more land has now become vacant, another sowing should be made of the Improved Victoria round seeded variety. This will be useful should the early sown plants become too large, for although strong plants are necessary to withstand a severe winter, extra size and soft growth is not desirable. The ground being at present moist and warm, germination will soon take place. The drills for this late sowing should be made 15 inches apart, and the ground be well trodden over previously. Before sowing the seeds, scatter over the ground and in the drills a mixture of soot and wood-ashes in equal proportions.

CAULIFLOWERS.—A second sowing of dwarf Erfort Manmoth and Early London Cauliflowers may be made forthwith. In a season like the present it is probable that the plants from this sowing may be more satisfactory than from seeds sown earlier. the plants become too large, buttoning may be a source of trouble later on. If a portion of the plants be wintered from each sowing, choose eventually the greater number from those plants which are a suitable size. This will be evident enough by the time the plants are ready for being pricked out into handlights or frames. Sow upon a fully-exposed border, and facing south or west, and after levelling the surface, scatter the seeds thinly in shallow drills drawn 9 inches asunder. In the event of showery weather, a sharp look-out must be kept for slugs, and a dusting of lime and soot applied if these are troublesome. Cover the seeds with garden-netting to protect them from birds.

SALADING.—Lettuce and Endive raised from sowings made a month since should be transplanted in quantity, to furnish heads for placing in frames, &c., for an early-winter supply. An open and sunny situation will be most suitable. A small sowing of Brown Cos Lettuce may be made thinly in an open position, to stand through the winter. Mustard and

Cress should now be sown under hand-lights or in frames; it being liable to damp off if exposed to heavy rains. Radishes should still be sown for succession; the French Breakfast is a quick-growing variety, and this or a similar one should be chosen for sowing at this season.

GENERAL WORK.—Since the recent showers. weeds have sprung up very rapidly, and when the weather is dry regular use of the hoe should be made. The Chinese Artichoke (Stachys tuberifera) which made little progress during the dry weather, has now made a start, and the ground between the rows should be heed ever to prevent weeds and to encourage active growth, or the tubers may be small. Vegetable Marrows that were planted early have produced their first crop of fruits, and should be given some assistance by liquid-manure, in order to keep them in bearing. Vacant ground may be filled with any kind Vacant ground may be filled with any kind of Colewort, late Savoys, or other green crop. Any late-sown plants of the Drumhead Savoy put out now should furnish small heads that will stand severe frosts, and turn in during the early months of next

THE HARDY FRUIT GARDEN.

B / G. WOODGATE, Gurdener, Rolleston Hell, Burton-on-Trent.

FIGS.—The Fig trees in this garden are still producing numerous truits, which are both large in size and of good quality. Any fruits which may form on this season's wood should not be retained with the idea that they will stand the winter and ripen early, but they should be rubbed off forthwith. To do this will tend to the formation of fruit-buds, that will remain in a latent condition till next spring. Do not lay in any more shoots of the current season's growth than there is ample space for, or the wood that is left for producing next year's crop of Figs may, through lack of sun and sir, be badly matured.

VINES.—Any that are trained on garden walls, &c., should have every lateral shoot pinched back to one good leaf, which will allow the son to reach both young wood and fruit, and aid in maturing them. A few of the leaves may also be removed, if much crowded.

RASPBERRIES.—The canes which have fruited should now be removed, and a sufficient number of the strongest new ones tied in to take their places. If new plantations are to be made of the varieties in stock, any good surplus canes may be left untouched till the planting season, to be then transplanted to the new beds being careful when digging up the roots not to disturb the roots which remain more than can be avoided. When not required for making plantations, or filling up vacancies, all superfluous canes should be removed with the knife.

ROOT-PRUNING. - Now is a good time to make a note of such trees that require root-pruning, or lifting and transplanting at the proper season.

FRUIT-GATHERING. — Many early varieties of Apples and Pears require almost daily attention at this season, taking the fruits as they become fit for use as dessert and cooking, or for storing, as the case may be. All fruit should be plucked when dry, and it is prudent to use only small flat baskets, so that the fruit be not much piled up, and it is advisable to place some soft material below the lowest tier to prevent bruising. In order to ascertain if a fruit is in a fit condition for being gathered, lift it gently until it comes to the horizontal position, when, it the stalk parts readily from the branch, it is fit. Peach and Nectarine trees with ripening fruits, should be examined once or twice a day, carefully taking those which are almost ripe. These will finish off and be of good flavour if placed in a cool fruiteroom, being at the same time less hable to injury from wasps and flies.

STRANGE HABITATION FOR BEES.—In a dwelling on the farm of Jameston, on the estate of Ardoe, some 5 miles from Aberdeen, occupied by Mr. Walker, some bees have made a nest in a liquid-manure barrel standing in the farmyard, and laid up their winter stores of honey. It is not uncommon for bees to seek a lodging in the trunk of a decayed tree, the thatched roof of a house, or even a church; but it is unusual for the scouts—bees always send out foreranners to select a place of settlement—to choose a barrel with a narrow means of ingress and caress as a place for the community to settle in. There are no hives about the farm, and it is probable that the bees came from a long distance.

APPOINTMENTS FOR THE ENSUING WEEK.

SUPPLAY, SLPT. 6 Royal Agricultural and Horticultural Society of Ghent Sh.

7 0.SDAY, SEPT. 8 Royal Horticultural Society's Committies.

WOONESDAY, Ster. 9 Royal Caledonian Horticultural Society in Waverley Market, Elinburgh (two days).

Paisley Horticultural Society Sh. Thame Horticultural Society Sh. Exhibition of Produce from Small Holdings, at Botmic Gardens, Manchester.

SALES.

F. ERY DAY, Dutch Bulbs at Protherog & Morris' Rooms.

SEPT. 7 DAY, Sept. 7 Dutch Bulbs at J. C. Stevens' Great Rooms.

YEESDAY, SEUR. S. Clearance Sale of Stove and Greenhouse Plants, Hay, Carriage, and other effects, by order of Mrs. Jewell, at Hall Place, textey, by Profileroe & Morris. Dutch Bulbs at J. C. Stevens' Great Rooms.

Fifteenth Great Annual Trade Sale of Winter-blooming Heaths at the Longlands Nursery, Sideup, by order of Messes, Gregory & Evans, by Protheroe & Morris Dutch Bulbs at J. C. Stevens' Great Rooms.

7939 SDAY, Sect 10 (Important Trade Side of Heaths, Terns, Carnations, and Roses at the Mill Lane Nursery, Cheshont, Herts, by order of Mr. E. Rog-ford, by Protheros & Morris, Dutch Bulls at J. C. Stevens' Great Rooms.

L-TDAY, Soft II

Second Amond Trade Sale of Greenhouse and other Plants at the Avenue Nursery, Rexley Heath, by order of Messas P. H. & J. Cooper by Protheroe & Morris', Orchida at Protheroe & Morris' Reseas.

CHRECTED AVERAGE TEMPERATURE FOR THE EN SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -58?

M. GUILLON, demonstrator at L. Lea Grapes, the National School of Agriculture at Montpellier, has lately published a treatise on the Grapes grown in the East (Les Cepages Orientaux; Paris: Georges Cakiré, 3, Rue Racine). The book is of interest to our Grape-growers, as it deals with several varieties well known to them, such as the Muscat of Alexandria, Gros Colmar, here colled Dodrelabi, and others. The descriptions have been taken from living specimens in the National School of Agriculture of Montpellier. After a short historical introduction, M. Goddlon goes on to speak of imperfect fertilisation (couldnee), which he combats by girdling, pinching, and specially by artificial fertilisation

The description of each variety includes an amalysis of the must, or unfermented juice, showing the specific gravity, the quantity of signs and of acid per litre, the average weight of bunch, the number of seeds, the date when spring growth begins, the periods of flowering, of maturity, and of defoliction, &c.

F. may be of interest to cite the analysis of two of our best known Grapes, which are isdeed far more extensively grown here than in France—Museat of Alexandria (1.), and Codrelabi, or, as we call it, Gros Colmar (11.):

			1	11
Posity (Beaume	d 15)	٠.	8:1	7.1
🏲 wax, per litre			 105 gr,	111 gr
Ash'y, per litte			 1182	9.47

Gros Colmar is no better in France than it is howe, though its fine colour and appearance reader it a favourite in the markets. This Graps

is said to be subject to "Shan Knig." under which curious appellation (for which the French printers are responsible) is designated what we usually call shanking. We have not observed that this Grape is particularly subject to this malady here. We append M. Guillon's conclusions:—

Grapes with white and clongated berries (large or small) are the best from many different points of view. They are ornamental, of a very pleasant taste, naving firm flesh with a thick skin, which makes them travel better than others.

Those in which the berries are spherical (large or smill) have generally an exquisite flavour, juicy flesh, a delicate skin, and many among them are near to the Muscat section.

Grapes with rosy and clongated berries have a very fine appearance, but the flavour is indifferent, rendering them more particularly suited for cooking. They constitute, by the form and colour of their fruit, as well as by their characteristics of hearing, foliage and branching, the most homogeneous class. This homogeneity serves to explain the eastern origin of Vines, such as Cornichon and some others presenting the same appearances, but whose origin is scarcely known.

Grapes with rosy and long berries come near the Olivette section.

Grapes with black berries are the least interesting. Their fruit much resembles in colour and appearance that of the indigenous Vines, and as they have not been cultivated, a great number are but little productive. Further, their flavour is often too acid.

Judging by these illustrations, it would seem that white Grapes have a greater adaptive faculty than red ones, because from the latter, as is well known in the East, only products of inediocre quality are obtainable. This fact may be explained on the ground that red Grapes are generally less sweet and richer in acidity than the white. As variation in the propertion of the acidity has considerable influence on the flavour of the fruit, it follows that the least alteration in the proportion, induced by climate or whatever cause, alters the taste of the Grape in one way or another; that is to say, it becomes too insipid or too acid

ABIES NOBILIS (see p. 275, fig. 52) well deserves ts name. It is one of Douglas's introductions, and occurs in forests in Oregon, and on the Cascade Mountains, where it grows at an elevation of 3000 to \$000 feet, and attains a height of 200 to 300 feet. Donalds sent seeds of it home so long ago as 1831 to the Royal Horticultural Society, so that there are now many speci mens of good age and size scattered through the country. Some of the forms are much more glaucous than others, some have a more robust habit than others, and hence have arisen sundry varietal names, but there is, in general, little difficulty in recognising the species. It comes freely in a relatively young state, and the cones are particularly handsome, and have often been figured. In the votes taken at the Conifer Conference the highest number was awarded to this Silver Fir, as most suitable for planting in parks. The largest specimen noted in the Conference Report (1891) was one at Birr Castle. King's County. Ireland, which was recorded as having attained a height of 83 feet. As a timber-tree it is of secondary importance. Our figure was taken from a photograph kindly sent to us by Mr. WILLIAM MILIER, Combe-Abbey, Coventry.

LILIUM PHILIPPINENSE.—This species, from the temperate regions of the mountainous districts of the Philippine Islands, at an altitude of 10,000 to 12,000 feet, is one of the most beautiful of Lilies, and might be described as a white Lilium Prowni. It has been found to be hardier than Lilium longiflorum. The plant grows to a height of 2 to 3 feet, and the stem is slender and wiry, with linear leaves about 9 inches in length. The flowers are about 9 inches in length, trumpet-shaped, white, and very fragrant and they appear between August and October. It is

well adapted for out-loor and pot-culture. Some fine-grown blossoms of this beautiful Lily reach us from Mr. Ware, Hale Farm Nurseries, Tottenham, which quite bear out the above description kindly sent with them, excepting in so far as regards the olonr, which would be more correctly described as French white, with a faint purplish tint on the keels, of the perianth segments, visible only on the outside of the same.

NATIONAL CHRYSANTHEMUM SOCIETY. -- At t meeting of the general committee, held on the 44th ult., the secretary, Mr R. DEAN, reported that the fluances were in a satisfactory condition, and that the Jubilee Fund was growing, though, so far, it had fallen short of the sum actually required, and that further donations were desired. Mr. W. Mease was appointed as judge at the October show, in the place of Mr. GEO. BECKETT, who had resigned; and Mr. D. INGAMELLS a member of the general committee, in the place of Mr. C. HICKS, who retires. Forty-two candidates for membership were elected, and five societies admitted to affiliation, including the Hamburgh Chrysanthemum Society, the first society of the kind established in Germany This makes the twenty-second society affiliated during the present vear

THE HAMMERSMITH HORTICULTURAL SOCIETY.—On Friday, August 28, a number of the members of this suburban society, headed by the hairman, Mr. James Hillier, paid a visit to Messrs. H. Cannell & Sons' nurseries at Swanley and Eynsford, inspecting the varied contents of the glassfordses, and the crops of flowering plants, vegetables, fruit trees, &c., growing in the pen air, it both their establishments.

ROYAL HORTICULTURAL SOCIETY OF ABERDEEN. The recent show of this Society was financially a failure, the takings amounting to £51 less than the expenditure. This was a great disappointment to Mr. J. Murray, Glenburnie Park, Aberdeen, the Chairman, and he, to obviate the necessity of encroaching upon the small balance lying at the bank to the Society's credit, set himself the task of making up the deficiency. Heading the list himself with £10, Murray proceeded to canvass a few friends of the Society, and in the course of a couple of hours he had succeeded in obtaining the desired sum, £51 fs. 8d

ORCHIDS OF SOUTH AFRICA.—We are glad to innounce the publication of the second part of Mr. Robus Fromes Orchiderrum Austro-Africanarum, by Messes Wesley & Son, 28, Essex Street, Strand, London, W.C. The first part has proved of such standard excellence that Orchidologists will gladly and this further instalment, to which we shall allude more fully on a subsequent occasion.

MELBOURNE BOTANIC GARDEN.—The Australasion of July 11 contains an illustrated article on the Melbourne Botanic Garden, the jubilee of which occurs this year. Mr. JOHN ARTHUR was the first Curactor; he was succeeded by Mr. Dallocay, and in 1857 the Government botanist was appointed to superintend the garden, and was indefatigable in making known and distributing its riches. In 1873 Mr. Guilfoyle was appointed, under whose management several improvements have been carried out.

POTATO GROWERS' STRIKE IN BRITTANY.—The Eristol Times and Mirror reports at Pont l'Abbé, 11 miles from Quimper, différences have arisen between the local Potato growers and the English buyers, which have led to an almost complete stoppage of the local Potato export trude. The growers have absolutely refuse 1 to sell their crops to the English igents, who have come, as usual to Pont l'Abbé, with cessels for the conveyance of their purchases to England, at less than 3 francs per 50 kilograms. The agents offer 2 francs 50 cents. Several acts of violence are reported. One English agent, who had refused to accept a cargo at the price demanded, was being over the water until he agreed to the peasant's terms.

Fig. 52 —Abies nobilis, growing in the gardens of the arl of graven compleabety collisity. (Set P 274.)

"THE MUSHROOM, How TO GROW IT FOR PROFIT."—This is the title of the smallest manual on the culture of Mushrooms with which we are acquainted, containing as it does but seven and a half pages of printed matter. In these few pages Mr. John Cobban, of the Market Place, Rotherham, has contrived to give the essential points of his subject, and, as we think, with a fair amount of success. The cottager, allotment holder, and farmer will find useful information on the cultivation of the Mushroom out-of-doors, in cellars, under a greenhouse stage, and in pastures.

FAVOURITE FLOWERS OF GARDEN AND GREENHOUSE.-Yet another serial work on garden matters added to our already over-redundant stores, differing, however, from most of the preceding ones by reason of its coloured plates. The subject-matter follows the classification of the Genera Plantarum, the first number commencing with Clematis (Ranunculacere), proceeding to Thalictrum, Anemone, Hepatica, and Caltha. Mr. EDWARD SELP, F.L.S., has provided the text, including the lists of varieties, and also the cultural directions; the latter have, however, been revised by Mr. W. Watson, assistant curator of the Royal Gardens, Kew. For those who want to know something more about the plants cultivated in their gardens than how to grow them, the present work should be of especial value. It is carefully edited, and well printed on thick paper, and the illustrations are, so far as we have seen them. true to nature. The publishers are FREDERICK WARNE & Co., 15, Bedford Street, Strand, London, W.C., who issue it weekly at the price of 1s. net.

FRUGIVOROUS BATS.—Mr. Hant reports that bats cause considerable damage to fruit-trees by taking away the seeds of Coffee, Tea, and other plants, and invariably choosing the best and ripest. Under their feeding-place, which is generally the underside of some branch of a tree, there is frequently found a small heap of fruits, and advantage is taken of this peculiarity to secure seeds of tall trees from which seeds are not easily obtained otherwise. Early in the morning, before the heaps are dispersed by other animals, rare seeds and fruits may often be obtained in this way. "Bullitin, Botanical Gardens, Trinidad."

MIDHURST HORTICULTURAL SOCIETY.—The annual show of this society was held in Cowdray Park on Wednesday, Aug. 26, the entrics exceeding by more than one hundred those of last year. The exhibits were of such excellence that the judges had no easy task in awarding the prizes. There were numerous contributions not for competition, including some lovely Cactus Dahlias from Messrs. Jackman & Son Woking, and Miss McHonald, Chichester, who also showed, for the first time, a seedling Tomato very like Challenger in shape, but pure bright yellow in colour.

AMERICAN BLIGHT.—According to a statement made in the Journal of the National Horticultural Swiety of France, hydrochloric or mariatic acid, commonly called spirit of salt, may be used with advantage for the destruction of the American blight. It kills the insects, and promotes the healing of the wounds. It is recommended that a mixture of clay and coxpluing be mixed with the acid till a mixture is made sufficiently thick to be laid on the wounds with a paint-brush. In trying the acid, experimenters must not forget the very poisonous and corrosive nature of the acid, and act with becoming caution.

DUTCH HORTICULTURAL AND BOTANICAL SOCIETY. FLORAL COMMITTEE.—On the occasion of the meeting of this society on August 8, 1896, the committee awarded First-class Certificates to Mr. A. Buis, jun., of Adsmeer, for Phlox decussata fol. aur. var.; to Mr. C. G. van Dijk, of Zeist, for Rudbeckia lacunata fl. pl. var. Gold Ball, Cactus Dahlias Mrs. Baines, and W. B. Wright; to Mr. K. Keessen, jun., of Adsmeer, for Cormus Spathi var.; to Messrs. E. H. Kielage & Son, of Haarlen, for Gladiolus Lemoinei vars.; Yvette Guilbert, G. L. Emile Auger, G. L. Jane Diculatoy, G. L. Professor Le Monnier, G. nanceianus Pacha, G. n. Canrobert, G. n. Général

Duchesne, and G. n. Jules Finger; to Mr. C. G. van Tubergen, jun., of Haarlem, for Canna Austria and Canna Italia; and to Mr. N. de Zwaan, of Utrecht, for Begonia grandiflora erecta cristata. Certificates of Merit were granted to Mr. Egb. Kloosterhuis, of Veendam, for Acer pseudo-platanus argyreus and Robinia neo-mexicana; to Messrs, E. H. Krelage & Son, of Haarlem, for Gladiolus Lemoinei vars.; J. J. Weiss, G. L. Madame Desbordes Valmore, G. L. Deuil de Carnot, and G. nanceianus Julien Girardin. Votes of Thanks were given to Mr. J. W. Daudey of Haarlem, for Gloxinia narcissiflora; to Mr. C. G. van Drijk, of Zeist, for Astilbe rivularis, Eryngium Olivierianum superbam, Gladiolus Lemoinei in three varieties, and Rudbeckia purpurea.

BULBS IN THE PARKS OF THE LONDON COUNTY COUNCIL.—We are requested by Messrs. W. CUTBUSH & SON, of the Highgate Nurseries, to notify that the supply of the whole of the bulbs required by the London County Council for the parks under its charge are to be supplied by them this season.

TOMATOS .- Mr. W. H. MUNSON contributes to the Massachusetts Horticultural Society a paper on this vegetable, of which the following is a summary: -1. Lycopersicum esculentum, from which most of our common varieties of Tomatos have been developed, is a native of Peru, but is spontaneous or indigenous as far north as Texas and California, in a form closely approaching the "Cherry" Tomato of the gardens. 2. The Tomato was first cultivated in the south of Europe, and is mentioned as early as 1561. 3. The fruit was used for food in 1583, but was slow in coming into general use. Seven varieties were known at the beginning of the eighteenth century, but not till a hundred years later did the culture become general in England. 4. The Tomato was known and used as an article of food in this country in 1806, but was not grown for market until about 1829. 5. The modern large-fruited and irregular-shaped varieties, including the French apright and the grandifolium or Mikado type, have undoubtedly been developed from the "Cherry" Tomato or a closely-related form; and this development has apparently come about largely by the augmentation of the cells in the primitive type. 6. The results obtained from crossing the common Tomate with Lycopersicum pimpinellifolium indicate a promising field for the development of new types. 7. Solidity of fruit is an individual rather than a varietal character, and this character is often dependent on the amount of pollen received by the flower. 8. If properly handled in a glass house, Tomatos may be set in the field much earlier than is commonly supposed, with good results. 9. Trimming plants in midsummer has usually resulted in slightly hastening the maturity of fruit already set. 10. While heavy manuring does not lessen productiveness, the best fertilisers are those which act quickly and hasten growth early in the season. 11. For New England, the most profitable work with Tomatos may be carried on under glass. For this purpose Lorillard, Chemin, Optimus, and Golden Queen are the most

MR. HORACE BROOKS MARSHALL, the pioneer of the railway bookstall trade, and head of the well-known firm of publishers and newspaper agents, Messrs. HORACE MARSHALL & SON, died on the 1st inst., in his sixty-seventh year.

THE BRITISH ASSOCIATION.—It is twenty-six years (vide Times of August 28) since the British Association met at Liverpool. The 1870 meeting was a remarkable one. The President was the late Professor HUNLEY. His masterly address on Biogenesis created a great stir. There is no lack of interesting subjects to engage the attention of the Liverpool meeting, and no dearth of competent men to deal with them. Dr. D. H. Scott, F.R.S., as president of the youngest section, K, Botany, proposes in his address to speak of the present position of morphological botany, shortly reviewing the results of modern research, both on recent and fossil plants, in so far as they throw light on the question of the origin and relationships of the chief divisions of

the vegetable kingdom. The following fixtures have so far been made for Section K. A discussion on the Structure of the Cell-nucleus will be opened by Professor Farmer, of the Royal College of Science. A discussion on the Ascent of Sap will be opened by Mr. Flancis Darwin, of Cambridge. Mr. Thiselton Dyer will give an afternoon lecture on the Geographical Distribution of Plants.

PUBLICATIONS RECEIVED.—Manual of Practical Orchard Work at the Cape, by P. MacOwan and Eustage Pillans (Cape Town: Richards).—Agricultural Gazette of New South Wales, July, contains a valuable article on ornamental and shade trees for the climate of Sydney.—Transactions of the Massachusetts Horticultural Society for 1895, part ii.—Xenia Orchidacea, vol. iii., part ix., by Dr. F. Kränzlin, Leipzig, Brockhaus; will be noticed in a subsequent issue.—Conspectus Sectionum Specierumque generis Paulliniae, L. Radikofer; Munich, F. Straub.—Report of the Botanical and Afforestation Department, Hong Kong, by Charles Ford.

SENECIO COMPACTUS.*

This handsome species, for a specimen of which we are indebted to Mr. Gumbleton, is remarkable for its dwarf, compact habit; although rarely exceeding 2 feet in height, it attains a diameter of from 3 to 6 feet; and as nearly all its crowded branchlets are terminated by flowers, it presents a most attractive appearance (fig. 53).

NOTES FROM THE ROYAL BOTANIC GARDENS, EDINBURGH.

THE following plants are now in flower in these gardens:—

Disa grandistora.—These plants are this year flowering very freely, four plants in good-sized deep pans, carrying one hundred and twenty expanded flowers. One plant has been three years in the same compost, and has only now commenced to show signs of a renewal being required. Two years would appear long enough for them to remain without a shift. We use a compost of the best root fibre, containing a little loose loam and peat in equal proportion; with a good addition of clean crocks, sandstone, and chopped sphagnum-moss. Potting is done as soon as new growth commences.

timelina hystrix. — This, recently introduced, flowered at Kew in 1894, whence it was sent by Mr. Goldring from the gardens at Baroda. It has a scandent habit, with bright-evergreen foliage, and produces drooping terminal cymes of large, tubular, yellow flowers, which spring from brownish-green bracts. A small plant received from Messrs. F. Sander & Co. in the spring is now in flower hero. It seems to delight in exposure to the sun's rays, and should make a good plant for clothing a pillar in the stove.

Bigmonia purpurca.—This species is one of the most showy of the genus. It likes a good long run in which to develop its long branches, and plenty of light to ripen the wood. The flowers are freely produced in large panicles. The mauve colour in the flowers is a charming contrast to the green foliage; and if shoots are allowed to hang about a yard or more from the roof, the best effect possible is gained. A native of South America, it was introduced in 1822, and was figured in the Botanical Magazine, t. 5800.

Purnussia palustris .- A bed of this is in full

Seneco compactus, T. Kirk, Trans. New Zodand Institute, 1879, vol. xii, p. 395.— A much-brunched compact shrub, rarely more than 2 feet high. Branches stout, erect, and with the under surface of the leaves, pedicels, and involueres densely covered with appressed tomentum, forming a smooth surface. Leaves petioled, ascending 4 to 1 inch long, ovate or obovate obtuse, minutely waved at the margin, cremulate. Plowers in leafy four to eight-dowered racemes, terminal and solitary, or axillary and crowded near the ends of the branches; less frequently the heads are solitary and terminal. Heads broadly ovate in bud, 4 to 1 inch in dimeter, broadly campanulate, pedicels 4 inch long, involuend leaves linear, obtuse, cottony; receptacle flat, rays spreading, broad. Achenes furrowed, silly. Pappus white. Hab., North Island, Castle Point, east coast, on limeston rocks, descending to sea-level.

tlower along the margin of the pond in the garden, in which position it thrives well. The white flowers are borne in such quantities as to almost hide the ground from sight, a very large number springing from each clump. For beautifying damp and boggy places during August and September, this pretty British plant should more often be used, for when seen in clumps it produces a very fine effect. Another species in flower is P. nubicola, a Himalayan

Cabbage? Would the judges not walk through this non-liability! If an assistant in a seed-store blunders by sending late for early Cabbage, is the firm not legally responsible for their assistant's blunders? It is all very well for the wholesaler to say in defence, "You saw in my invoice, if the seeds are not accepted on the terms of non-liability they can be returned." The retailer on receipt of the seed can say whether it is in good condition or not, and can very soon test its germinating power, but cannot tell, until it is too late.

it has been planted in one of the flower-beds in the front of the nursery. It has been of some attraction to visitors, being something uncommon, and of very striking appearance. The plants are 12 inches to 18 inches in height, and they are covered with the bright searlet flowers. The plants may be lifted on the approach of frost, and if potted up with eare, the flowering period can be extended into November. It is evidently a suitable summer-bedding plant, especially in a dry and hot season. C. II.

FORMALDEHYDE.—Referring to your paragraph, p. 221, August 22, on "Formaldehyde," your correspondent, 'R. J. L.," will find all the information he requires about this substance in Dr. D. H. Scott's Structural Botany, p. 212, Formic aldehyde (CH₂O). Dr. Scott does not treat it as a marketable article, but as a chemical one, an intermediate or transition state from sugar to starch. Scott's equation is as follows: $CO + H_2 = Cll_2O_g (CH_2O) = C_g ll_{12}O_g$. E. T.

NYMPHÆA STELLATA ZANZIBARENSIS.—In a tank in one of the houses of Win, E. Groves, Esq. (Mr. E. Robert Shaw, gr.), The Larches, Alderley Edge, Cheshire, is a collection of Nymphæas, and the most notable one amongst them is X. S. zanzibarensis. It is a very free-flowering species, and bears cordate ovate leaves of good size. The flowers are captivating from a beautiful shade of Gentian-blue spread all over the oblong ovate florets—the four which form the ealyx being of a mauve tint. The disc, which is crowded with stamens arranged in circles, is yellow, and the stamens have a line of yellow up the inner centre, with sterile-looking anthers of Gentian-blue tint. Mr. Robert Shaw said that the plant continues to flower for six months, and the blooms form a good contrast with those of N. Devoniana and others. Its fragrance is like that of the Stephanotis grandiflora, but it is not so powerful. Pity these flowers only show their beauty during the light of day, closing at night. J. A.

TROPÆOLUM SPECIOSUM.—This is flowering profusely on our rockery, the position being a partially shaded one. The plant was put out in March last, and is now 9 feet high, bushy in proportion, and has several hundreds of its beautiful scallet flowers. When at the Botanic Gurdens, Regent's Park, I frequently tried to grow this plant, but never succeeded in doing so. W. Comber, Lilford Hall Gurdens, Ourolle. [The roots should be started in pots, and when some amount of growth has been made, planted out. Ed.]

DIFFERENCES IN NEPENTHES.—In Kew Notes, p. 230, of your last issue, occurs the statement, "There is nothing remarkable about the flowers of Nepenthes, beyond the fact that, notwithstanding a considerable range of variation in the pitchers, leaves, and habit of the thirty or so species known, there is scarcely any difference in their flowers." Now, so far is this from being the case, that not only is there considerable differences in shape, colour, &c. between the flowers of the different species of the genus, but even in the same species differences occur in the male and female inflorescences. This leads me to ask a question regarding Nepenthes—bicalcarata, a male plant of which flowered in the Edinburgh Botanic Garden some two years ago. Can any readers of the Gardeners' Chronicle say whether the female inflorescence of Nepenthes—bicalcarata is panieled like the male? Perhaps Mr. Burbidge, who first introduced this species into this country from Borneo, could enlighten us on this point. R. Lindsoy.

what is rudbeckia Newmani?—It has generally been supposed that this name, which is variously spelt, is an unauthorised synonym of R. speciosa (Wender): but *Ludva** Kewensis* throws doubt upon this, giving both names as authorised botanical names of authorised botanical species. In that work I have R. Newmani (sh)** London's Hort. Brit.) as a final name in square type: and R. speciosa (Wender) as another, and distinct. Asa Gray, in his *Flora of North America, does not mention R. Newmani at all, and the *Kor Hori Irst does not include it. If there is such a plant, who has it; and where is it to be seen? But it is tiresome to have the name perpetuated as a misnomer for R. speciosa. C. Wolley Dod. Edin Hall, Malput.

TENACITY OF LIFE IN TREES,—If "A. D." (p. 214), had ever been much in woods infested by rabbits, he would long to have ceased to wonder at large trees continuing to live while a strip of bank of over 1 foot in breadth remained on one side. I could show him trees completely banked to the hard-wood

Fig. 53.—Senecio compactus: hardy shrub; flowers yellow. (See P. 276.)

From Mr. W. E. Gumbleton's Guiden, Belgrove, Queenstown,

form of stouter and taller growth, but also bearing white blooms. R. L. H., Royal Botanic Garden, Edinburgh.

HOME CORRESPONDENCE.

SEEDSMEN'S LIABILITY.—The paragraph in your issue of 15th inst. re-opens a vexed question with seedsmen. The wholesale tradesmen shelter themselves behind their non-liability clause, If a wholesale seedsman accepts an order for, say, early Cabbage, sends it out labelled as such, and takes payment for it, is he net at common law entitled to send early

whether it is early or late Cabbage. If it turns out wrong, and the retailer suffers, why should the whole-saler escape by his unjust non-liability clause? It is said the retailer may also adopt non-liability. But how is it practical? His seeds are sold in small quantities for eash over the counter, how can be tell each customer that he is not responsible? Non-liability has the possibilities of injustice in it, and if at any time it is used in a tyrannical manner, retail seedsmen should combine in support of any one who is threatened, and see fair play. A Retail Scalsman.

BOUVARDIA TRIPHYLLA.—This old variety of Bouvardia, introduced from Mexico in 1794, is now in great beauty at the Royal Nursery, Slough, where

to a strip of less breadth than that on his Elms that have lived for years, and they continue to live. But the following fact may be interesting to the plant physiologist. On this estate and others in this part of Yorkshire, the Oak trees are peeled standing, not by the forester's desire, but by preference by the timber merchants, who purchase the lots standing, with all risks of removal, subject to estate conditions. They believe that timber so peeled keeps in better condition than when peeled after felling, and it costs much more to peel the trees standing than felled. Very well. Peeling begins as soon as the sap begins to rise, and is continued till the trees come into leaf, when the bark cannot be detached. Much depends on the weather. A few cold days occurring will arrest the flow of sap, and stop the work; and the trees are never all ready at one time; while, sometimes, a tree will peel on the south side, but not on the opposite side. The peeling begins before the trees come into leaf, and many of the earliest trees are completely stripped of their bank from bottom to top, except the topmost branches, which often form large spreading heads; and the fact 1 wish to draw attention to is, that these large unbarked tops craw attention to is, that these large unbarked tops continue to swell their buds, and come into full leaf, while the peeled trunks, right up to the head, are barkless, and apparently as dry as a board for perhaps from 20 to 40 feet below. On some of the trees the leaves fade before the summer is over; but I have seen many trees carry them till the end of the season. This season, owing to the drought, many trees have turned brown sooner. The second year settles them, however; but I have no doubt that if one or two inches of bark were left on one side, the trees would continue to live. Query-where does the food come from that produces leaves and wood on the tops, after the bark is gone? The moisture from the air might sustain the foliage for a while after it was developed, like a cut branch in a vase; but in this case there is an extension of tissue. Is it the stored-up sap in the sap-wood that does the work? Remember that this outside ring of sap-wood is barkless, exposed to the dry air for months, and to all appearance as dry as a deal, and the sap in it certainly thickened, and not moving much, if at all. J. Simpson, The Woods, Wortley.

CLIMBING SHRUBS.—Crategus pyracanthus Lelandi is one of the prettiest and most useful decorative climbing shrubs for a villa or a mansion. It does well as a shrub, but on a wall it is highly effective at this season. It is not one of the best growers, its diminutive pale green leaves show it to be a comparatively dwarf plant, but at the present time it is clad with bundles almost touching each other of pretty orange-scarlet berries. For contrasting with other things if its neighbours are prevented from over-growing the plant, it is a rival to the Cotoneasters. J. A.

SCARCITY OF WASPS AND ABUNDANCE OF EARWIGS.—Will some reader of the thandeners' Chronicle kindly explain the reason of the almost entire absence of wasps, and the extraordinary abundance of earwigs, this summer. I have been told that when earwigs are plentiful wasps are scarce; and so this summer seems to prove, at least, just around here (Notts & Oxon'). Every crack and crevice is alive with earwigs, and the damage done by them, both in the garden and field, is considerable. I should have thought that such an extraordinary mild winter, and the dry summer, would have been in favour of the wasp. C. Collett.

EXTRACTION OF PERFUME FROM PLANTS.—There is a chemical method lately come into use for extracting essential oils from plants, by the use of carbon disulphide. Can any reader of the Gardeners' Chronicle supply information on the subject, or refer to literature of a recent character? Geneueum.

BELGROVE.

This pleasant residence, situated in the largest of the chain of islands which bisect longitudinally the famous harbour of Queenstown, is synonymous to most horticulturists and lovers of plants with rare plants, the owner, W. E. Gumbleton, Esq., being an enthusiast in their cultivation, with a keen perception of their requirements in the matter of position, soil, aspect, and the other points which go to make plant-growing either out-of-doors or under glass a success.

Belgrove has many and great advantages. It lies high above the sca-level, although it enjoys, of course, a humid climate, and the heat is always tempered by

the sea air: it is naturally well-drained, and that, doubtless, suffices. Trees of indigenous species, as well as most that are exotic, thrive, and arrive at a good size; and the general slope of the grounds and aspect of the best side of the dwelling is southerly; indeed, the land slopes rather abruptly in that direction. There is a flower garden in the widest acceptance of the term; in that contains some of the best of the ordinary bedding plants, besides much more at which many of the rank-and file of gardeners and amateurs look askance, as being little fitted for the purpose of filling the beds. We shall, however, see that the collection of plants in the Belgrove garden has many valuable features and attributes, which render them especially suitable for spring and summer decoration out of doors.

Before we enter the garden proper, let us glance at the very floriferous collection of plants which fill the greenhouse or conservatory attached to the house at the western end. The chief display was afforded by zonal Pelargoniums, numbers of which have been obtained from French nurseries. Of these, we may mention Jules Chrétien, a fine truss of a beautifui scarlet hue, and white eye or central patch : Monsieur Porier, with an effective truss of rosy-purple; Madame Alcide Bruneau, a very pretty flower of a faint blush tint, and a Picotee-like margin, not very double, yet forming a large truss : Madame Buveron, one of the quite new race of spotted Pelargoniums, a pink-coloured flower, with spotting of a deeper shade. There were several of these spotted Pelargoniums of various colours and various degrees of spotting, all of which seem to be most desirable decurative greenhouse plants.

Raised by M. Bruant, of Pelargonium fame, were ome zonals of various shades of rose-pink, namely, Dr. Marmotek, Coralie Bajae, Madame Cadeau, and La Vienne. Some excellent varieties of zonals were remarked in Blue Peter, Mrs. Wright, and King of the Purples, all of which are varieties going a step in the direction of the much wished for blue colour. Colchicum antumnale Bornmulleri, a very early-flowering variety, was growing in a pot in the house, and well worthy of its place, the flowers of a bright lilac colour being comparatively large and striking. Colchicum montanum is a species likewise very early in coming into bloom: the colour is deep hlac or purple, marbled with a dark tint: Disa grandiflora, as we could see, had been grandly in flower, and the plants were taking their rest before being divided and repanned. A remarkably showy plant for the greenhouse at this season is Hydrangea mandschurica, three er four blooms decorating each plant, which were but cuttings last autumn. The colour of the blooms is a shade of pink, and the diameter of a fair-sized head of bloom 5 to 6 inches, and with few of them on a plant, they reach " to 9 inches. Nerine Fothergilli major gave a striking note of colour at one end of this house, the flowers approaching a scarlet hue.

Mr. F. Sander's new plant, Browallia speciosa major, or as it is sometimes called, the Myosotis of the Antilles," is a good flowering subject for pet culture at this season. The flowers open of a deep blue tint, and change with age to a lighter one. A flowering plant of a very desirable colour is Aplopappus ericoides, flowering from the month of July to the end of September. Mr. Gumbleton's plant measured 2 feet in height, with a diameter of 1 foet. He thinks it is likely to prove hardy at Belgrove. It has short Erica-like leaves, and light yellow-coloured flowers, disposed in loose, terminal corymbs. A figure of this plant will appear in these pages shortly. Aplopappus belongs to Compositera, and the species in question is a native of California. We remarked a ine dark-coloured seedling form of Saintpaulia ionanthe (named splendens), raised on the place. It seemed very desirable as a variety Hunnemannia fumariæfolia, a monotypic genus, the species having showy yellow coloured flowers resembling those of Escholtzia californica, was noted. It is an annual plant, best raised from seeds sown in March. A plant of Crinum MacOweni was just about to open its flowers. It is a showy species, and the bulbs in this case were very large, and the flower-

stalk extremely robust. Calceolaria alba is a species seldom met with in private gardens, although it is a pretty enough plant when in bloom. The flowers are white, and rather smaller than those of C. florihunda, globular in shape, and appearing numerously in terminal spikes.

On the wall of the mausion there is growing a plant of Rosa Brunoniana, which flowers enormously in its season, and makes summer shoots of 12 to

15 feet in length.

Situated at the end of the mansion, and separated from the greenhouse above mentioned by a gravelled walk, is a small rectangular flower-garden, in which are to be found growing many of Mr. Gumbleton's floral treasures. The beds are cut out in the turf, and they presented at the time of our visit a very brilliant picture of regulated floriferousness and vigour. The garden has a low wall faced with a narrow border. and here were found Amaryllis Belladonna excelsa, a dark-stemmed very early "Lily," and a white-flowered Gazania, said to be a form of G. pygmæa (bracteata of Brown). This plant has the curious peculiarity of producing plain, and also pinnatifid leaves. Gerbera Jamesoni formed a splendid object in this border, and showed all the vigour of a well-established plant. We think that a bed of this fine South African plant would he too dazzling for most persons. In a small bed, a little distance from the wall, there were growing with great vigour, masses of Crinum Powelli-the type form-showing many very strong spikes of flower; C. P. alba and C. P. intermedia, a large and stronger grower than the type with pink-coloured flowers, and of proportionate size. Alongside of these plants grew Gazania speciosa, a flower of pure yellow, without any orange-colour in the eye, but with very broad rayflorets; Fuchsia Melville's Bedder, of dwarf stature -in fact, a miniature F. Riccartoni-is a pretty subject for a narrow border, a small bed, or a place on the

Among perennial Asters mention should be made of A. turbinellus, a showy lilac-coloured flower. It is still a rare plant in gardens. Aster Thompsoni is also a lilac-coloured species, and one that is earlier in coming into bloom. Rudbeckia Golden Glow is a pure yellow-coloured double-flower, the plant growing to a moderate height. A figure of this variety will

shortly appear in these pages.

Mr. Gumbleton, pointing to a clump of the recentlyintroduced Incarvillea Delavaye, from China, remarked that the plant grew better out of doors than in a pot in the greenhouse. Heliopsis Pitcheriana is a good plant: Haplocarpha Leichtlini is a showy yellowflowered plant, useful in borders; and Lythram elatum is a pretty purple-flowered plant of 2 feet in height, and a neat habit of growth. Amongst Anchusas, a place should be found in every garden for plants of A. Barlieri variegata, if only for its early flowering; and amongst the genus Lychnis (Agrostemma), for some of L. Walkerix, a crossbetween L. coronaria and L. Flos Jovis. Helemum autumnale superbum is one of Lemoine's raising, a showy tall variety, throwing a long succession of flowers on lateral shoots.

Of Lebelias of the cardinalis type, growing together in one small bed, were L. Lugunensis, corallina, and Amaranthis, all good varieties, of various shades of colour. The annual Cosmeas, C. pionata, C. rosea, C. Erlinda, C. E. purpurea, and C. sulphurea, made a nice show. A plant of Physalis Franchetti had grown to the height of 11 foot, and bore a solitary fruit. One of the prettiest beds in this garden was planted chiefly with Delphinium Breehi, a Larkspur of about 12 foot high, and very much branched and floriferous. Another plant of annual duration is Cynoglossum petiolatum, with blossoms of a bright, deep tint of blue. The yellow-flowered Lynaria macedonica made a showy line round a small bed. It grows here to a height of 2 feet. Osteomeles anthillidifolia is a plant with a pretty leaf. A plant of the double-flowered white Camellia Sasanqua grows against the low wall, and may, in course of time, make a good plant. Close by was a plant of Fremontia californica doing well. The early-flowering Colchicum byzantiunm is a species ef a deeper tint than C. Bornmülleri, and very early in coming into bloom, and desirable in beds or pots on that account. Dimorphotheca Echlonias, a South African Composite, possessing large white flowers, which have a purple disc, likes a warm spot even in this mild locality. It reaches a height of 2 feet.

The tuberous-rooted Begonias which are planted in beds by themselves were exceedingly floriferous and vigorous, and some of the best were Lafayette, a brilliant scarlet; Duke of Fife, Viscount Cranbrook, Lady Brooke, Laing's Beauty, Whittaker Heaton, a double-flowered pink variety; the Rev. E. Lascelles' Orion, still one of the best of those which "look up;" Camilla, another of this type; Henshall Russell, Mont Blanc, W. E. Gumbleton, rose-red flowers; Perseus, and H. J. Laing, which are two good "starers." We have never seen anything better than these plants, although, in most Irish gardens, the tuberous Begonia flowers with remarkable freedom. They had been even better than when we saw them. Some beds of Tigridia were noted, but the plants are not doing well.

(To be continued

SOCIETIES.

ELGIN AND MORAYSHIRE HORTICULTURAL.

August 19 .- The show was a most successful one, and the entries were exceptionally large. A large number of professional gardeners were present with most worthy and beautiful exhibits.

J. E. GORDON, Esq., M.P., ON HORTICULTURE.

In opening the annual show of the Elgin and Moravshire Horticultural Association at Elgin on the above date, Mr. Gordon, M.P. for Moray and Naim, made some very interesting remarks on horticulture. After complimenting the society on its vitality and usefulness—it has been in existence ing remarks on horticulture. since 1843—he said he should like to congratulate those members of the society who were gardeners by calling, and who belonged to what he might call the apostolic succession of cultivators of the land. They were men who from generation to generation, had handed down the acquired knowledge and practice of gardening from father to son, and without whose intervention in their own day, they would have suffered great loss in their social system. Books were very good, and precepts and laws were very good, but they required the living hand and the living brain to hand down from generation to generation those things which the different ages of mankind had gathered and learned from nature and passed down to posterity. He also wished to congratulate the amateur gardeners, and for these reasons—that they had turned themselves to a second industry, that they did not allow the deadening effects of routine to put an end to their energy, that they were anxious to raise fresh powers by turning from those long hours of daily routine to a fresh industry and fresh interest—really a recreation when they took to horticulture. Any efforts of their society that could induce inside workers to think of outside interests, to think of the four great chapters of nature-spring, summer, autumn, winter—and that could draw away their thoughts from the more morbid interests and take them out into the fresh air, were calculated to do a great amount of good. Another thing that such a seciety as theirs did was of good. Another thing that such a seciety s, sheirs did was to encourage them to put into the soil something that would outlast themselves. He thought that if there was a race that deserved the contempt of other races in the world it was that race who passed through life without planting the surface of the earth. There were such races, but they were thought of as being at the very earliest stages of human de-velopment. Any one passive through the velopment. Anyone passing through a country where there were fine trees, and signs of gardens and orchards, felt that they were passing through a hand where mankind had distinctly risen to a high level. He thought their society might their tisen to make some amount of effort where they had a little power over the soil to let no year go by without themselves putting in some one fruit tree, some one flower, and some one berry-bearing bush. How often after, when they had removed from the place, would their thoughts go back to it and they would write the some they had removed from the place. to it, and they would write to the owner and ask how the plants were thriving!

Mr. Gordon was enthusiastically cheered by his horticultural friends for his inspiriting address.

BRIGHTON AND SUSSEX HORTI-CULTURAL.

Some Errors in Fruit Culture.

August 20.—The somewhat wide-reaching subject of "Fruit Culture" was put down for consideration at the monthly meeting of the Brighton and Sussex Horticultural Society, held on the above date, at the Imperial Hotel, Queen's Road, Brighton. A paper had been promised by Mr. G. BUNYARD. of Maidstone, but, in view of the large scope of the question, he decided to limit himself to "Ecrors in Fruit Culture " In

ntroducing the lecturer, Mr. J. CHEAL, Vice-chairman, who presided, said that there was no one better qualified to enlighten the society upon the matter than Mr. Bunyard.

Giving his hearers the benefit of the varied experience he had gained in the course of the many years he had passed as a nurseryman, Mr. Bunyard went very carefully into the mistakes that he found were usually committed in the culture of fruit trees, explaining why they were mistakes, Dealing first with the general aspect of the topic, he spoke of mistakes that applied to all fruit trees, such as planting of mistakes that applied to all fruit trees, such as planting them too deeply, or covering them too thickly with manure, and thus depriving the roots of the amount of sun and air they required. In many gardens, and especially in old ones, the soil was made too light—that is, it contained an excessive proportion of vegetable matter. Other errors con-sisted of failing to separate plants that required different treatments, neglecting to supply sufficient moisture to the ground in situations protected from rain; priming too early in the season; improper root-priming; and planting too closely together. Mr. Eunward particularised the treatment that should be given to different kinds of fruit. Incidentally he mentioned that nonsergmen were expected to be ency-elopædias of information, and he gave the impression to his bearers that they would not be wrong in applying that term to himself. From the mass of information he gave as regards the culture of Grapes, Figs, Peaches, Nectarines, Cherries, Apricots, Apples, Pears, Plums, Strawberries, Raspherries, and Curants, he seemed to have made a study of each variety, and to be possessed of much knowledge concerning them. In the concluding portion of the paper, Mr. Bunyard turned his attention to the new varieties of Apples. Pears, and so on, that had been introduced of late, giving his opinion as to their qualities, good or bad. He thought that in recent years great advances had been made in the science and practice of fruit culture.

At the conclusion of the paper a brief discussion took place, the speakers describing the information given as most valuable and interesting. A hearty vote of thanks was accorded to Mr. Bunyard.

DEVON AND EXETER HORTI-CULTURAL.

Continuo (ron p. 251)

AUGUST 21.- TRADE EXHIBITS.

Messrs, Robert Veren & Sox, Exeter, had a splendid display of plants, a strong feature of which was a fine exhibit of Caladiums, Cannas, some of the new Water Lilies, and

some Alpine and herbaceous plants.

The Exertic Number of showed a very fine collection of miscellaneous plants - Cleroden froms, Ferns, Allam oid is, Stephanotis, Crotons, Palms, &c., and some beautifully.

made-up floral designs.

Mr. James Walters, Mount Radford, showed several

boxes of Roses, Dalliss, and herbaccous plants.

The Janeo Figure 1% hal an interesting collection of plants and frints growing in Jelso. The Pyramid Apples in pots cause I much attraction, some of the fruit (Peas2006)'s Nonsuch) being considerably over a pound each.

Messrs, Jarman & Co., of Chivel, had a good assortment of out flowers, noticeable being the Cactus Dahlias, Matchless,

Earl of Pembroke, and Mr. F. f. H. Mr. W. B. SMALL, Torquey, exhibited some very fine Dahlius of the Juarezii type, Mrs. Wilson Noble Mrs. Montefore (deep rich crimson), Mrs. Gordon Sloane (dark cerise), Mrs. F. C. Smale (pure white).

Messrs. Curis, Santonia & Co showed a fine assortment

Mr. Goldrey, Exmouth, had a collection of Begonias, Pelargoniums, Carnations, and grand Cannas, many being

seedlings of his own ruising

Messrs, Indiand & Co., Firms tiple, exhibited Apples, some on branches; and Messrs, Terrain & Sons, Newton Abbot,

SANDY AND DISTRICT HORTICUL-TURAL.

August 27.-This was the twenty-eighth exhibition of a Society which in a remarkable manner caters for the country people. Sandy is in the centre of a market-gardening and agricultural district, and the show, in addition to the horticultural produce in great variety, included tarm and market gardening produce, needlework, honey, butter, eggs, trussed fowls, poultry, pigeons, rabbits, cage-birds, &c , and domestic animals. These necessitated the use of a number of tents, which formed an irregular circle round the grounds of Sandy Place, the residence of Mrs. Foster, in which the show was held. Considering the enormous amount of detail which had to be got through, the arrangements were very

Classes Open to All These include one for ten stove and greenhouse plants in flower. Mr. J. Cvenner took the 1st prize with Bougainvilleas glabra and Sanderiana, Phonooma prolifera Barnesi, Clerodendron Bulfouriana, Ivorus Pilgrimi and Williamsii, &c ; Mv. W. Fixen, Coventry, was 2nd, his leading specimens being Allamanda grandiflera, A Williamsii Erica Turnbulli, and its variety alba.

Some fairly good zonal Pelargoniums were shown, and also pretty plants for table de oration. Mr. Empson, The Gardens, Ampthill House, Ampthill, was 1st, with a very pretty group of plants.

Cat Flowers. - Messrs. G. & W. Burgen, nurserymen, Peterborough, were 1st for Roses, and had capital blooms of Crown Prince, Duchess of Bedford, Mrs. Juc. Laing, A. K. of Crown Prince, Duchess of Bedford, Mrs. June, Laing, A. K. Williams, &c. 2nd, Messrs, Harknits & Sons, norserymen, Beddle, also with some very good blooms for the season. For eighteen Teas, Messrs, Harknits & Sons, were 1st, having Niphetos, Maman Cochet, Marédhal Niel, The Bride, Ernest Metz, &c., in good form; 2nd, Messrs, G. & W. Burn, their leading varieties being Jean Ducher, Etoile de Lyon, and Francois Krutor. and François Kruger.
With twenty-four spikes of Gladioli, Messrs. Harkness &

Sons were 1st, having finely-developed examples of Baroness Burdett Coutts, Conquerant, Delilah, Conte Raimbaud, &c.

Dahlias were a prominent feature, and Mr. S. MORHMER, Swiss Nursery, Farah am, was 1st, with finely-fluished blooms of Hero, John Hickling, John Walker, General Gordon, Shirley Hibberd, R. T. Rawlings, Glow.worm, Thos. Goodwin, Win. Powell, Duke of Fife, Arthur Rawlings, Mis. Gladstone, Nubian, &c.

With twelve fancy Dahlias, Mr. Mortimer was again 1st, having Duchess of Albany. Dandy, Rev. J. B. M. Cannin, Sunset, Dorothy, Mrs. Saunders, Hercules, Mrs. J. Downie, Frank Pearce, &c.

Messrs, Keynes & Co., murserymen, Salisbury, were placed Ist with twelve bunches of Pompon Dahlias, single-flowered Dahli is were also shown

single-flowered Dahli is were also shown

In the Anathen direaton for twelve Dahlia blooms, Mr. R.
Burgin, St. Newt's, was 1st; and Mr. T. Lookii, Diddington
Hall Gardens, 2nd. The latter had the best twelve and six
famey varieties. Roses, Asters, Marigolds, hardy plants, in
very fine bunches, &c., were well shown.

Ends and Vigetables were very good, and the latter especially numerous. The best collection of eight dishes of fruit
came from Mr. Emrson, who had Madresfield Court and
Muscat of Alexandria Grapes, fine Peaches, Necturines,
Apples, Pears, Plums, and Melons; Mr. G. R. Allis, Old
Window, United the absolute was 2nd with Allicante, finely Apples, Pears, Piums, and Melons; Mr. G. R. Allis, Old Warden Park, Baggleswade, was 2nd, with Alicante, finely-finished Muscat of Alexandria Grapes, &c. Collections of six dishes of fruit were also shown. Mr. G. R. Allis had the best collection of three dishes each of dessert and culinary Apples, having excellent fruits of Worcester Pearmain, Kerry Pippin, Quarrenden, Lord Suffield, Mère de Ménage, and Luie's Prince Albert,

Moone, St. Neot's, was 1st with two bunches of Black Hamburgh Grapes; and also with the same number of any other black Grapes, having finely-finished Gros Maroe.

any other mass orapes, naving mery-ministed oros marce.

Mr. Emison was 1st with two finely-finished bunches of
Muscat of Alexandria Grapes; and h; was also 1st with any
other white, having good Buckland Sweetwater.

Peaches, Nectarines, and Figs were well represented.

There were good Plums, culmary and dessert; and single dishes of Apples and Pears.

Vegetables were very good in collections. There was a struggle between Mr. T. LOCKIE and Mr. W. J. EMISON for the special prizes offered by Messrs. Sutton & Sons for six dishes, the former taking 1st prize. Messrs, James Carter & ('o, secured a capital competition for their special prizes.

WILLESDEN FLOWER SHOW AND FÉTE.

AUGUST 27. Under the title'of the Willesden Great Show there was equied, on the above date, in the White Hart Fields, Church End, an interesting exhibition of flowers, fruit, vegetables, bread, confectionery, &c. The exhibition, which remained open for three days, also included a collection of horses and dogs, while the programme of entertainments comprised athletic sports, military competitions, horse ments compared athrets speaks among grounds were dotted with marquees of different sizes, in which the various exhibits were artistically arranged. Mr. N. Reen, chairman of the Willesden District Council, performed the opening ceremony.

ACCRINGTON AND DISTRICT HORTI-CULTURAL.

AUGUST 29.—The first exhibition of this society took place in the Town Hall, Accrington - It is a spacious hall, and it was well filled. There were 124 classes under the various sections. The plants were chiefly arranged on the floor in varied designs, and the cut flowers, fruits, and vegetables were set upon tables surrounding the hall.

The 1st prize exhibitor for a group of plants arranged for effect was Mr. Daraysman, indiscreption, whose firm also obtained a special award for a large central group. The chief plants was a centre plant of Araucaria excelsa, which was surrounded with white they santhennums, then a good coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the coloured for of thready in the charges of the charges was surrounced with white this sanctions, these being in-coloured lot of Dracenas, Colens, and Crotons, these being in-termined with suitable Ferns, and enlivened with tuberous termined with suitable regins, and convened with procrous Begonius. Mr Thomas Barnes was 2nd with agroup, scarcely less effective, in which Kentias, braceaus, Pteris, well coloured Crotons, and a fine tringe of Maidenhair Furn, and varieties of Chab Moss were used.

W. H. HACKNEY, Esq. (Thos. Edsforth, gr., had some good W. H. HACKNEY, Esq. (Thos. Estatorin, gr., and some good stove plants, and his, Ferns, particularly an Advantum Farleyense, were noteworthy. He had also Begonias, the best of which were, however, contributed by A. WATERHOUSE, Esq. The best Coleus came from Mrs. BUNDERS (J. H. Wright, gr., 1997). and the best Roses, which were mostly Teas, came from Mrs Highs, T. Smedley, gr.). Mr Wattencose exhibited some good native Ferns, chief among them being several Athyrums the Crested Scolopendrium, and Osmunda regulis cristata Messrs, Thomas & Henry Clarke, Knoyden Nurseries, Ca

hibited a fine lot of single and double-flowered Begomis Indice. a line lot of single and double-howered beginns Belshas were clean and good, the best coming from Messis R. Taylor, J. C. Wolstenholmt, and Jas Shettelworth.

Fruit was not present in large quantity, but the black Grapes from Mrs. Bunting and from J. E. Rilly, Esq., the

President of the Society, were large and well-finished bounches of Hamburgh. The Muscats from Mrs. Hicks were models of Hamburgh. The Muscats from arts. He as set in the defect of form and had fine berries, but not unite rich enough in colour. Apples and Fears were not so large nor fine as it ordinary years, and the smaller fruits were past their best.

Veretables were exhibited largely, and the Cauliflow from Mr. Henry Davies and from Mr. W. M. Kenti were the Cauliflower from Mr. HENRY DAVIES and from Mr. M. KELLI were as fine in quality and of as large a size as we have seen this season. The fotatos, too, were excellent, the rougher skinned ones, as usual, taking premier positions—olery, both red and white, was exceptionally fine

NATIONAL CHRYSANTHEMUM.

SEITIMIER 1, 2, ... The first of the season's shows under the auspices of the National Chrysanthemum Society was opened on Tuesday last in the Royal Aquarium, Westminster So far as the show was an exhibition of Chrysanthemmas, it was, as usual, a comparative failure. We regard it as a matter for congratulation, that the efforts to extend the Chrysantherium season at the wrong end, which this exceedingly early fixture may be supposed to encourage continue to meet with but little success

The few Chrysanthemum blooms that were staged had but httle attrution for visitors compared with large exhibits of Dabhas and Gladioli. These afford Ugreat variety, and the flowers passess much laughter colours that is obtained in Chrys athenaums. The exhibits of fallers were not ouite so good as we have before seen at this show, but this concumstance was no doubt doe to the fact that the plants have not had sufficient time to recover from the effects of the hot dry weather, and the display at the Labor or Friday may be expected to show better quality.

The 1st prize for twenty-four timeres of the year them on blooms was taken by Mr. E. U. Ston, nonseryman. Moden head, and acceditable show the collibbt made. Among the varieties were Blushing Bride, Mr. 2016. Patcher, McLand Marie Massey, Piercy Stedling, Harvest Home, Cold let. Flores Jacantha, Parly Blush, Madanic C. Fesgronge, and others. The only clast exhibit on the class was Mr. CH. S. Staw. Hall Street, Sherwood, Notts. In this echibit the varieties that showed to best advantage were Vicontesse of Averne, Madame Corne and Madame Marie Massey, and Strathneath

The best collection of twelve blocks of the verety Mydamo.
Desgrange were from Mr. B. Calvert, gr. to Co. Accuse Horress, Hallingbury Thee, Bishop's Stirtfirl The blooms were very fine, being large, full, and pure in colour There were form exhibits, and the second place was tellen by Mr. J. Su dford, gr. to G. W. Who et Es., Fr., Wee House, N. Finchley (i.d., M.) W. Fernes, gr. to I. Nicots, Esq., Regent House, Surlaten

The variety Geo Wernig secured the starred at the class for twelve blooms of clarge flow time Chrysanthenium for Mr. F. Carlant. Indeed the since variety was slown by the winners of the three prizes in this class. The H. ones in the 1st prize exhibit were of go I resultly and most larger than the others.

Mr. Chas. Show was awarded a and price for there

Mr. Citas. Show was awarted a integer. For the expension point the ments, and a small represents the teless of large-flowered chays anthonous.

For so, hundres of Chrysantisen this creative virtues, Ardas, Watt, grid Hinney Brit, Esq. Fit folia. Avenue Hampstead, N.W., was 1st, the golder form of Violance of Desgrange was the variety combined.

For three hinneys of large Covernic Chrysantise in mag. Welling Standard the other works which in mag. Welling Standard the other works which is not a significant.

Cuas, Shaw was the only eshibitor, and games a 2nd prize Mr. J. H. Werry, Nonlocal Cometery, S.E., was awarded a Silver-galt Medal for a group of Chrysanthenium plants in flower, consisting principally of varieties of M. C. Desgrange and "few of the earlier-towering reflexed varieties, which were fringed with a band of the britten-bowered corts."

A Silver Modal was awarded to Mr. thas Sat w, no recry man, Hall Street, Sherwer. Notte, her a smaller group Some of the plants in this group were very fre ly-thewered, Madame Marie Massey, Norbert Perrier, Plushime Book, and

Barly Beauty for instance.

Mr. D. P. Crane, "A Woodynew Terrace of the way form Highgate, obtained a 1st prize for an opergue of Chrysan themun's for table descration. This consisted of Celler themines for table therefore a rais voice of the pretty and served billion had well-free throughth mass. Neverthere we shall be supported by the served billion had well-free throughth mass. graneful foliage, but were few (herysanthen mes-less, the effect was good

CTHER THOWERS.

Chatlet. Vesses ? Burthe & C. H. v. House Sureries, Cambridge, who made an extensive and excellent exhibit of Glaroli, were awarded the 1st prize for an unlimited collection. The exhibit extended almost across the available space in the building

Dublius. The class for forty-eight $\hat{t}^{(i)}$ and in not fewer than thirty-se varieties (nurserymet), was wonly Mr. J. Walling, Thame, Oxon, with an exhibit including many varieties of much excellence, and the same exhibitor wor, the class to thirty or bleame, distinct Mr. J. J. Wasa, Town Hill, Frent wood, bad the premier exhibit of twenty-functhology and doctors that of twelve-blooms distinct

In the amateur and gardeners classes, that for twenty tour blooms was taken by Mr. J. Stach with, Silverhill, St Leonards, and the class for eighteen blooms also. Mr. J four blooms was taken by Mr. . Strepwick had the best collection of twenty-for r bruches of Pompons (open), and Messrs, J. Braket. 2011. Ead the best twelve bunches

Single flowered varieties were exhibited well in several instances, Messes, J. Cheal & Sons, Crawley, winning for twenty-four bunches, distinct (open) and Mr. J. Hudson gr. to the Messes, de Rothscente, Comnetsbury House

Acton, for twelve bunches (open).

The three classes for decorative and that stowered we ricties were the most attractive, that for eighteen bunches being won by Messis, J. Chrot & Sons, with a collection in

which were included many very pretty Co tos terms. The best collection of twelve blooms was from Messrs. J. BURRELL & Co., and Mr. J. STREDWF+ was awarded lst to the class for six bunches (amateurs),

Non-competitive, Exhibits, - This section of the deplay included exhibits of Dahlias from Mr. Thos & Wart. Hale Farm Nurseries, Tottenham; Messrs, J. China. & Sons, Mr. E. F. Such, mirseryman, Maidenhead, who also contributed hardy flowers. Messrs, W. Curbusi & S.S. Illighgab Nurseries, who had also many perennial Asters and other hardy flowers and Messrs Carlet, Pa a & Wall, E.C.

With H. J. Jones, hyecroft Norseries. Hither Green Lewisham, exhibited Dahlia blooms, and minutes of Lona' Pelargonium flowers arranged effectively with I dimme

Ferns, Ac.

Mr. F. C. Foster, Brockhampton Nosse, es, Havant, had a collection of Sweet Fess., M., J. Hilboss, Gunnersbury Honse Gardens, a lew blooms of Nymphasis., Messrs, S. Stooch, & Sos, Hounslow Nurseries, Middlesex, a collection of finit, and Mr. A. Pentney, The Gudens, Worton, Hall, Saleworth, collection of vegetables

Floral Committee.

Still while I —The greater number of the subjects before the committee with Dahlias Of several new stew Dahlias staged for Certificates, one only was see essful, viz., Mrs. Stephen Walker (Mortinier), a delirate light Cower, of exqu' site form, colour light, tinged with pale publish heliotrope

Continuates were also novariled to Cartis Dahlias Startistic (Keynes & Co., the bright, soft tint of searlet. Keynes White they no & Co., delicate creamy-white one of the best white varieties yet produced, being true Cartis Prodesmaid (Keynes & to.) pale salmon, tinged with a soft shade of pink Cast is l'antasy (Burrell & Co), bright soft rel, the petals meurym, in a remarkable manner-very novel and distinct Cutus Mrs. Cordor, Slowne (Cheal & S. 188, puriosh terroestia satrue Caetus, of fine quality of act is Regulas (Purrely & Co), length to allet-crimson, very the lattice tactus form; Cortus Mr., King-lev Foster Stocdwock) (range having a thish of a soft shade of pank, Pompon Dr. Jameson (West), bright shided crin son; single, Pelly Becles (Girdlestone), despapers fine shape, Donn, Cailda, ter illestones, range only, finited purple -very distinct, and Noomi tight, jointle stone), chan yellow -writ a crimson ring round the yellow eye. Rose Mrs. Bearsey (Burnsey) received the same aware. new design in show-hoxes was commended, it was from Mr. Wells. It consists of a box 5 in her deep, the front being upon hunges, and the buck capable of adjustment by means of affixed legs. When pack I for tree lling, the Jack * let down, when the bot becomes that; a ver is then place. over the blooms and boy, which then becomes 121 melies high, and can be corled. The corners of the coops are blocked to prevent injury to blooms.

FLOWER SHOWS IN THE FYLDE DISTRICT.

to the forer spows held in the Fylio District of Lanca still last week, that at Lytham attrict deperhaps, the most attention. For years there has been no such exhibition in this salubrious pleasure resert, and the revival is due to the efforts of the Ratepayers' Association in that place. As an initial effort the show was a success. There were 180 entries divoled into two classes, one section being fimited to cottagers and artizans residing in the Fylde and coltivator their own gardens and the other oper to general competition. Preston exhibitors were well represented, and obtained most of the prizes. The display of Begonias and "specimen plants" were the features exhibition.

The Hoghton and District Flora, and Hortheultural Society heid its system the annual shew on Saturday, in the grounds attached to the historic mansion—Highton Tower, The pations included Sir James for Highton, Bart., and Lord Sale arms, M.+ The exhibition was considered the most successful yet hold under the auspices of the Society, the year having been favourable to growers; cut thewers were excep-tionally noticeable, and included some beautiful blossoms.

The same day The Singleton and Thistleton Floral and Lior ticultural Society held its annual show, this being also the 16th There was a record entry, the number being 324. In the matter of quality, too the exhibits were considered ahead of

GLASGOW, AND WEST OF SCOTLAND HORTICULTURAL.

September 2.- This society held its annual exhibition in the St. Andrew's Hall on the above date. In some of the classes, especially those for fruit, the competition was not so strong as usual, but in most of those for plants, cut-flowers, and vegetables, it was well sustained, and the quality of the exhibits was first rate. Many honorary exhibits of much excellence were staged. The platform presented a granddisplay of flowering plants, and of Palms, Dracenas, Crotons, and other foliage plants.

Pluats and Planers.—In the centre of the hall, Messis, J. & R. Thyne's large table excited great admiration. The J. N. R. THYNE'S targe rather exerted greats administration. According were probably finer in colour than any ever seen in Glasgow-Golden Ring, Prince of Wales, and angustifolia were of extra menit.

Messrs, Smith & Smonps had a large table of flowering

plants, such as Liliums, &c., in variety, interspersed with falms, choice Ferns, and Dracemas. Close to this exhibit stood a splendid table of Begonias from Mr. WARE, Tottenham, london; the flowers in form, size, and colour were excel-lent. Princess of Wales, blush; Princess May, white, crimped; and Landa, a very large single, were among the few exquisite varieties which were named.

Messrs. Double & Co. showed in their usual form, filling one side of the centre hall with the choicest Pahlias of every class. A new single-flowered variety, Lady Clare, was distinct and fine; Marguerite, single Cactus; and Queen Mary, and Vetoria were of special neit. Ther African Marigotte Lemon Queen and Prince of Wales, made a showy exhibit. I. che, Celery, and Potatos from the same firm were very perfect in form, and of much excellence.

Wr. CAMPPELL, Blantyre, had a capital display of Carnatious in great variety of colour and form , Marguerites and Camas were also included in his exhibit.

Mr MICHAEL CUTHELLYON, Rothesay, showed a fine col-fection of herba consplants, also capital Lecks, Celery, &c.,

and great numbers of new and choice Violes.

The Gleichemias from Mr. Mircuntt, of Sherwood, were deservedly placed lst; he had a arge pair of beautiful plants. Banquets were very numerous, and many baskets of flowers. arranged for effect were tabled.

A table of plants arranged for effect was set up by Mr.

A time of pints arroged for effect was set up by Mr. Millie, gr. at Auchenrau , and was awarded 1st prize; the plants were mostly of the oblaged class, and remarkable for high colour and hedth. Heaths were especially finely towered, Mr. Millier was 1st, and the 2nd prize went to

by Wilson, Westmount.
For three Orchids, Mr. Wilson was 1st. He had Cattleya Gaskelliana, very fine, and an Odontoglossum crispum, with a splendal spike; Mr. Ruib, Kennusbead, was 2nd. Among a long line (specially good of table plants), Mr. CRAIG, florist, Surling, was 1st, with Pandanues Veitchin, Croton ingusti-

folms, and Dracena superba, all very fine in coloni.

Crotons were good generally, Mr. Handsbordoom, Beechwood, w.r. let. Palms (as specimens) were lew, Mr. Wilson was let. There was a large exhibit of the finest sameties of Chadiolus from Mr. C. Main, nurseryman, Prestwick. Dahlas were numerous, Mr. Mull, gardener at Blantyre, was let, for twenty four blooms; Mr. Smith, gardener, Howood, was no gardener. was an excellent and

Roses from Messrs, J. Country & Sons, Aberdeen, were remarkable for adour and freshness, and the collection was awarded 1st prize for twenty-tour blooms; Mr. CROLL, Dundee, was a capital 2nd

There were large exhibits of annuals, Sweet Peas, Car-

nations, zonal Telargoniums, Pansies (show and faney), Lerbaccons plants, Antirchmuns, Pentstemons, Asters, Marigolds, Liliums, and other brilliant flowers.

Fruit was not equal to exhibits on some former occasions.

Messrs, Buchanan, of Kippen, had a grand display of over
tifty lunches of Cooper's Black Grapes, handsome in bunch and perfect in colour; also of Vine leaves and Tomates, which received a special award.

The only collection of fruit in the larger class came from Mr. MURKY, Culzean Castle Gardens. He had white Muscat Grapes, rather small in berry; Madresfield Court, good bunches, a nice Queen Pine, capital Brown Turkey Figs, Elruge Neetarines, Sea Fagle and Noblesse Peaches, very good; and fine Pears

In a collection of six dishes from Mr. D. McBean, were capital Black Alicante and Gros Maroc Grapes, and grand Pears.

For a collection of six dishes of hardy fruit, Mr. John

M. MILLEN, Castle Simple, had a fair exhibit, in which were

for four bunches of Grapes, Mr. Leslie, Pitcullen, Pertly, was an easy 1st, showing White Muscats, Duke of Buccleuch, Madresfield Court, and Gros Colmar.

For two bunches of Black Hamburgh, Mr. White, The astle, Largs, was 1st; and Mr. McBean was a close 2nd.

For two bunches other than Black Hamburghs, Mr. Leslies was 1st, showing fine Madresfield Court. For two bunches of White Muscats, Mr. Lestie was the

most successful.

For two bunches other than Wnite Muscats, the 1st prize went to Mr White, Blairmore, for bunches of good Foster's

Seedling.

For Black Grapes, other than Black Hamburghs, the 1st FOR DACK STARRS, SHEET THAIR DRACK MAINTINGS, 180 A to prize went to Mt. SHARRS, Falkirk, who had grand bunches of Madresfield Court, but they were not ripe.

For the heaviest bunch, a large-spreading bunch from Mr LESLIE was 1st. This was Museat Hamburgh, 9 lb. in weight. The colors was imperfect, but the flavour was first

'Apples were well exhibited in most of t e classes, the cooking varieties being of fine quality and of large size. dessert Apples were somewhat deficient in size and colour. desert apples were somewhat dentered in size and coloni. Plums were best represented by Jefferson and Magnum Bonum. Nectarines were good. Mr. Millan, gr., Tulliehwan, was 1st with good Elruge; and Mr. Leslie had a capital dish of the variety Pine apple. There were nine entries for twelve Pears, but the quality was generally weak.

Vegetables. - The hall in which the vegetables were arranged was filled throughout with as fine examples as was ever seen in the north. Cauliflowers, Ouions, Turnips, Celery, Potatos, Peas, Carrots, and Beet, were of great excellence and the competition was very keen. A collection of eight sorts from Mr. McBean was one of the best he has ever shown. Tom ites, Cauliflowers, Leeks, Onions, Cucumbers, and Celery, were of extra fine quality, and large. In a collection for twelve sorts, Mr. Hare, of Carluke, was a splendid 1st; Mr. McBean being placed 2nd by two points. A special prize for Onions was gained by Mr. Murray, Culzean, with Alisa Caig, weighing 6 lb. 7 oz., and of beautiful form. The judges and officials dined at the Grand Hotel, Colonel HARRINGTON STUART presiding. The financial statement was satisfactory, and the excellent Secretary, Mr. John Coats-Winter, was heartily congratulated upon his good management.

THE DECADENCE BOGEY.

In the face of the splendid collection of returns issued month by month from the Statistical Department of the Board of Frade—and of which a brief notice is to be found in these columns after each issue of the "Trade and Navigation Returns," there are to be found men who, not inferentially, dispute the accuracy of the figures given by asserting that "We are going to the dogs," and will seen have to shut up shop—handing over the goodwill, &c., to Germany and France. "Bogey" has been shown up 80 often, that disproving the existence of cause for alarm has come to be a sort of burden. The decadent notion has been a trifle too obtrusive of late, but fortunately an accumulation of facts is always going on at Whitehall, and as former returns had gone out of print, it was some time since arranged to have a reprint brought up to date, and to-day the decadence Bogey is rapidly heating a retreat in face of the tremendous mass of figures covering the eightysix large folio pages of the Bluebook now before us, the title of which gives a hiut as to what is within the covers :- "Comparative Trade Statistics : Sta tistical Tables, showing the progress of British trade and preduction from 1854 to 1895, in continuation of tables presented by the Board of Trade to the Royal Commission on Trade Depression, 1896; and of those contained in paper No. C. 6394 of session 1891." This extensive title gives but a faint idea of the actual contents, which relate to every branch of trade and manufacture connected with the growth and expansion of the nation and the empire, during nearly half a century. Naturally we cannot devote much space to the working out of conclusions here, but a few items may be given by the way of comparisons of British and German exports and imports. In our own case, imports are solely for home consumption, and in that of exports, of goods manufactured at home.

But before proceeding further, a few figures may be taken illustrative, not of German competition, but of our dependence on all the world for our -

SUPPLY OF WHEAT.

The imports are given in millions of hundredweights, as follows: -1854, 14.87; 1855 to 1859, 15.96; 1860 to 1864, 28.81; 1865 to 1869, 29.82; 1870 to 1874, 39.56; 1875 to 1879, 52.02; 1880 to 1884. 57.62; 1885 to 1889, 56.11; 1890 to 1894, 65.46. The comparison between Alpha and Omega is edifying as to price per cwt., the figures for 1854 is 15s. 83d.; 1890 to 1894, the price averaged 7s. $2\frac{1}{3}d$.—less than one half. The prices per quarter for the quinquennial periods above noted are as follows: -57s. 7d., 49s. 9d., 53s. 7d., 55s., 47s. 8d., 42s. 5d., 31s. 7d., 29s. 8d., and 23s. 1d. To proceed with statistics relating to-

IMPORTS AND EXPORTS.

From 1875 to 1879, British imports and exports amounted to £15 10s. 4d. per annum per head of population; from 1880 to 1884 it was £16 8s. 6d.; 1885 to 1889, it was £11 17s. 10d.; 1890 to 1894, it was £15 10s. 2d. per head.

The average gross annual total from 1896 to 1894, which was £715,000,000, is the highest total ever attained. From 1875 to 1879 the total was £632,000,000; the figures, however, represented more than double those for 1855 to 1859. From 1875 to 1879 the total fell short by £83,000,000 of the total from 1890 to 1894. For the year 1895 the total is £703,000,000—the highest total since 1892. The highest ever attained was £749,000,000, in 1890. With some fluctuations, the table noted records almost continuous progress and prosperity. Now for a few facts concerning Germany: - From 1875 to 1879 the amount of German imports and exports was £7 9s. 1d. per head, as against our £15 10s. 4d.; from 1880 to 1884 it was £6 16s. 11d. as against £16 18s, 6d, ; from 1885 to 1889 it was £6 14s, 11d, against our £14 17s, 10d.; from 1890 to 1894 it was £7 4s. 11d. against our £15 10s. 2d. Surely there is here no cause for misgiving to usthen why decadence! The foreign trade of the German Empire is less than half that of this country. From 1880 to 1884 the value of German exports exceeded that of the imports by £1,000,000 -Germany having been placed at a disadvantage by her foreign customers, and, as one writer put it, was actually carrying on her external trade at a loss. German figures have a habit, like our own, of fluctuating, for in 1879 they went up to £7 9s. 1d, per head of population; in 1894 the figures were £7 4s. 11d. Thus, it will be seen that our friends have made but little progress in 20 years.

Alarmists pointing to the doubling of our trade between 1859 and 1874, take up the cry that lower price totals sometimes show a decrease of tradeshutting their leyes to the fact that the values of inports very often decrease, and not the quantities. The trade continues good, and will doubtless continue to grow. Germany may take greater risks, and offer cheaper goods on purpose to get trade, but in the end it will be found that risky trade is bad trade, and that cheapness too often means rubbish. Sir R. Giffen has proved up to the hilt that there is no decadence in either the volume or the value of British trade,

A few figures here respecting timber and tea must be interesting to all. Growers in the land of Li will peruse the latter with deep regret - competitors in Ceylon and India having driven them nearly out of the home market.

IMPORTS OF TIMBER.

Respecting timber imports, we take a few figures respecting timber-sawn Fir sufficing. In 1860 to 1864 we imported, in millions of loads, 1:76, at £3 0s. 9d. per load; in 1865 to 1869, 223, at £2 15s. 8d.; in 1870 to 1874, 2:94, at £2 175.; in 1875 to 1879, 3:43, at £2 14s, 6d.; in 1880 to 1881, 373, at £2 10s, 11d.; 1885 to 1889, $4^{\circ}04,$ at £2 5s. 9%; 1890 to 1894, $4^{\circ}72,$ at £2 3s. 11d. per load,

We close with the following items respecting our

IMPORTS OF TEA.

The imports of tea between 1854 and 1894 are (in millons of pounds), as follows:-1854, 85:79-the price per pound, 1s. 3\frac{1}{2}d.; 1855 to 1859, 76.89= 1s. 4\d.; 1860 to 1864, 11230-1s. 6\d.; 1865 to 1869, 136:60—1s, 7d.; 1870 to 1874, 164:48—1s, 47d.; 1875 to 1879, 19190—1s. $3 \pm l$.; 1880 to 1884, 212.72-1s, 0½d.; 1885 to 1889, 221:91-11‡d.; 1890 to 1894, 239:52-104d, C.

Obituary.

MR. HENRY LAWLEY .- We regret to record the death of Mr. Henry Lawley, which occurred on Angust 17, at the age of sixty-four years. deceased was head gardener at Franks Hall, Kent, for thirty-six years, and was a much respected and excellent gardener,

LAND UNDER POTATOS. - From the preliminary statement for 1896, compiled from the returns collected by the Board of Agriculture on June 4, we learn that 563,741 acres were planted with Potatos this year, as against 541,217 m 1895, 504,454 in 1894, and 527,821 in 1895.

MARKETS.

COVENT GARDEN, SEPTEMBER 3,

We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the den net; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

SEEDS.

LONDON: September 2.-Messrs, John Shaw & Sons, Seed LONDON: Superator 2.—Messrs, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describes to-day's market as thinly attended. Trifolium, as might be expected, now meets with a decreasing sale. White Minstard continues in brisk request at full rates. There is also some sowing demand for Rye-grass, Lucerne, Cloverseed, &c. Winter Tares, with only a moderate supply, keep firm in value. Seed-rye is very steady. As regards Carry seed, there are not wanting inductions of an early advance. Hempseed also tends upwards. Blue Peas and Il irreot Beans meet with more attention.

THE WEATHER.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr. for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending August \mathbb{R}^n , is furnished from the Meteorological Office :—

formished from the Meteorological Office; —

"The norther during this week was and an unsettled Very heavy rain was experenced in the extreme north and northwest, and considerable quantities in the west generally, while in the cest and south the falls, although rather frequent, were less heavy. The inderstorms occurred in many parts of Great Britain between the 23th and 27th.

"The temperature was below the mean, the deficit ranging from 1 to 2 in the "Grazang" districts, and from 2 to 3 in the "Wheat producing" districts. The highest of the maximal were recorded on the 23rd, when they varied from 79 in England, S.," and 75 in the "Midland Counties," to 68 in "Seathard, W, and Ireland, N.,", and to 66 in "England, N.". The lowest of the minima were registered either on the 26th or 27th, and ranged from 33 in "England, S." locally at Landovery), and from 37 in "Seathard, E.," to 41 in "England, S.," Seothard, W., and Ireland, S.," and to 51 in the 1 md, 8., Scotland Channel 1st mds otland, W., and Ireland, S., and to 51 in the

"The rannell greatly exceeded the mean in Scotland, N.,

and was considerably above it in all the western custricts. In the east and south, however, the full did not differ very much from the normal

"The bright sunshine was deficient over 'England and Ireland, but was rather above the mean in most parts of 'Scotland' as well as in the 'Channel Islands'. The percentage of the possible duration was as high as 50 in the 'Chan el Islands,' but elsewhere it ranged from 58 in 'Eogland, S.W.,' and 34 in 'Scotland, W.,' to 24 in the 'Midland Counties and England, N.W., and to 18 in 'Ireland, S.'."

NOTICES TO CORRESPONDENTS.

BOOKS: J. G. British Flora, by Bentham and Hooker, together with the book of illustrations of the same Reeve & Co., 5, Henrietta Street, Covent Garden). Fern tirowing, by E. J. Lowe (J. C. Nimmo, 14, King William Street, Strand, W.C.)

CALANTHE VEITCHI: Western. The treatment most likely to induce some at least of the Calanthes to flower at the time you desire, is to keep them in the position you now have them, which seems to be a very favourable one. See that there is good ventilation in the part of the house that they occupy, and discontinue watering till the leaves have withered and fallen off. During this period tho flower-spikes will be slowly developing; and after they are well up, a little water occasionally will help them. You seem to have grown them quite correctly for early flowering.

Disfigured Grapes: Constant Reader. Your Museat berries are affected with "rust," which results from an injury to the skin received when young and tender. No one without an intimate knowledge of the circumstances under which the Vines have been cultivated, can say to which of the following probable causes the injury in this instance should be attributed. When very young, and thinning is being done, if the berries are touched with the hand, or with the head, rust may ensue. Cold draughts of air at about the same period, or a dry, parched atmosphere, or sulphurous fumes, will cause rust, and the use of sulphur upon the hot water pipes, unless carefully attended to, is liable to injure the berries at a very young stage. When once such injury is done, the berries should be cut out and removed.

GARDEN AND NURSERY DIRECTORIES: F. S. There are two published, one at the office of The tiarden, 37, Southampton Street, Covent Carden, W.C., the other at that of the Journal of Horticulture, 171, Fleet Street, F.C. The price in each case is 1s. net.

GRAPES: J. T. T. The bunches were badly shanked, and judging from the smallness of the berries, and their general bad quality, it seems that the Vine is in a bad condition. We would rather recommend you to make a new start with young Vines, and a properly-made horder, than try to improve the old ones.

MIGNONETTE: T. B. There is no fungus disease upon the plants sent, and no evidence upon them of the cause of failure. No trace of the Mignonette disease, common in the United States, can be found. The mould on some of the dead leaves is a common saprophyte. Clearly the source of falling away must be found outside the plants themselves, which cannot be predicated from the material sent. It must belong to the soil or the treatment. M. C, C,

NAMES of FRUITS: C. B. W. We cannot undertake to name varieties of Tomatos. Both of those you send are of the Perfection type, and there are now so many varieties of that type, that between many of them there is no essential difference. -F. Wicks. Plan, Prince Engelbert.—Paddy from Cork. Apple, Keswick Codlin; green and brown Pear; Comte de Lamy; yellow Pear, over ripe. -J. Kitten. Apple, i, Heary Morning; 2, not known.-W. W., Fejeshire. 1, believed to be Lord Grosvenor; 2, Bedfordshire Foundling; 3, Rymer; 4, Tower of Glamis; 5, Reinette du Canada; 6, not known.—J. P. 1, Sugar loaf; 2, Frogmore Prolifie; 3, Williams' Favourite.—II. W. Plum; Jefferson; 1, Pear Williams' Eon Chrétien; 2, fruit spoiled in transit, Bonne of Jersey. Apple: 1, Emperor Alexander; 3, Cellini.—C. K. 1, Duchess's Favourite; 2, Forge. The specimens of Plums were not sufficiently good for the purpose of identification.— A. R. C. 1, Louise Ponne of Jersey; 2, Beurré d'Amanlis; 3, Belle de Bruxelles; 4, not known; 5, Duchesse d'Angoulème; 6, Josephine de Matines; 7. Apple, New or Winter Hawthorndon, J. B. Pear Souvenir du Congrès; Plums, 2, Kirke's; 3, Jefferson: 4, not known; 5, Prince Englebert or

Mitchelson's, -Aber. Your fruit is unknown to us, some old Scotch sort, not grown in the south.

NAMES OF PLANTS: Correspondents not unswered in this issue are requested to be so good as to consult the following number.—W. V. 1, Prunus Pis-ardi; 3, Adiantum cuneatum: 4, Acer Negundo variegatum. —A. B. C. 8, Spirea bella, if the flowers are pink, not a good specimen; 9, Calycanthus floridus, probably—send when in flower; 10, Eryngium amethystinum. — T. W. R. Acer circinnatum, Pursh. — ti. H. 1, Caladium bicolor; 2, Prince Albert Edward; 3, Birraquini; 4, Chantini; 5, E. G. Henderson; 6, Mayerbeer.—H. D. M. W., Dumbarton .- Juneus supinus var. - E. James, Enfield. 3, Ceratopetalum glandulosum; 4, Melaleuca?—flowers arbnormal; 6, Chironia linioides.— J. A. Chenopodium acutifolium, British. -N. J. H. Euphorbia Lathyris, so far as may be judged from the one leaf sent.

OMISSION: SHREWSBURY HORTICULTURAL SOCIETY'S Show, -We are requested by John Cowan & Co., Limited, Garston, Liverpool, to inform our readers that a Gold Medal was awarded them for a group of Roses; and Messrs. Laing & Mather state that a Silver Medal was awarded them for a collection of Carnation blooms, and a Certificate of Merit for a stand of their new Carnation Viscountess Mel-

PEAR WITH INTERNAL BROWN SPOTS: A. B. The Pear sent showed no external sign of disease, but when cut the flesh was found to be disfigured by large brown spots deeply scated in the flesh, and mostly harder than the surrounding substance. The microscope revealed no mycelium, or any other trace of fungus, and hence it is difficult to account for the spots. When cut and exposed, the spots protrude, resembling a sort of gummosis, many of the cells being dissolved. We are at a loss to suggest a remedy. M. C. C.

ROSE SHOOTS DYING: C. W. D. The result of a lack of nutriment in the soil, or because owing to long drought the roots could not take it up.

SEEDLINGS OF PINUS: D. Marl. The roots have been eaten by the larve of the weevil Otiorhynchus niger. The needles first become yellow, and finally dry up. There is nothing for it but change of ground for the seed beds.

SPOT ON CARNATION LEAVES: B. C. When the disease has gained a footing on the plants, it will gradually over run them, and there is no known cure for it. Perhaps the occasional use of the Bordeaux Mixture in mild form on all of the plants before any spotting is observable might prevent an attack. We would advise the destruction of the plants forthwith by burning as the only means of stamping out the disease.

SYCAMORE LEAVES WITH BLACK SPOTS: J. B. The black spots are eaused by a fungus, Rhytisma accrimum. In July yellow spots or blotches are seen, which in August turn black, and the leaves usually fall early. There is no known means of cure or prevention beyond raking up the leaves and burning them. not letting them by although a little of the leaves and burning them. burning them, not letting them lay in ditches, or in the grass under the trees.

TENANT'S GLASSHOUSE: Nurseryman, So long as you do not fix the superstructure with bolts or revews to the foundations of bricks laid in the soil, it remains your property, and you can remove it at will.

TOMATOS AND BORDEAUX MIXTURE: S. H. D. A somewhat diluted form of this mixture may be used on Tomato-plants carrying green fruits, because it can be washed off them before they are fit for use; but we would not advise its use on plants with ripening fruits.

Tomatos and Chrysanthemums: J. II. It is a common thing for Tomatos to go in the manner yours have, and the cause is attributable to a check, most probably at the root, at some stage of their growth. Sometimes the injudicious use of liquid-manure will cause it. The Chrysanthemums were doubtless injured by insects (earwigs), in an early stage of their growth, and the injury then searcely visible has developed with the growth of the plants.

AND SIXPENCE FOR EVERY ADDITIONAL LINE. If set across two Columns, the lowest charge will be 20s If set across three Columns the lowest charge will be 30s. Page, £8; Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

NOTICE TO ADVERTISERS .- In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others .- It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to 11. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY

 $ORD\check{E}R$.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United Kingdom, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SPECIAL OFFER.

To induce Gardeners to Test and Prove the value of this remarkable Manure, we will deliver, carriage free, to any tation in the United Kingdom, 1 cwt. of "LE FRUITIER" for 20s., including with each order, 1 bag of FERTILISING MOSS, the new and most successful med um for Plant Culture. 33 Silver and Bronze Medals and Diplomas awarded to

VALUABLE ORCHIDS.

About 3000 fine Specimens of RARE ORCHIDS has just arrived, in splendid condition, in Europe, of which a great many have been rathered in bloom by an experienced Collector, from quite new localities. A great number are natural hybrids, and unique Olontozlossums; they have been painted by him. Also, there are over fifty amongst them that will be guaranteed unique types, and not existing in Europe. The best of Oncidiums, rare varieties; Cattleya Pyanie (after locality), the new labiata April-flowering Cattleys, Cattleya labiata, with its wonderful varieties. Some of these are with over 100 bulbs.

its wonderful varieties. Some of these are with over 100 bulbs.

Azulea, the finest Cattleya in the u.r.(d. large plants, but only a limited number; they were collected in bloom, and there are also pure whites amongst them. There is also a new variety of Cattleya autumolals, which flowers in its native country at Christmas; large sepals and petals, dark or misoned. Also an unique Cattleya, wonderful variety, grown in an antique Indian-pot; also Cattleya Mossile albi, C. Reineckiana, C. Wagneri albis, and C. Perivallians alba. Dried flowers, and painted by the Collector.

Not any of the above mentioned will be divided, and the advert per would prefer to sell them in one or two lots, or the whole consignment to one party.

The Unique Plants consist of CATTLEYAS and ODONTOGLOSSUMS.

The whole have been placed in a private gentleman's hands, and they will be guaranteed by him. Address letters only to —

F. HAWKER, 40, Armoury Sq., Stapleton Rd., Bristol.

H. J. JONES, HITHER GREEN, LEWISHAM.

FROMOW AND SONS beg to draw the attention of Planters generally to the extensive and varied Stock at their Nurseries at Windlesham, Bag-hot, Surrey. The plants are all very carefully grown, and cannot possibly be in better condition for removal, everything having been transplanted within two years, and much of it during the past season. There is a much larger stock than in Mr. R. Mason's time, W. F. & Sons having added a large farm at Astage Hill, adjoining part of old nurseries, which is well stocked with good and useful things well worth inspection.

Descriptive Catalogues on application.

Gentlemen visiting the Nurseries would be met at Sunningdale or Bagshot Stations by appointment.

The following are a few items of the Stock to difer.—
100,000 SHAUBS, for potting, boxing, and winter-gardening.
30,000 DWARF and CLIMBING ROSES.
6,000 STANDARD ROSES.
6,000 STANDARD ROSES.
6,000 PRIVET OVALIFOLIUM.
47,000 RHODODENDRONS, named Hybrids and Scedlings.
50,000 SENKALE, for forcing.
50,000 SE

THE

Gardeners' Chronicle.

SATURDAY, SEPTEMBER 12, 1896.

THE POET LAUREATE'S GARDEN.

WE are always anxions in these days to know as much as possible about our celebrities, and when any of them are interested in our favourite pursuit, it is only a laudable curiosity which leads us to enquire about their surroundings. The Poet Laureate has thrown himself so thoroughly into our very best style of gardening, and has written so charmingly about it, that we feel sure the gardening world will be glad to hear something about his home. Here we are met with an initial difficulty. In his two delightful books, The Garden that I Love and In Veronica's thurden, he has so explored every nook and corner, and has described it and its contents in such graceful language, that our more prosaic account of it will disappoint many of our readers; but we have not all a l'egasus at our command, and cannot invest even common things with the charm of refined prose or flowing verse.

Swinford Old Manor, the home of the Poet Laurente, is situated within two miles of the town of Ashford in Kent, and on the borders of Godinton Park, of which estate it forms a part. It is in the midst of truly Kentish sconery: we have the park on one side and on the other a country road, well wooded and shady, which in this county we call a lane; there are hop-gardens around, and much of that soft restful beauty which so gladdens those who are true lovers of nature. We have called it the home, not the residence, of Mr. Austin, for we think that word more correctly conveys the idea of its character (see fig. 56, p. 300). There is nothing of grandeur about it, but a quiet homely aspect natural enough, for it was not very long ago a farmhouse, and it owes but little of its attractiveness to situation, and when we come to write of the garden, we have not to deal with a place where lavish expenditure is bestowed upon everything connected with it, but where the beautiful effects are due to the fine taste and cultured refinement of its owner, and not a little to the fair mistress herself. There are some few things which seem to have been borne in mind in its arrangement; no flower or plant has been excluded because it was common, nor have any been admitted simply because they were rare, and thus flowers of all kinds, annuals, perennials, flowering shrubs, Roses, alpine plants and bulbs, all find a place here. There is, however, one class of plants that is rigidly excluded - what the owner calls invalids; if a plant exhibits what gardeners call "miffiness," and requires coddling, the owner will have none of it, however rare and beautiful it may be. Nor is there any adherence to any one particular style, to the exclusion of all others; and there is a partial system of bedding out with a much larger portion of mixed borders. Some persons throwing off one system rush to the other extreme; the place where bedding out has been carried to its fullest extent is all at once so changed that no trace of it is to be found. Now this, while very English, is very unwise; therefore one is glad to see a combination of both systems. Then, again, Mr. Austin greatly objects to having large bare spaces in his borders or beds, consequently the former are filled up, and everywhere an abundance of bloom meets the eye, and while the garden presents the appearance of being thoroughly well kept, there is no sign of primness about it. Of the two approaches to the house, that through Godinton Park is, without doubt, the one to be preferred. We come then upon the splendid Oaks, Beeches, Elms, and Hawthorns which adorn it, and pass by the Chestnut bole of which mention is made in In Veronica's Garden, a grand landmark for all the country round: the road afterwards leads you in front of the old Tudor House, in which are some of the choicest bits of the architecture of that period anywhere to be met with, the hall and staircase being especially beautiful. One can hardly help indulging in a regretful feeling in looking at it, when we recollect that it has now finally passed out of the possession of the family who have held it for generations, although it must be said that the present owners are likely to do everything in their power that can add to the beauty and dignity of the place.

It is only a short distance after you have passed this house that you come directly in front of the Poet Laureate's home, and at whatever season of the year the visitor approaches it, he will find a scene of brightness and beauty. We have seen it at various seasons: in spring, when the early flowers of the year come to tell us that winter is gone; and we have seen it in autumn, both early and late, and we must confess our preference to it at this later period, for although it is quite true, as the poet has pleasantly written, that we can do nothing of any moment with the garden then, there is the restful feeling that you may leave it all "in its quiet, sunny, self-complacent serenity.' "There is a quiet assurance of unbroken weather. of daily sunshine tempered by white billowy clouds, that move not, and that contain no menace of rain. The shadows on the lawn are very long and very soft, the fruit mellows on the wall, the Sunflowers extend their golden discs athwart the garden-paths, and the second bloom of the Roses is more tender, more touching than the first." Is there anywhere so charming a description of the garden in autumn as is contained in this chapter of his book?

In the spring the beds on the lawn are filled with Forget-me-Nots, out of which rise yellow Tulips, with their golden cups; while all around in the borders are to be found Primroses, Polyanthuses, Datfodils, Snowdrops, Chionodoxas, and all the various bulbs which go to make up the beauty of our spring gardens—and the beds of Tea Roses are throwing up their brilliantcoloured young shoots. The bulbs are replaced in due time by Begonias, Pelargoniums, and other bedding plants, while all round the borders herbaceous plants. Cannas, especially the dwarfflowering Gladiolus-flowered varieties, assert themselves and afford both glow, varied colour, and richness of foliage to the garden; annuals also are used with no niggard band, and add greatly to the interest and variety of the garden.

The last time we were there the owner was in tears, metaphorically speaking. "What is one to do." was his exclamation, " with a garden in such weather as this? not a drop of rain for weeks, and although the well has not failed, yet it has been hard work." Still the garden did not bear much evidence of the drought, although there were more bare spots of earth than suited the taste of its owner, and the lawn was a little browned: vet to the ordinary observer all looked very bright and pleasing. The house is now being added to, and there was much consultation as to the Roses with which the new part of the building should be covered, for the poet has, like ourselves, a strong feeling that an English country residence ought not to exhibit blank, staring walls, but be covered with the very best things that can be obtained. It may be that in our chimate we do not require the shady groves which are ever the theme of those who praise the sunuy elimes of the south; but we

the completion of which the whole of the third and concluding part will be devoted.

Most of the genera described include species of great horticultural interest. This is especially the case with Crinum, Nerine, Cyrtanthus, and Hæmanthus, which belong to the former family, and with Asparagus, Kniphofia, Gasteria. Aloe, and Haworthia, which belong to the latter.

Two points suggest some remark. A considerable number of species appear never to have been collected but once. Many are still only known from descriptions and figures published in the last century, and are unrepresented in herbaria. It is difficult, however, to believe that any are really extinct. The fact is more probably accounted for by the extremely local limitation of species in South Africa, which is hardly parallelled in this respect by any other flora in the world.

In the case of succulent genera such as Aloc and Haworthia, herbarium specimens are lamentably deficient. But Mr. Baker has had the advantage of having had under observation for years the collection of succulent plants at Kew, which in extent is

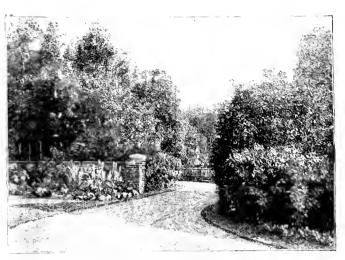

Fig. 51.—A GARDEN SCENE. (SEE P. 295.)

do want our houses to be clothed with beauty, both of foliage and flower. Such, then, is our Poet Laureate's home, which may lack the romantic charms of those of some of his predecessors; it is not a Rydal Mount, but it is a fitting home for one who is so intense a lover of nature and of the beautiful as is Mr. Alfred Austin. H. H. D'Ombrain. We are indebted to the kindness of Messrs. Macmillan & Co., the publishers of Bedford Street, Covent Garden, W.C., for the illustrations accompanying this article. Ed.

NOTICES OF BOOKS.

"FLORA CAPENSIS." *

The second part of the sixth volume of the Flora Capensis needs but a few words of introduction. Like the first, it is the work of Mr. J. G. Baker, F.R.S., the Keeper of the Herbarium and Library of the Royal Gardens, Kew. It contains the continuation of the Amagylidese and part of the Liliaceae, to

The Coperatory stem the description of the plants of the Coperatory, Cothering and Port Natal Could neighbouring territories), by cursus botanists (London Reeve & Coperatory, Herniette Street, Covent Gorden, London, W.C.)

undoubtedly unique. Many of these have been, in all probability, under cultivation at Kew since their introduction in the last century. The advantage of consulting living specimens is of peculiar advantage in describing the Petaloid Monocotyledons. But in the case of the succulent genera, it may be safely said that, without it, the task would not be possible at all. Unfortunately when the majority of these plants were introduced, little importance was attached to their exact localisation; and this, therefore, for the present, must remain for the most part undetermined.

I have again to express my obligation to Mr. N. E. Brown and to Mr. C. H. Wright, assistants in the Herbarium, for their valuable assistance in the work of passing the sheets through the press. And I must remedy an omission in expressing my thanks to the well known South African botanist, Mr. H. Bolus, F.L.S., for his great assistance in revising the very intricate topography W. T. T. D., Kew, August, 1896.

Soils and Moulds used in Horticulture.

A useful little treatise has been compounded by Mr. George Truffaut," on the soils, moulds and composts used in horticulture. The work is prefaced by Professor M. Dehérain.

The book consists of cleven chapters, dealing with the relations between plants and soils; the end and aim of horticulture; the origin and properties of the soil, and their classification; plant nutrition, and the

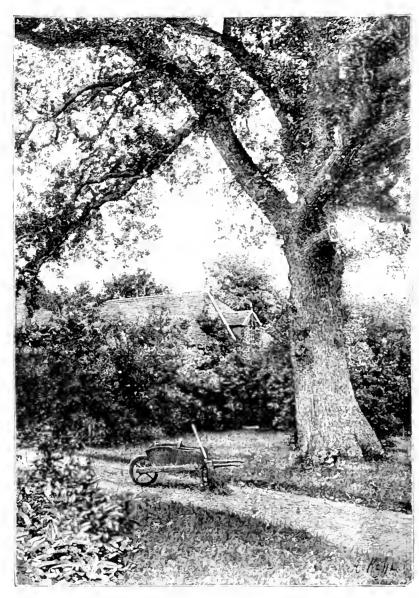

* Paris: Octive Doin, Editeur, S, Place de l'Odéon.

importance of suitable waterings; influence of temperature on plants and their roots, especially as affecting the subsoil; garden moulds and the manure best adapted for successful plant growth; concluding with examples of proper culture as exemplified by experiment.

The development of horticulture is said to be immense and increasing in importance day by day. The production of vegetables, fruits, and flowers out of season is continually assuming greater proportions. Flowers are associated with all our joys and all our sorrows: with them we cover our tables and decorate

preparation of his soils and applications of his manures for the production of vegetables, fruits, and flowers, as by the farmer in the growth of his grain and root crops. The numerous facts revealed by experiment and chemical analysis may be put to the best interests of the horticulturist, and to the increase of his profits.

The author, Mr. G. Truffaut, who has been brought up in the notable establishment in the Rue de Chantier at Versailles, has lived all his life in the midst of herticultural work, and well knows the difficulties and requirements of the cultivator. His

our dwelling-houses, we beautify our marriage feasts: and when one we love or respect is borne to his last home, the grim cotfin is concealed with wreaths of flowers. Not only in France, but in England, Russia, and other Continental countries, this beautiful practice is extending, and imparts a stimulus to the export trade.

Agricultural science, which dates from not more than sixty years ago, and which even now may be said to be only beginning its career, is, however, commencing to derive advantage from the immense amount of research brought to bear upon the subject. The investigations in regard to plant-life generally may equally be applied by the horticulturist in the

little work has been is ... with the main idea of assisting his coadjutors in the various departments under their care.

The first part of this work is devoted to the study of soils and their formation. The author treats successively of the soil as a sistainer for plants; then as a source of reserve for inclinequirements. In the second part he passes in review the various moulds employed in horticulture, and enumerates the plants to which these different soils are most suitable, and points out what manures ought to be used in conjunction with each kind of soil in order to secure the maximum returns.

The horticulturist frequently composts the moulds

which he uses. These methods are described and commented upon. After having given in Chapter X, a brilliant example of what may be done by rational modes of cultivation, as illustrated by results, which should prive a fair guide to the proper selection of manures, the author instances the case of Azalea indica, a plant deservedly popular, and which, cultivated according to fixed rules as to soil and manure, makes such rapid progress, that the plants can be placed upon the market at a much more rapid rate than formerly.

The author has certainly done good service to the cause of horticulture, and in his conclusions he says he shall consider himself especially fortunate if, in the course of his labours, he has been able to remove some of the absurd prejudices which stand in the way of advancement, and more than all, draw the attention of his contemp raries to these questions, which ought certainly to be held as most important to the horticulturist of the present day.

The author laments, and with too much cause we think in the average gardener, the lack of knowledge in horticultural chemistry, and this, notwithstanding the immense amount of research in agricultural chemistry, the sister science, which has been carried on during the past fifty years.

Artificial manures, which a few years ago were but comparatively little used, and less understood, are now purchased by millions of tons.

In these days of agricultural depression it seems, according to the ideas of the author, only reasonable that more attention should be given to horticulture generally, and especially to that department of growing garden-produce for market. The conditions of culture possible of attainment, and the high price of products obtained out of season, all favour the borticulturist. The author concludes his capital little work with the statement that the day will arrive whom national horticulture, guiled by science, will evercome the competition of foreigners, and the immense productiveness of the garden will tend to increase the wealth and prosperity of the nation. J. J. Willie, Harquallen.

VEGETABLES.

EARLY MILAN TURNIP.

In regard to gal knows of rowth, the Six-weeks Stone Turnip was exceededly the Purple-top Munich, and the latter by Early Mulca. Whether we shall ever get a galaker grower than Mulan remains to be seen. On Judy 23 Mr. W. Andrews gr. to Mrs. Dunby, Elmfield. Exeter, sowed Early Milan, and on August 29, that is exactly one month afterwards, he pulled Turnips from the patch measuring from 7 to 8 inches in circumference. All of the conditions were favourable, viz., a rich soil, good situation, and fine warm weather; but even with all these alls, it shows the very rapid growth of Early Milan. A. H.

FRUIT REGISTER.

BLACKBERRY, THE WILSON JUNIOR

A FEW years ago, the above-named Biackberry was e-instantly the subject of remark, but it disappeared almost as suddenly as it came to us, possibly because the plant did not succeed, on this side of the Atlantic, to the degree we had expected from the high reputation sent with it. Having tried it myself in various positions our more than one occasion while at Ketton, with very little success, I was surprised to find it growing vigorously, and fruiting well at Cowdenknowes Gardens, Berwickshire, the young growths being upwards of 12 feet long. Mr. Robertson had planted it in a shady corner, against a wall with a south-east aspect, where it had plenty of moisture at the roots. It would be interesting to hear of other gardens where this fruit has succeeded, and the conditions under which it has done so. W. H. Durre.

POTATOS AND MANURES AT READING.

On Saturday, S ptember 5, a large party of gentlemen, scientists, technical educationists, agriculturists, horticulturists, representatives of the Press, and others, assembled in the Abbey Hall, Reading, on the invitation of the distinguished firm of Messrs. Sutton & Sons, and also of that of the committee of the University Extension College, Reading. The first duty, and a very pleasant one, was partaking of the hospitality of the firm, in the form of a capital luncheon, over which Mr. Martin J. Sutton presided, being supported by Messrs. Herbert, Arthur W., and Leonard G. Sutton, the other members of the firm. At the conclusion of the repast, and after the one toast of "The Queen and the Royal Family" had been proposed from the chair, Mr. Gilchrist, Agricultural Director to the Collego, made a short statement with respect to the special purpose of the gathering, which was to examine the results of various experiments on Potatos with diverse manures, or none at all, the place of trial being Messrs. Sutton & Sons' seed-farm, which had, with the necessary tubers, been generously placed at the disposal of the College authorities for the purpose. Mr. Walter Palmer proposed, and the Principal of the College seconded, a hearty vote of thanks to the firm for the great assistance rendered in the experiments, and also for their kindly hospitality that day, to which Mr. Herbert Sutton and Mr. Arthur Sutton responded, the latter referring to the trials generally, and also as a matter of interest drawing attention to some Winter Cherry and Egg plants in pots on one of the tables, all of which were growing on Potato roots, thus producing tubers and fruit simultaneously. Very many experiments of this nature have been made at the nursery this year, and no doubt more will be heard of them later. The party were now invited to proceed to the farm, a large number of breaks being provided for the purpose. Having arrived there, Mr.

Gilchrist became the conductor and expounder of the trials. The Potatos, which were chiefly of the Sutton Flourball, a red round, but not to be confounded with the old red-skinned Flourball, had all been lifted from the respective breadths, and carefully weighed. then placed in heaps by the sides of the paths intersecting the plots. The few very small tubers, in each case not amounting to ten per cent., being laid in a small heap close by. The tubers seemed to consist generally of two thirds ware, or eating samples, and the rest forming good round seed, hence these were all described as marketable. The soil has been some years in cultivation, and is a free loam resting on gravel. Analysis shows that it was in very fair fertile condition, though in no sense rich in plant food. The chemical analysis would be understood of only by chemists. Some similar trials were conducted last year on the same ground, hence it was resolved that the first set or group should have no manures added this year, but a careful record of the previous year's manurings of the soil had been kept, hence it was possible to test the value of a second year's effect of manures unappropriated by the previous season's crop. Due, no doubt, to the great dryness of the summer of 1895, and the comparative dryness of the following winter, the manurial residue in the soil seems to have been considerable, as in nearly all cases the results were very satisfactory. The table of results in all the four diverse sets or plots here inserted shows that matter fully. In going through this table it must be understood that the cost of manures furnished in the first column applies in relation to the first set or group only to those given to the soil the previous year. In all the other three sets or groups following, the cost applies to the present year. Practically, the entire produce obtained from the whole of the first set cost nothing for manure this year. In each case the column under the head "Marketable" shows what portion of the crop is profitable. The next column gives the quantity of those too small for marketing, though having value as poultry or pig food; the third for disease, it is worthy of note, was a blank throughout, not a single diseased tuber having been found [and we therefore do not give it. En.]; and the fourth column gives the total produce. (See Table I.)

Readers will, on carefully scrutinising this table, not fail to have noticed that there is much that is erratic in the results, and some of these are not only unexpected, but contradictory of what is found in other cases. It is in such ease practically impossible to draw from the table any definite conclusions. Practically, looking at the results of the first set or group, and deducting cost of manure in this case, none having been applied, it really scems as if better results had come from nonmanuring than from manuring, at least, in a pecuniary sense. Yet it would never do to assume that repeated non-manuring would end in good results. Again, we see such varied results in diverse plots from the application of the same manures, showing how difficult, indeed unfair, it would be to draw definite conclusions from one year's trial, especially in such a year as the present one so far, has been. In the set 2, the whole of the manuredressing of 1895 was repeated, but with the exception of the nitrate, which was applied in January. It is distinetly noticeable that good dressing of nitrate in the manure gave extra strong top growths, but in few cases was the tuber productiveness so great as might, in consequence, have been anticipated. It is well to understand that very strong tops do not by any means always indicate a heavy tuber crop. or group 3, the ground, not having been previously manured, was dressed as per table in January last; and in set 4, the whole of the munures were applied, at the time of planting, in April last. It is noticeable that whilst the freshly-applied farmyard-manure gave the best results from the spring-dressing, probably because of its moisture imparting properties, the winter dressings of the artificial manures, in set 3. gave better results than do spring-dressings, doubtless

because they became more completely dissolved in the soil. Altogether, it is made very obvious that only by conducting a series of experiments, here made so comparatively easy through the generous help of Messrs. Sutton for a series of years, can any practical conclusions be made to result. Thus, had last spring been wet, the beneficial effects of winter dressings with artificials, as found in the past season, might have been entirely absent. In the same way dressings, when the tubers were planted, would, in a wet season, be found almost immediately active; could we but foresee the probable nature of the weather, we should better be able to regulate manurings accordingly. In the case of farmyard manure, so-called, though probably really ordinary stable manure, nothing was mentioned as to its condition when applied, whether fresh and full of manurial elements, or whether in an exhausted or wasted condition, as farmyard manure ordinarily is. If anyone will turn to Table I., he will find that where farmyard manure, twenty tons per acre, is added to an ordinary dressing of artificials, the product is rather less than where farmyard manure alone is applied. Thus the inference would be that the one dressing only was active, or one was neutralised. More remarkable still is the fact that the entire product was the same exactly as the product where no manure whatever was this year applied, as seen in No. I plot of the set. Then, again, the entire dressing of farmyard manure and artificials is calculated to cost £6 15s. 9d. per acre, whereas the first plot having no manure was all profit. Obviously, the closer we examine the return or table, the more are we mystified, and the greater the need shown for a spreading of these experiments, which Mr. Gilchrist so admirably controls and tabulates, over a series of years.

In Table 11., again, we see remarkable products from unmanured plots, as compared with those dressed with the various manures named in the margin. Thus plot No. 1 in the fifth set gives better results without manure than does plots 6, 7, and 8, to all of which, at an average cost of 26s, per acre, various manures were added. Even where there were increases, they were not relatively considerable. In set 6, the manures being applied in January, the results were relatively much smaller. The sort in this case-trial was Magnum Bonum.

WEIGHT OF TUBLES FOR ACRE.

Table III, shows the effect of spraying with a solution of sulpliste of copper 20 lb., and of lime 10 lb., added to 100 gallons of water. The two varieties sprayed were Flourball and White Elephant, the dressings, from a knapsack sprayer, being applied June 18 and July 11. Here we think the applications were, for the season, made too early; indeed, it is remarkable that even now, September 6, late Potato-tops are green and vigorous, almost beyond precedent—at least. for many years. The result shows that the spraying led to a trifling increase on Flourball, but an appreciable decrease on White Elephant. This is doubtless due to the mixture being, though relatively not strong, yet too much so for the tender leafage of the Elephant. Here we must close, but would tender both to Mr. Gilehrist, for his kind and able exposition of the trial results, and to the Messrs, Sutton & Sons, our warmest thanks for their exceeding courtesy, as well as generous efforts to make these experiments a real success.

ORCHID NOTES AND GLEANINGS.

ORCHIDS AT MOUNT HARRY, BRIGHTON.

The chalky road leading from Preston Park to the residence of R. G. Fletcher, Esq., plainly shows the kind of strata found in this district and in the gardens themselves. The surface-soil, although of good loam, is thin and mixed with chalk, and not altogether favourable to good gardening; but in consequence of the pure, humid air and the salubrity of

the situation in this high locality, excellent results are obtained in every department by Mr. Jones, the gardener, whose management of the Orchids especially is more than ordinarily successful. The latest addition to the plant-houses was, we were informed, a commodious lean-to devoted chiefly to the cultivation of Dendrobiums, and in which a number of plants of Dendrobium Phalænopsis Schroderianum are at the present time making a splendid show, the flowers varying in tint from pale rose and white to rose and purple. The lightcoloured varieties, which are the favourites here, predominate; but taken as a section they form another proof of the oft-repeated observation, that this fine species is one of the most satisfactory of Orchid importations ever received. On one side of this house there stands a gigantic Dendrobium Dalhousieianum -perhaps the largest in the country-which lately bore eighteen flower spikes; and beside it are ranged a number of plants of D. formosum giganteum, profusely furnished with lurge, pure white-and-yellow blooms. Here, also, were noted in bloom good plants of Vanda corrulea; Cattleya granulosa, C. g. Schofieldiamun, and also a very peculiar form of the same species; C. velution, and Zygopetahun Mackayii grandiflorum, a very large and beautifully coloured form of the fine old species. On the back wall the Dipladenias and Gloriosa superba were finely flowered. On the shady side of the warmest house a few plants of Phalenopsis were making satisfactory growth. These plants have steadily improved for some years past, a fact that is worthy of being recorded.

One very pretty form of P. amabilis had a fine flower-spike, although it was said to be inferior to one which had gone past. Here, too, were plants of warm-house Cypripedium, some of Augraeanm Scottianum, and other species of Augraeanm in bloom.

In most of the houses in which Orchids are cultivated, stove plants are also grown, and in those in which the stove plants predominate, use is made of suitable spots for special subjects, and to this skilful use of the best means at command many successes with Orchids are due. In a bright, sunny part of one house a fine batch of moderate-sized Leelia purpurata was noted, some of which have each borne recently from four to nine flower spikes. In an airy and rather shadier position were remarked some grand specimens of Sobralia Veitchi and S. xantholenca, which, when in bloom, must have been fine objects. In an adjoining house were grand specimens of Eucharis, for which these gardens are noted, and which each bear about one hundred spikes in their season.

At one end of another house more plants of Den drobium Phalanopsis Schröderianum were grouped, and with them were a fine plant of Auguloa Ruckeri, some of Cattleya aurea and others, Oncidium prae textum, Odontoglossum Pescatorei, &c.

Grapes and Tomatos are well cultivated under glass; and the Apple-trees in the open garden were splendid examples, the crop good, and the fruit of unusual size, which are, as is usual on the chalk, beautifully coloured. In the shady walk leading to the gate, plants of Cypripedium spectabile, and other hardy Cypripediums, are said to be among the most satisfactory of hardy garden plants.

THE ROSARY.

ROSES FOR CLOTHING WALLS.

"What Roses would you advise me to put on that part of my house that has been lately added to was the question lately put to me by my neighbour. The answer to this has led me to think the whole subject over, and to ask how it is we find so many bare walls both on dwellings and out-buildings, which might be beautified by planting some of the varieties of stronggrowing Roses of the Tea and Noisette sections, which are nowadays used for such purposes? There are many things to be taken into consideration in answering the question: aspect is one of these, for if we plant such Roses as William A. Richardson, or

L'Idéale on a south-wall, where they get the influence of strong sun, the colour gets almost bleached out of them. I have a plant of the former in just another such a position-although it is doomed, which never shows a flower of the beautiful bright orange tint so peculiar to it, but is almost white, and therefore valueless. Again, people imagine that an east aspect is bad for Noisettes. I have a couple of grand plants of Madame Bérard and Rêve d'Or on the east side of my house; the former of these has never suffered in the least from its eastern aspect, and although the latter did a good many years ago, and so severely that I thought its days were numbered, it was in a winter when thousands of plants heretofore accounted hardy succombed. And it has now covered the space which it formerly occupied, though, for other reasons I have not allowed it to grow quite so high. I do not, therefore, think that, in these southern counties, there is any reason why the Noisette Roses should not occupy the quantity and closeness of its foliage—in fact, it is almost evergreen.

Longworth Rambler.—Of all the dark colours of so-called climbing Roses, I give the preference to this variety. I prefer its colour very much to that of either Reine Marie Henriette, which has been described as a crimson Gloire de Dijon, or to Cheshunt hybrid. It has, like the preceding Rose, an abundance of foliage, which in such a winter as the last it never lost; it gives one also a good number of autumnal blooms, and though the flowers are somewhat loose, their colour makes them very acceptable. As to its vigour there can be no doubt; I have to cut out barrow loads of wood every year, and it will soon reach the top of my house if I allow it to run on of its own sweet will.

Climbing Deconicusis.—This is one of those Roses which requires a warm corner on the house. Besides Tabbitt's original strain, there are apparently others

I have a plant of it now on my house which on this 28th of August is covered with fine blooms. These are oftentimes of excellent shape, and bright in colour; very often, however, the blooms become cleft—a fact which does not destroy their effectiveness. There has hardly been a week since May when we could not have cut blooms from it, and it will continue to give us blooms for some weeks yet. Its growth is not quite so long as in the type, so that the plant becomes better filled in.

Madame Bérard more closely resembles the original than either of the preceding; it is very hardy, and stands the severe winters unprotected, without sustaining any injury. I have endeavoured to correct its lanky habit by occasionally cutting back one of the long shoots, though this is not generally a good thing for Noisettes; and by thus inducing it to throw out fresh shoots, one gets the plant in more compact form.

Bouquet d'Or.—One of the best of the race of

Fig. 56.—" Not altogether exiled from the garden that I love." (see v. 295.)

From "In Veronica's Garden."

this position, and I may say, also, that in this south-eastern corner of Kent we get the full effect of the easterly winds. While there are many rampant growing Roses which are very desirable for many situations in gardens, such as hedges, banks, &c., they are not varieties which I should choose; such kinds as Dundee Rambler, Félicité-Perpétue, Thoresbyana, and the newer variety, Crimson Rambler, are to my mind not suited for walls, while kinds that are not thoroughly hardy, such as that fine old Noisette, Lamarque, are, from the delicacy of their constitution, out of the question, at least, except in some very sheltered position.

Réve d'Or.—1 am always inclined to place this in the very front position as a wall-Rose; it is fuller than, and equally as bright as, the old Solfaterre: indeed, I have more than once seen it exhibited in a winning stand of Tea Roses, and in freeness of flowering it is not excelled by any Rose that I know of. It is not an altogether summer-flowering variety, for I have every year gathered some excellent blooms from it in the autumn months; but I think one feature which it has in preference to many others is

more or less free-flowering; some of them make much longer shoots than others, while all in their flowers retain more or less the character of the type. Its very long shoots prevent it from being as much clothed with foliage as one could wish, but the exquisite purity and beauty of its flowers make it very desirable, and few persons who could find room for it would grudge it a place.

Climbing Niphotos.—This heautiful Rose, sent out by Keynes, Williams & Co., is well deserving of a similar position to the preceding; it makes very long shoots, sometimes as much as 18 to 20 feet in length, and all who know the type will, where it is possible, give it a place, but, as with the preceding, it requires a warm, sunny position.

Gloire de Dijon.—This old and favourite Rose, a chance seedling of the garden of Jacquetot, at Dijon, has had a success unparalleled by any other Rose in cultivation, and cannot be left out in any list of wall Roses, although 1 think some of its progeny which now go by the name of Dijon Teas are in some respects its superior.

Belle Lyonnicise is probably one of the best of these.

Dijon Teas; it has abundant foliage of a rich glossy-green. The flowers are large, and bright in colour, not given to splitting, like Labelle Lyonnaise; it also gives a good many flowers in the autumn, and is very hardy.

the inviting Teschon.—A bright orange-yellow, shaded with fawn; a very vigorous grower, and, I think, likely to prove a valuable Rose.

Henriette de Beauran,—This is a very pretty bright yellow Rose, and there is an interest about it peculiarly its own. It is the last Rose sent out by Lacharme, one of the very best, most honest, and experienced of French Rose-growers; it is very vigorous, with abundant foliage, and worthy of the reputation of one who has given us some of our best Roses.

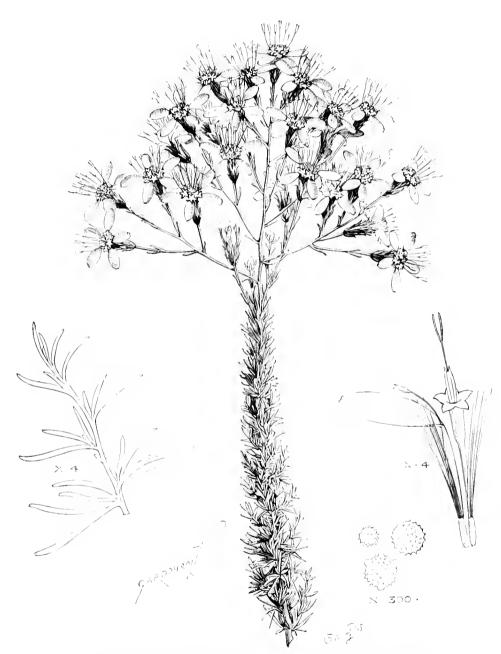

Kaiscrin Friederich. — This is a very fine Rose, closely resembling the old Gloire de Dijon, but dying off with a reddish tinge on the margin of the petals, which reminds one of the blooms of Marie Van Houtte.

Monsicur Desir.—I have not seen enough of this Rose to be able to thoroughly recommend it; it is a red variety, but I am afraid it has too much of what the raiser calls violet, which I fear implies that most objectionable colour magenta.

Fortune's Yellow, -1 would plead for a place for this very beautifully-coloured Rose, where the climate is favourable for it, for it is rather particular, and is not (especially in its young state) very free-flowering, the foliage is handsome, and the flowers remind one more of an Austrian Copper-briar than any other Rose that I know of. I do not think it is desirable for exposed situations, and were I restricted in the space I had to cover, should probably make it give way to something more dependable; the same reason which caused me to exclude W. A. Richardson from a wall applies to such become discoloured, and a flourishing plant of it on a wall appears to be covered with dead Roses, and heuce I have always regarded it as only fit for indoor cultivation. Wild Rose.

GARDEN NOTES.

PLANTS IN FLOWER .- Just now the Dimorphanthus mandhuricus is at the height of beauty. grand appearance it makes with its gigantic leaves of over I feet 6 inches, and about 3 feet wide!" Of its

TIE. 57.-APLOPAPPES ERICOIDES: COLO'R OF FLOWERS LIGHT YELLOW. (For particulars, see first part of Belgrove article, in our i-sue for Sept. 5, p. 178.)

flowers as Beauté Inconstente and Shirley Hibberd. There are also some of the Dijon family of which I know nothing, and therefore caunot conscientiously recommend them, though they may be very good. There are also some climbing sports of our hybrid perpetuals which do very well for low walls, but in these notes I have had more in my mind the walls of dwelling-houses, and places where very rampant growers will find plenty of room. It may be objected that I have left out Maréchal Niel; but I have done so advisedly, without in the least detracting from the beauty of this grand Rose. I have always maintained that it is not suitable for outdoor cultivation; the outside pctals of its pendent flowers

kind, nothing equals it, and now, with the large tufts of white bloom at the apex of each shoot, florescent "bunches" of which measure 20 inches by 18 inches combined as it is with beautiful feliage of a deep darkgreen, now somewhat changing into red and purple, all tend to make this a most desirable bush. I grow it in my Khododendron bed, among which are also Ferns, Lilies, Daffodils, &c.

The common Foxglove, Digitalis purpurea, is said to be biennial. I have grown the same plants three years, and one four years, and all of large size. One plant of Dalba, two years old, this year grew to the great height of 9 feet 4 inches, and the bloom-spike of pure white bells, was just over 5 feet 8 inches in

length. But this has been a "growing" year. I have now just about to bloom a plant of Harpalium rigidum giganteum that is over 10 feet high, and it has not yet shown the colour of its flowers. The Sweet Peas have run up to an unusual height, some being nearly 6 feet. The Ferns are wonderful.

What a valuable shrub-like plant Poligonatum compactum [officinale?] is! Just now it is very pretty, each shoot being tipped with a thin spike of white flowers. It is very useful for covering banks, which it does quickly, having a natural tendency to a spreading habit of growth-in some situations too much so. My Lilies have made a grand show this year, particularly the davuricum varieties, and also L. croceum; these I grow in patches of twenty to twenty-five, then, when in bloom, they have a gorgeous effect. L. chalcedonicum, though doing fairly well, has not been so great a success; though the double light purple Turk's-cap (Martagon) was particularly strong, as was L. album, showing very large spikes of flowers, and also L. dalmaticum. I do not think the Lily is half so much cultivated in our gardens as it should be. many kinds of great beauty being so very easily grown.

And for "a bit of blue" what can excel the new Kelway varieties of Delphinium! How chaste, and yet how rich they are in colour. I have some that are of a most delicate azure, tinted with pink, a white centre, and double-flowered; and some of a glowing deep blue, tinged with carmine, and others that are now blooming for the second time. This they will do if prevented from seeding. And at this time of year what a foil their colour is to the yellow. How fine is the glow of colour in the Phloxes, ranging, as it does, from white to almost intense crimson scarlet. And yet but few gardeners have the newer and more beautiful Delphiniums. They are beautiful; and now is the time to plant them. And do not forget to put in some Lilies. Oh! yes! and Dimorphanthus mandhuricus. Harrison Weir.

BELGROVE.

(Continued from p. 279.)

Among "Morning Glories" a note was made of a Japanese species, which is said to reach a height of 17 feet, but that great height is not going to be reached by the Belgrove plants, although every encouragement has been afforded them, including a tempting and ingenious arrangement of twine. An allied species is Convolvulus macrostegius, the flower white, with pink ribs. The remarkable Senecio Tropæolifolius was observed, but it was destitute of blossoms; and in similar condition was Pentstemon Watsoni, a Colorado species, obtained from Herbe & Wulle, of Naples. Another rare species noted was Ostrowskia magnifica, not a handsome thing, but striking in its form of flower and quaint habit of growth,

Auemone japonica, Couronne virginale, with white flowers having forty petals each; A. j. Coupe d'Argent, A. j. rubra superba, and A. j. Beauté Parfait, are one and all very desirable forms, very free in flowering, and doing almost anywhere if let alone. The bushes of Rosa rugosa, in variety, were, of course, out of bloom, but one was enabled to see how floriferous they had been by the abundance of the fruits. These, as they ripen, are gathered and made into a delicious preserve. Rubus ellipticus is peculiar from its spiny stems, which are bright red in colour.

We now leave the small garden, and survey the coutents of a narrow border with a tall hedge to the south of it. Here were Senecio compactus (see fig. 53, p. 277, in our last issue). Rhododendron Keysii, has tubular, red-coloured flowers, tlat bear resemblance to those of Mitraria coccinea; Passiflora alata x with P. corrules by the late Mr. Masters, of Canterbury, and figured as P. aluta corulea, although brought out as P. Fordii rome years later. Here were a'so Buddleia variabilis, a plant of recumbent habit, and greygreen foliage. We are in doubt as to the correctness of this name, and should be glad if any of our readers could throw any light on the origin of the plant. Several Deutzias were here remarked, chiefly M. Lemoines'

crosses; also Berberis diaphana, with almost transparent berries; Aralia panax sessilifolia, Hypericum triflorum, the largest flowered of the genus; Philadelphus Coulteri, a form of P. mexicanus, and the only Philadelphus which possesses two colours in the blooms, white, with an eye of pink. Nothospartium Carmichelie, Abutilon vitofolia, a perfecty hardy species; Senecio laxiflorus; Bambusa Castilonis, a plant with yellow variegated foliage, and the stem on alternate sides green and yellow—a pretty species; Viburnum dilatatum (Lemoine), Meliosma myriantha, and Eupaterium serrulatum, from Uruguay, were some of the more remarkable species on this border, which is a kind of probationary quarter for unknown and untried plants.

The terrace in the front of the mansion is bounded by a row of plants remarkable chiefly for nobility of habit and form of foliage. These stand at the top of the slope, each in its own small circle. We will cummerate some of the species and varieties of Kniphofias standing here, of which Mr. Gnubleton has one of the best collections in Britain. There were K. Pfitzeri, K. corallina, K. modesta, K. recurvata, and K. pracox, which sometimes does duty for the last-named; K. nobilis pallida, K. spectabilis, K. Henry Cannell. K. grandis, very rare, if true; K. Triumph, K. T. S. Ware, K. President Cleveland, the finest, it is said, of Pfitzer's raising -the flowers a kind of varnished searlet, and the llower-spike of great length; K. Hofgartner Fiesser, with red flowers; K. Nelsoni, a small dwarf-habited form, with bright scarlet flowers, and four or five flower-spikes that come in succession; K. John Waterer, and K. longicolis, which has the advantage (!) of flowering at the end of December; K. Obelisque, a beautiful yellow flowered variety; K. Sandersii, also yellow-flowered; K. Lacasis, flowers apricot coloured; K. No. 125 of Pfitzer, the brightest of all his raising; Direktor Stohl, K. Rooperi, K. Regeliana, one of the strong-growing varieties; K. comosa, which has the peculiarity of beginning to open its flowers in the middle of the spike, and going upwards and downwards; K. Canarine, and K. Kaiser Wilhelm. Others were noted, but the above will show the size and importance of the collection.

The almost new Dracena Doucetti was making a fine robust plant, being 5 feet high and 4 wide. Near by stood the yellow variegated Pampas-grass, very handsome; Miscanthus sinensis, often grown for Eulalia: Phecuix senegalensis, a splendid, healthy plant, which stood out the '95 winter, and lost its leaves; Sparaxis pulcherrima, with deep purple and pink flowers; there are two varieties, growing 6 feet high, and have purple berries succeeding the flowers. Gynerium Argenteum Lambleyi has silvery variegation, and is a desirable variety; Yucca recurva variegata and Y. gloriosa variegata do well out of-doors; Beschorneria glauca, with bright green flowers, having brilliant rose-coloured spathes, is another rare plant; Erythodena conspicua is a beennial scarlet flowered Thirthe.

On another part of this terrace, we remarked plants of Caryopteris mastacanthus, Grindelia hirsuta, a yellow Composite, with much waxy secretion on the top of the flower-buds. Lavandula atro-purpurea, with flowers individually double the size of those of the common Lavender. An Arundinaria falcata was 20 feet high, and Malus floribunda and M. Sielohdi syn. Toringa form d good sized trees. Both species flower profusely. Weigela japonica was a large plant, with white and libra coloured flowers, very free. A Wineberry Aristotelia (Tarpera) was remarked about this part of the garden.

In what was intended to be a garden of Hollies, but owing to the partial failure of these shrubs is heing filled up with plants better suited to the locality, the following species of trees and shrubs were noticed: Hammaniels Zuccariniana, Juglans allanthifolia, the tree loaded with immense clusters of nuts, the leaves measuring 2½ feet in length; Corasus Padus, var. grandillorus, the "aureus" variety of the common Yew, a nice plant of Picca Alcockiana, Cupussus macrocarpa, with effective yellow variegation; a big shrub of Choisya ternata; the rare Cotoneaster Fontanesii, the golden-leaved Castaner chrysophylla; Hey Bodginsii annea, with very fine leaf effects; L. buutolia net a bit like a Holly: Obcaria illiefolia, Span'imm a tuensis, Spinca; Fontainesia alba, and Campbelli was a good plant, which hos not bloomed

although it has done so at Fota. The owner has the hope of seeing it flower before it dies. It is a tree of 12 feet in height. Berberis bullata has fine red fruits, and Hymenanthera crassifolia, a plant whose berries are at the first of a slaty-colour and change to white. Colutea melanocalyx is a species of Bladder Senna with yellow-variegated foliage; Parrottia persica formed a fine large wide-spreading tree, the leaves of which are changing to rich colsurs; and Laburnum (Cytisus) Alschingeri is a free flowerer judging by the quantity of seed vessels hanging on its branches. Pinus pungens var. Kosteri is remarkable for its gray-green needles; Hydrangea quercifolia was growing thriftily; Daphniphyllum glauceseens was a bush 12 feet by 12 feet; Spirae bracteata, a plant figured in Botanical Magazine, t. 7429, had been covered with its wreaths of flowers; Virgillea Intea, whose buds are curiously enclosed in the basal portion of the leaf-stalks; the rare Lonicera Meersii, a plant that has not been figured in any book as yet, succeeds admirably in this part of the garden. Of climbing plants seen on the walls of the kitchen garden, we may enumerate Malva Munroi, Cladianthus Lyalli, Xanthocera sorbifolia, the lastnamed with ripe fruits, which contain within a fleshy husk a number of black seeds of the size of horsebeans.

Our list of rare and beautiful plants, collected by Mr. Gumbleton at Belgrove, is by no means an exhaustive one, and many more could be named had we space at our command; but prudence bids us halt At other seasons of the year numerous bulbous plants, and of which little or no trace remained and no note was taken, doubtless add their quota to the floral beauties of this charming garden.

FORESTRY.

THE DOUGLAS FIR.

As a good deal has been said in the columns of the tiardeners' Chronicle about the Douglas Fir, it may be of interest to some of your readers to know that a cargo of Douglas timber was landed in Devonport Dockyard in 1864 for experiment. Its strength and density were greater than that of the best Baltic red Pine used for topmasts and jbb-booms, so it was tried for those spars. It was heavier than red Pine, and was very straight in the grain and free from knots. However, a peculiarity, viz., the rings being harder than the wood between them, caused topsail yards, when lowered, to shave off long splinters from the spars. This, and the weight of the spars, prevented it from being recommended for topmasts.

In 1884, Mr. McCorquodale kindly showed me some of Lord Mansfield's plantations, near l'erth, in Scotland. The oldest plantation of Pouglas was then twenty-eight years old. The trees stood 12 feet apart, and Larches that had been planted between were gone, and light was being let into the plantation by sawing off the lower branches of the Douglas Firs. These were two fine trees on the Lyndock estate. One of them coned freely, and was surrounded by a paling, with zine plate at the top of the pales, curving outwards to prevent the squirrels from robbing the tree. About 7,000 scedlings were being raised yearly, and the young plantation 1 saw had Douglas Firs in rows 14 feet apart, with Larch between.

Douglas was used as a shade-bearing tree (I prefer shade-enduring, to express the German words schutten trap m/1 in old Oak and other woods with great success, as the Douglas Fir grew fast among the old forest trees with straight stems, in places where few other Firs would thrive.

I have seen it scattered among Larch and other Firs in Sir Thomas Acland's plantations near Porlock, in North Devon, but that mode of planting it is not a success. It grows more rapidly than its neighbours, and gets deflected by the wind and injured. H. E.

THE WEEK'S WORK.

THE ORCHID HOUSES.

B / W. H. Whife, Orchid Grower, Burford, Dorking.

LÆLIA PURPURATA.—This fine species and its varieties having fairly started into growth, each should now be examined to see if more rooting space is required. The young breaks at this season, but a few inches in height, will begin to put out roots, and these should have sufficient space to grow inside the rim of the pat, it is, therefore, necessary when repotting the plants to have pots large enough to

afford space that will suffice for two seasons. Plants in good health in pots filled with roots should have the pot broken, and as many pieces removed as possible without disturbing the old drainage materials, afterwards picking out the old soil without injuring the roots. Large specimens whose back bulbs have been lost will need to be re-made up, all decayed pseudo-bulbs and dead roots cut off, and all worn-out compost removed. Afford plenty of drainage, and over tip place a thin layer of sphagnum-moss, and above that, good fibrous peat and moss mixed together in equal quantities, mingling with these some thick crocks. In repotting Lælias, keep them raised above the rim of the pot, and to keep the plant in place, secure a pseudo-bulb here and there to neat sticks.

LÆLIA ELEGANS.—Plants of this species, as they go out of flower, push forth almost directly from the base of what was the flowering pseudo-bulb, a quantity of roots, which, if afforded some fresh potting mixture, readily seize upon it. Growth at this time being completed, the plants should be placed in a house having a temperature of 60° at night, and gradually exposed to more light and air. Too much moisture at the root should be avoided at this stage, the tender growths being very liable to decay.

CATTLEYAS.—Cattleyas gigas, Dowiana, Warnerii, and other autumn-flowering C. labiatas, having completed their growth, should be given a similar kind of treatment. The different varieties of C. Eldorado may also be repetted as they pass out of flower, and while the night temperature of the Cattleya-house remains at about 65, they may remain therein, but when cold weather sets in, and it falls to 60°, they should be removed to the East Indian-house.

COOL HOUSE ORCHIDS.—The present season is the most suitable for re-potting the inmates of the cool houses, especially Odontoglossum crispum, O. l'escatorei, O. triumphans, O. tripudians, O. Halli, O. gloriosum, O. cirrhosum, O. Harryanum, O. nævium, O. luteo-purpurcum, O. hystrix, O. cuspidatum, O. polyxanthum, O. nevadense, O. mulus, &c., and the various hybrids of O. Andersonianum and O. Ruckeri-The plants for a few days prior to the amum. repotting should be allowed to become moderately The best fibrous peat, well pulled to pieces, and all of the dust sifted out of it, freshly gathered sphagnum-noss, from which all rubbish has been removed, as well as all slugs and snails, and quantity of small crocks, form the best sort of matereals for the potting compost. If the sphagnum-moss is very wet, squeeze the water out of it, and after picking it over spread it out to dry. The peat and the sphagnum moss should be used in equal proportions, and all should be thoroughly well mixed together. The pots should be filled to three-fourths of their depth with clean crocks, over which a thiu layer of moss should be spread. Turn the plants out of their pots, should be spread. and with a pointed stick remove the decayed compost, not disturbing living roots which may be found clinging to any that is in a sound condition, unless it be quite necessary to do so; trim off dead roots, and repot m pots of a suitable size, carefully avoiding over-potting. Keep the base of each plant a little higher than the rim of the pot, and press the material firmly about the roots; afford the plants a good watering, and for a few weeks afterwards apply enough water to maintain life in the sphagnum. Moisten the pots and the stages morning and evening, and admit plenty of air, especially when the temperature is above 50°, and the hygrometer is within a few degrees of the satoration point; and shade from sunshine at all times,

THE HARDY FRUIT GARDEN.

By G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

PEACHES AND NECTARINES.—Continue to cut out the old fruiting-wood from Peach and Nectarine trees when the fruits have been cleared from them, and stop all lateral growths to one leaf. Young trees which have made stronger growth than is desirable, may be marked for being re-lifted or root-pruned next month. If any are not making proper headway, it will be well to mark these also, so that they may be lifted, and their roots examined. It may be found necessary to remove some of the old soil in such cases, and replace with a more suitable compost.

RASPSERRIES.—Antumn fruiting varieties will require to have the fruits protected from birds, which may be effected by placing fish-netting over some light laths, fixed at a sufficient height to allow of the fruit being gathered without removing the nets.

STRAWBERRIY PLANTS that were put out after being forced, especially such a variety as La Grosse Sucrée, will now be setting a considerable crop o fruit, and if the next few weeks should prove fine and warm, several dishes may be gathered from them for dessert. A little dry litter should be placed round each plant which is bearing fruit, and before the fruits begin to change colour they must be protected from birds.

GENERAL WORK .- Remove the nets from fruit trees from which the fruits have been gathered. nets should be thoroughly dried, and hung up in a dry place where mice will not harm them. Take notes of the varieties of all kinds of fruits, but especially of the newer ones, that a selection may be made, and all unsatisfactory varieties gradually weeded Only those which are the most suitable to the locality, and bear freely fruits of good quality, are de-Filberts and Cob-nuts need not be gathered until they show signs of falling. Choose a dry day for the purpose, and spread the nuts ont-of-doors for a few hours each day for about a week, when the weather is fine, to thoroughly dry them before they are packed away in jars or clean, large flower-pots. jars or pots should afterwards be placed in a cool dry cellar, easy of access. Nuts stored carefully in this way, with a sprinkling of salt on each layer of 3 or 4 inches deep, will remain in condition for a consider-

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

TRANSPLANTING EVERGREENS. - From the present time to the middle or end of October is the lest time to meve evergreen shrubs. The ground generally is then in a moist condition, and the temperature is favourable. Beyond a good watering at the roots to settle the recently-moved soil, little labour will be needed after the shrubs have been re-planted, and the soil being warm they will soon make fibrous roots, and the trees will become partly established before severe weather occurs. In lifting the trees, preserve as many roots as possible, and cut cleanly off with a knife the ends of any that may have been injured. A ball of earth in proportion to the size of the tree should also be preserved, but this may be difficult in the case of light sandy soils. However, in such soils root-action will commence sooner than in soils of a stiff nature. The ground in which the trees are to be planted should be well worked or trenched, as trees seldom thrive if placed in hard, unbroken soil. Should the ground be of sneh a nature that the soil cannot be moved to a sufficient depth, it is best to plant high, and make a mound of good soil about the base of the tree, and support with stakes until the tree is established. This is particularly necessary where there is little or no natural drainage, or the subsoil is clayey.

DOUBLE-FLOWERING BRAMBLES.—These are capital flowering plants for the wild carden and appropriate places in the shrubberies and pleasure-grounds. The blossoms are extremely pretty, and are borne in great profusion all through the late summer and early autumn months. They are valuable even when growing among other shrubs, but their gracefulness and beauty are best seen when growing naturally in the wild garden as isolated clumps or rambling over treestumps or rockwork. Rubus fruticosus, R. f. flore plena alba, and R. f. rosca are the best varieties, and are easily obtainable from nurserymen for a few pence.

GENERAL WORK.—Bulbs of Tulips, Daffodds, &c., that were saved from last season's forcing, &c., should now be examined, and all decaying or undersized bulbs rejected. The rest may be planted in the wild garden or in patches in the shrubberies; they should on no account, however, be used for planting in beds and borders in conspicuous positions, as they cannot be depended upon to bloom satisfactorily. Secure growing shoots of Dahlias to stakes, and at the same time carefully examine the plants, to correct any that are incorrectly named, and diseard others. Continue to transplant spring-flowering plants that will be needed to fill the flower-beds presently.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury,

VINES.—Frequently look over all Grapes which are ripe or ripening, and remove any shanked or decaying berries promptly. One such berry, if left for a day or two, will quickly become the centre of a mass of decay, and more especially if the bunches have been insufficiently thinned. Keep the Vine free from lateral growths, and endeavour to preserve the principal leaves green and healthy to the last. Strong young Vines from which the fruit has been cut will possibly be furnished with wood that is a little soft and pithy, and they should now be afforded sufficient fire-

heat and free ventilation, to thoroughly mature this. Do not, however, allow the roots to become dry at this or any other stage. If the border be mulched with some light dry material, it is a great help in conserving moisture. Early vineries from which will be required in April or May next should be prepared for pruning about the end of the present month by keeping them as cool as possible, to induce a complete rest in the Vines. Thoroughly cleanse the woodwork, glass, &c., and effect any repairs and painting which are needful. Ripening Grapes should be encouraged by means of a little extra fire-heat and free circulation of air to finish during this month, especially if they are required to be kept during the winter either upon the Vines or in bottles. If Vines have to be harried Lite in the autumn, they neither keep well nor will the flavour be good. Remove all lateral growths, but the principal foliage must be kept healthy as long as possible. Atmospheric moisture must be considerably reduced, especially where ripe Grapes are hanging. A rather dry mulching material should be afforded to the inside borders.

POT VINES intended for very early forcing, will now be shedding their leaves. After shortening the canes to the required length, they should be stood in a cool, shady position, so as to ensure them a complete rest, but do not allow them to become dry at the root.

FIGS. -Late crops of these are now ripening, and must be afforded sufficient artificial heat to obtain a free circulation of warm, dry air. See that enough water is supplied to the roots to keep the foliage in a fresh, healthy state, for if allowed to suffer in this respect, the fruit will be deficient in quality. Trees from which the fruit has all been gathered may be syringed two or three times weekly, so as to keep the foliage clean and fresh till it begins to fall naturally. Reduce the supply of water to the roots, but not to the extent of causing the leaves to flag. Keep a drier atmosphere, and afford free ventilation. Trees in pots required for early forcing should now be re-potted if larger pots are desirable; if not, remove a few inches of surface-soil. Cut away all small roots near the top, and top-dress with fresh fibrous-loam, a little mortarrubbish and bone-meal being incorporated with the soil. When this has been done, place the plants in a cool, airy situation.

PLANTS UNDER GLASS.

By Jno. McIntyre, Gardener, Woodside, Darlington,

CHRYSANTHEMUMS.—Owing, unfortunately, to the early nature of the season, it has been necessary to run many of the varieties on to the terminal bods, as the crown buds would have been too early for exhibitions. The plants have now almost exhausted the potting material, and those whose buds have been "taken" may be fed liberally. It is my practice to use liquid from the farm-yard and soot water alternately. Take care that all the plants are made secure against high winds. The stakes should be fastened to a rail or a strong wire running the entire length of the rows; and for the purpose of ripening the points of shoots, each shoot should be tied clear of its neighbour, so that sun and air may have access to it.

CINERARIAS, CANNAS, AND ROSES - Encourage Cinerarias to grow as rapidly as possible. The plants should be in cool pits, and the pots stood upon coalashes. Nofceding should be done until the plants have well filled the pots with roots. The late batch of Cannas is now proving very useful. Supply the plants liberally with some artificial preparation that has no disagreeable odour. Roses in pots intended for forcing early should be kept rather dry at the roots in order to get the wood well ripened. They should be pruned about the end of September, and afterwards re-potted or top-dressed as each may require. For potting use strong loam, river sand, and a sprinkling of any kind of artificial fertiliser,, and make the soil firm. Hybrid perpetuals are pre-ferable to Teas for pot-work, giving a larger return in blooms. Bouvardias planted out in pits or frames should be given a check, by cutting through the roots at about 3 or 4 inches from the stems. Ten days after this operation, the plants may be potted up and no check will be felt. When they have been potted, keep the plants well shaded until they take hold of the new soil.

CROTONS AND DRACÆNAS.—Take off the tops of Crotons that have become leggy. "Ringing" is the best system of propagating the tops of large Crotons, that is, the bark is cut round, when the tops quickly emit roots, in a moist and hot house. As soon as the first sign of rooting is observed a ball of sphagnum moss should be tied round the stem, and when the roots have pushed through this, the top may with safety be eut away and potted. Seldom are any basal leaves lost when propagated in this way. As soon as a top is potted, plunge it in bottom-heat in the propagating - frame until well established. Continue to obtain enttings or eyes of Dracemas. It is best, whenever an old plant becomes "leggy," to take the stem and cut it into pieces 2 inches long, and place them in Cocoa-nut fibre refuse.

BULBOUS PLANTS, ETC.—Established bulbs of Amaryllis (Hippeastrums) will have become sufficiently ripened to allow of their being dried-off. Pots of these may then be stored away until the end of January in a dry airy place, where they will be secure from a lower temperature than 45°. Seed lings raised this year may be kept growing for some time yet. Achimenes, Tydaes, and Gesneras now becoming unsightly also require less water, and may also be gradually dried off. When thoroughly ripened, put them away on a dry shelf, but not near to hot-water pipes, or the bulbs are apt to shrivel. Gradually dry-off all Caladinus, doing this slowly, for until the bulbs are thoroughly matured, they require a certain quantity of water.

THE KITCHEN GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead

ONIONS.—If the tops of these still remain green and erect, they should be bent down with a wooden rake to induce them to quickly mature. In many places, however, the tops have already ripened off, and where this is the case, no time should be lost in pulling them, otherwise in rainy weather they will root afresh. If the surface- soil be sufficiently dry, the bulbs may be pulled up and left on the bed in broad lines, and after turning them over a few times so as to dry them thoroughly, they should be taken without further delay to the store, where they can be further cleaned, and roped or bunched as opportunities occur. Should the weather be unsettled, lay the bulbs, when pulled, on boards, hurdles, or a hard gravel-path, and store them thinly upon the first dry day. Seeds to fuznish plauts for standing through the winter may yet be sown. Varieties of Onions, such as are usually sown in the spring, may also be sown now in drills 9 inches apart, and be transplanted to prepared quarters next spring. Unless the winter be unusually severe, these will pass through it safely, and furnish strong plants, without the inconvenience of sowing seeds in boxes in heat, and hardening off in frames before planting out in spring. Cottagers who grow Onions for exhibition sometimes adopt this plan with excellent results, and I am aware of one instance where large exhibition Onions have been thus grown this season in a gentleman's garden, the bulbs equalling those sown early in heat and grown on for planting out early in April. This method is also advisable where the Oniou-maggot is generally troublesome. The tops become so hardened that the fly cannot readily deposit its eggs.

ASPARAGUS.—The heavy rains now being experienced should not be allowed to break down the tops, but the latter should be afforded timely support from stakes and soft twine. If the planting of seed ling Asparagus was not completed in April, it should be done now without delay. Since the recent change in the weather, the young plants have commenced new growth, and if the plants be now transplanted and the growths tied to stakes, they will soon re-establish themselves. When planting permanent beds, preparations should be made as advised in a previous calendar; but where many crowns are lifted annually to be forced, and a corresponding number of one year seedlings planted, any well-manored plot will suffice. Planting may be done with a spade, putting them in in lines 18 inches apart, being careful to spread the roots out at a depth of 2 or 3 inches.

TOMATOS.—Young shoots should now be kept closely pinched out, and very large leaves, especially where they overlap any of the fruits, may be partly ent away, but this should not be done to excess. In the case of those growing against walls, any framolights not in use should be secured to the wall perpendicularly to keep off rain and hasten the ripening of the fruits.

FRENCH BEANS that were sown in cold pits should now be covered at night, and the lights may be kept on during excessively wet days. Where a succession through the winter is required, seeds should now be sown in 7 inch pots, filled rather more than three parts full with some moderately-rich soil.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK -57 8°.

THE author in this little work The trange and devoted to the culture of the Orange and allied fruits, states that in Algeria, Spain, Italy, and other places round the Mediterranean there are annually produced about 53,000,000 of kilograms of Oranges alone, In Algeria, the difficulty is about irrigation. The early Oranges, although still sour, fetch a good price in the markets. Many of the Old World good varieties have been introduced into California,

Corsica is the great field of production of the Citron-tree, the fruit of which is so largely used in confectionery. The author states that the demand for candied Citron exceeds the supply, so that there is room for extending its cultivation.

The supply of Oranges increases, but populations increase also, so that prices are maintained. In Paris they have held the same level for fifty years.

The cultivation of these trees yields profit, not only from their fruit, but also from their leaves and flowers, for the table, perfumery, confectionery, and acid drinks. In France, "orangeade" is as common as "limonade;" but in England no one asks for an Orangesquash. The author gives a recipe for making Orange wine, by fermentation of the juice, which seems interesting.

He gives some good hints about Orangehouses, with double-glazing for winter. He has never found that the seeds of sweet Oranges

produced the bitter Oranges, so that the solitary case quoted by McFADGEN might well have resulted from some mistake.

The author gives, from his own experience, rules for the cultivation of these most useful fruit-trees. In the last part of this manual he names the insects which are injurious to these trees, and also the fungi that attack them; but this has been exhaustively treated by M. Penzig in his Studj sugli Agrumi.

The classification of Oranges, Lemons, and Citrons seems a hopeless task; it is a chaos which cannot now be unrayelled, any more than the chaos which Roses, Begonias, &c., have fallen into, and into which the Orchids will soon fall. Insects had blended up the species and varieties of the Citrus, and created new ones, and now the whole is an inextricable mixture! The author gives a large number of wellexecuted illustrations, principally taken from RISSO and POITEAU'S work; but only a small proportion of these has come into commercial use.

The history of the Citrus and of its introduction into Europe is not satisfactorily given. The author does not seem to have been acquainted with the Flora of Amboyna of Rum-THIUS, in which, 200 years ago, were described all the varieties of the Citrns he found in the Malay Archipelago. The very words "Lenion" and "Lime" come from the Malay generic name for the species of Citrus. M. DE NOTER does not seem aware of a pamphlet, in French, by Mr. M. V. Lorer, Paris, 1891, entitled "Le Cedratier dans l'Antiquité," which clearly shows that the ancient Egyptians were acquainted with the Lemon-tree, and with Lemons. Nor does the author appear to have seen the exhaustive monograph of all the varieties of Citrus, and the learned and suggestive dissertations concerning them published in Dr. Bonavia's work on the cultivated Oranges and Lemons of India and Ceylon, which would have furnished him with a perfect mine of information on the history, botanical characteristics, commercial importance, and culture of these trees.

No one seems to have yet discovered the origin of the word "Pampelmousse," transformed by the English into either "Pommelous" or "Pommeluose." Many of the species of Citrus in general cultivation appear to have come from Southern China by way of the Malay Archipelago, India, the Persian Gulf, Syria, and the Mediterranean. The Portuguese may have then introduced others by way of the Cape of Good Hope.

Then the early Genoese horticulturists on tho Riviera raised a large number of varieties from seed. They were much thought of in those days as ornamental trees, but few of them have come into commercial cultivation.

The best Orange that now reaches the London market is the Navel Orange of California, without seeds; it has a dense skin, which enables it to travel long distances without damage.

Upon the whole M. RAPHAEL DE NOTER has produced an interesting manual which fills a want; for since the publication of the works of RISSO and POITEAU in French, and of GALLESIO in Latin, no practical manual on the Citrus cultivation has appeared. We might note that the author, on p. 19, falls into the same error as PLINY, who seems to have confounded the "Cedar" wood of Mount Atlas with that of the Citronnier, Cedrus and Citrus being similar.

We would recommend to the notice of the author the thin-skinned Pummelow of Bombay, called "Chakotra," with a beef-red pulp and a fine flavour; also the loose-skinned Suntara-Orange of Magpur, which on occasions has found its way into the London markets, but the fine Bombay Pommelow does not appear to be known to Europeau horticulturists.

Thus, if the French horticulturists, who are possessed of inexhaustible patience, would only take up the Citrus trifoliata, which is the hardiest of all, and try to improve its fruit hy hybridisation with the fine kinds in cultivation, they might succeed in evolving a hardy, useful Orange-tree which would resist more northerly climates in the open air. There is no doubt whatever that the Citrus fruits are not only of value as edible fruits, but also of great value in various diseases, such as ague, enlarged spleen, cachexia, &c.

Packers and exporters of Oranges should note that it has been discovered that Onions kept in Orange warehouses, and with Oranges in the holds of ships, impart a distinct Oniony flayour to Blood Oranges.

DRACÆNA HOOKERIANA LATIFOLIA (Regel) .--The illustration (see fig. 58, p. 305), portrays a plant which is somewhat rare in gardens, but which is destined to become popular when better known. As isolated examples in large conservatories, or for filling large vases in the dwelling, it is an admirable subject. The plant is capable of resisting a degree of cold that would be fatal to other Dracenas, and suffers less from gas-lighting, and in this respect forms a good companion plant to the well-known Aspidistra lurida. As evidence of the capabilities of the plant in this respect, it may be mentioned that a pair of theso Dracienas occupied for many weeks a position in the mansion without suffering in the slightest degree. Its growth is slow, and culture easy, requiring only the temperature of a warm greenhouse to grow it to perfection, and it succeeds best in comparatively smallsized flower pots. Several handsome examples of this plant are to be found in Mr. H. O'HAGAN'S garden, River Home, llampton Court; and one of these plants was exhibited at a meeting of the Royal Horticultural Society last November, when it received a First-class Certificate. The following are the dimensions of the largest plant; height, 33 feet; width, 13 feet; length of leaf, 23 feet; and width of leaf, 11 inches. The specimen figured possessed forty-three leaves, and was growing in an 8-inch pot. The leaves are of a dark glossy green, in form slightly undulate, asuminate, and faintly, yet distinctly, margined with ereamy white. Dracena Hookeriana latifolia is a native of South Africa.

THE GARDENERS' ROYAL BENEVOLENT INSTI-TUTION. -- A correspondent writes: "With reference to your report in a recent issue of the stall arranged at the Exeter Flower Show, for the sale of flowers and fruit on behalf of that most deserving of charities, the Gardeners' Royal Benevolent Institution, I am glad to learn that the proceeds, amounting to £16, have been handed over to the Devon Auxiliary, and will prove a substantial addition to its funds. The highest praise is due to Mrs. BRYCE, of Bystock, and to the ladies who acted with her, for their devoted services in connection with this commendable effort to augment the funds of a widely known and oldestablished institution, and I feel sure its executive will not be slow to appreciate such labours of love, nor will it forget its indebtedness to the local secretaries, Messrs. W. MACKAY and A. HOPE, whose energetic and invaluable assistance went far to ensure the success attained. My object in drawing attention to this matter is a desire to excite interest and a spirit of emulation in so worthy a cause amongst gardeners and others in different localities where shows are held. Why should not the result achieved at Exeter be repeated elsewhere, and the sum raised by such means be equalled or doubled at other places? Here is a field of work for those who have the well-being of the institution at heart, but who oftentimes feel a diffidence in soliciting help for it in

The Orange and its Culture. Les Orangers, Citronniers, Cedratiers, et autres Aurantiacées a fruits comestibles, leur Continue dans I region Mediteraneanne et dans le nord. Par RAPHAEL DE NOIFF, Paris. OCIANE DOIN.

other ways. That its need of additional aid is very real is apparent from the list of applicants, which will probably grow larger, who are appealing for assistance, which perforce cannot be vouchsafed to them, as it would were more funds available."

— We learn that through the kindness of Sir GREVILLE SMYTH, Bart., and Mr. FRANCIS TAGGART, who threw open to the public their respective gardens and grounds at Ashton Court and Old Sneed Park a few days ago, a sum of £20 has been added to the

YORKSHIRE NATURALISTS' UNION. — The Fungus Foray of the York-hire Naturalists' Union, which now seems to take the place of the Woolhope Foray, as the annual event of the kind for England, is fixed this year for the 19th, 20th, 21st, and 22nd of September, the principal day being on the 21st. The head-quarters will be at Selby, from which excursions will be made each day to the woods in the neighbour-hood, both in the West and East Ridings, followed by a gathering each evening to compare notes. On

to fungi that may be sent. Mr. A. CLARKE will exhibit a number of stereoscopic photographs of fungi. The fungi collected will be on view, and several microscopes will be available. The presence of mycologists from other parts of the country will be very heartily welcomed; and copies of the circular will be posted to any who apply to Mr. W. Denison Roebuck, F.L.S., honorary secretary of the Yorkshire Naturalists' Union, to Mr. Charles Crossland, 4, Coleridge Street, Halifax, honorary secretary to

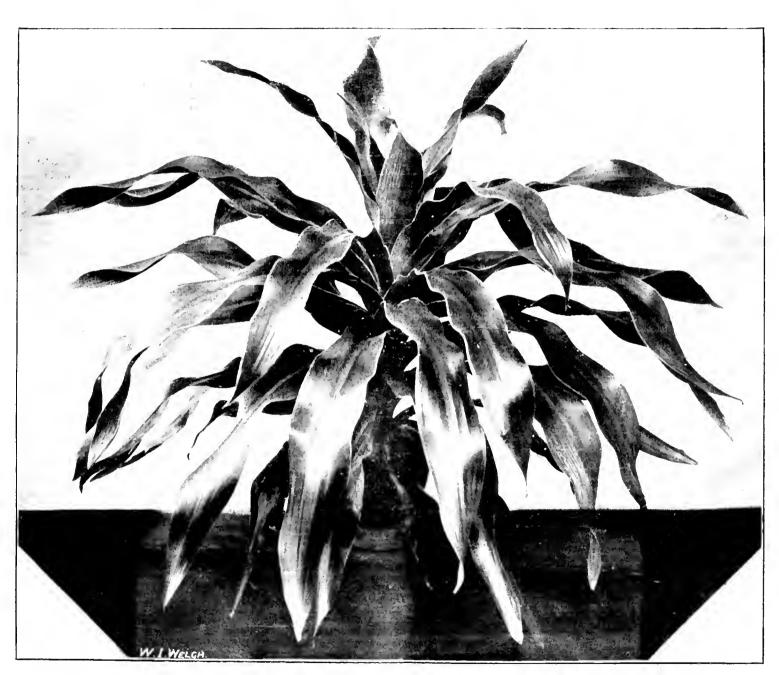

Fig. 58. - Dracena hookeriana var. Latifolia 18 6000 V in the garden of H. Chagan, 180. See p. 504.

funds of the Bristol and Bath Auxiliary of this institution. The local auxiliary was formed in 1893 in order to promote a knowledge of the work in the neighbourhood, and depends largely upon collections and subscriptions for funds. The collections at the various flower-shows this year have been fairly successful, but the number of the pensions granted by the institution need to be greatly increased, and for this purpose Mr. J. H. Vallance, the hon, local secretary, is anxious for increased support from Bristol and Bath.

Monday evening a conference will be held, at which the following papers will be read:—By Rev. Canon Du Port, M.A., on "A Case of Poisoning from eating Amonita pantherina at Charlevillo (Ardennes)." By Gro. Massee, F.L.S., F.R.M.S., on "Some Doubtful Species of Agaricus." By Caralton Rea, M.A., on "The Duration of the Sporophore of Collybia tuberosa and Cyathus striatus." By Harold Wagle, F.L.S., on "The Sexuality of the Agaricines." An oxy-hydrogen lantern will be provided for the illustration of the papers, and for showing any slides relating

the Yorkshire Mycological Committee, or to Mr. W. Norwood Chersman, The Crescent, Selby, who is acting as special honorary secretary for this meeting.

FRENCH HORTICULTURAL SOCIETY OF LONDON.—On Saturday evening, Sept. 5, at the society's meeting-place. Old Compton Street, Soho, a special meeting of the members was held, for the purpose of presenting to their president, Mr. Geo. Schneider, with a testimonial on the occasion of his

appointment by the French Government as Chevalier of the Mérite Agricole. The committee of the society invited Mr. HARMAN PAYNE to take the chair and make the presentation. There was a large attendance, and the proceedings excited the keenest interest among those present, inasmuch as Mr. Schneider was kept in ignorance of the object of the gathering. In the course of his remarks Mr. PAYNE alluded to the reception that Mr. Schneider had met with on the occasion of his recent visit to Paris, where a banquet had been organised in his honour, and a testimonial presented to him through the means of the Paris committee of the society. The chairman then explained that the London committee of the society were equally desirous of showing their high appreciation of their President's valuable services, not only as regards their own personal welfare, but also in the very successful manner in which he had directed the affairs of the Society. It was not his intention to discourse upon all the merits of their President, which were well known; and after a few other remarks, Mr. Payne baoded to Mr. Schneider a very fine china dessert-service, beautifully painted, and bearing upon each piece an inscription suitable to the occasion. Mr. Schneider, in rising to return thauks, said it was so unexpected a surprise, that he could not find words sufficient to thank the members for their kindness. He could, however, assure them that he valued their present very much, the more so because it was a useful one, and one of which he had long been in want. The meeting terminated after doing justice to "un petit punch," and some songs and recitations by tho

"BOTANICAL MAGAZINE."—The issue for the month of September contains figures of the following plants:—

Chanemorpha macrophylla, G. Don, t. 7492.—A common and withal handsome climbing shrub of Indian tropical forests, and extending from Kinnoaon along the entire range of the Himalaya eastward, and southward to Ceylon, Sumatra, and Java. Leaves large, up to 10 inches long and broad, obovate, beneath pubescent, petiole terete. Flowers in subterminal, short-peduncled cymes; calyx 3-inch long, tubular, terote, unequally shortly five-lobed; corolla white, tube hairy within, stamens inserted at mouth of the tube.

Dendrohium Leonis, Sw.—Stein tufted with fibrous roots branching from the base; leaves about 1 inch long, ovate-obloug, obtuse, distichously imbricating; flowers solitary, §-inch long, and nearly as broad, of a dirty-yellow colour streaked with dull purple. Lateral sepals larger than the rest of the flower, broadly ovate, obtuse, connate, with the foot of the column in a rounded mentuon. Petals as large as the dorsal sepal. Anther hemispheric, crown two-lobed. Native of Malaya, Java, &c.

Banhinia tadpini, Iann. A half-climbing shrub, growing from 5 to 10 feet high. Leaves petiolate, I to 3 inches long, orbicular, or transversely broadly oblong, two-lobed and seven-nerved, base round or truncate. Racemes, leaf opposed on short lateral shoots, six to teu-flowered; peduncle short, and rachis, pedicels and calyx rusty puberulous; bracts ½ to ½-inch, fugacious. Calyx-tube { to ¾-inch long, cylindric, limb about as long as the tube. Petals I to 1½-inch long, crimson or searlet, claw as long as the orbicular enspidate limb. Stamens three, fertile; authers yellow, linear-olding. From Dorn Spruit Spelunken under tropic of Capricorn, and vaciou places in the Transvaal, also in the Makua country, Mozambique.

Rhododendron Smirnori, Linn.—A small robust tree, 15 to 20 feet high, with stout branches, which, when young, are clothed with a grey felted wool. Leaves 3 to 5 inches long by 1 to 1½ inch broad, narrowed into a stout petiole, elliptic-oblong, subacute, thickly coriaccous; dark green on upper side, with a yellowish midrib; nerves six to eight pairs. Flowers in a compact, sessile head, 6 inches in diameter; culyx five lobed.—Corolla found shaped and to seried; lobes rounded and dark rose coloured margin—Country south of the Caucasus.

Celmisia Munroi, Cass.—This is one of the handsomest of the genus which represents in New Zealand the Asters of other parts of the world. The entire plant, with the exception of the upper surface of the leaves and florets, is covered with a snow-white cottony adpressed wool. Stem short, and thick as the thumb. Leaves sessile, 3 to 8 inches long, by $\frac{1}{3}$ to $1\frac{1}{2}$ inch broad. Ray flowers numerous, in two to three series, white; disc flowers golden-yellow, very many, tube five-cleft.

STIRLING HORTICULTURAL SOCIETY.— This society held its annual exhibition on the 3rd and 4th inst. in the Albert Hall, and was opened by W. H. Doble, Esq., of Dollarbeg. The display of fruit, cut flowers, plants, and vegetables, was fully equal to that of 1895 in numbers and quality. Some competent critics observed that for quality Stirling carried the palmagainst the western city. The competition over all was keen. The following were among the principal prize-takers:—Messrs. Thomas Lunt, Keir; J. Carmichael, Touch; W. Rutherford, Airthrey Castle; and J. Waldie, Dollarbeg.

BELGIAN HORTICULTURAL SOCIETY.—The monthly meeting of the Society took place on Sunday, the 6th iost., in the Casino, Ghent. The following awards were made. First-class Certificates: to Pteris beaurita argentea, shown by M. Pynaery-Van Geert; Alocasia Lewisiana and A. Gandavense (unanimously), shown by M. De Smet-Duvivier; Epidendrum prismatocarpum and Ledio-Cattleya Proscrpine, shown by M. Jules flye; Adiantum Schneideri, shown by M. A. Van der Heede; and a double-flowered seedling Cactus Dahlia, shown by M. Duriez Brothers, Awards of Merit were made to Begonia Madame Camille Claeys, shown by M. Camille Claeys; to Fuchsia fulgens, shown by M. Untendame; and to Dracema Eckhautei, shown by M. L. Eckhaute.

FIFTY YEARS AT THE ROYAL NURSERY. SLOUGH .- Mr. John Ball, who for so many years past has had charge of the Auriculas, Pinks, Carnations, &c., at the Royal Nursery, Slough, recently completed a half-century of employment, and advantage was taken of the occasion to present him, by Messrs. H. & E. Turner, with a landsome clock, and two vases to match. The clock bore this inscription ; "To Mr. JOHN BALL, on the jubilee of his connection with CHARLES TURNER & Sons, at the Royal Nurseries, Slough, August, 1896." A card accompaniel the gift, which came as a great surprise to the recipient, and on this were the words ." With the remembrance of CHARLES TURNER, and the good wishes of Harry and Arthur Turner." Mr. Ball is still a very active and confidential employe in the service of the well-known Slough firm.

MR. CHARLES WAKELY has been appointed Staff Instructor in Horticulture under the Technical Instruction Committee of the Essex County Council. He was for five years in the employ of the Royal Gardens, Kew.

MR. ROBERT DERRY, formerly in the employ of the Royal Gardens, Kew, and late Assistant Superintendent of the Gardens and Forest Department, Malacca, a post recently abolished, has been appointed Superintendent of Gardens, Perak.

MADAGASCAN PLANTS.—Rather more than two years ago, Dr. Forsyth-Major, a Paleontologist of distinction, went to Madagasear, mainly with the view to making a thorough examination of the flora and fauna, fossil, and also of, at least, a portion of the island. In difficult circumstances, owing to the unsettled condition of the country, Dr. Forsyth-Major was enabled to carry ont some solid scientific work. In July last, he returned home, bringing, besides large collections of fauna, a very fine collection of specimens of the flora of the island, including four new species of Orchids. The collections have been deposited in the Natural History Museum, where they will undergo investigation at the hands of the staff.

THE ROSE IN AMERICA.—The variety Belle Siebrecht is obtaining favour with the Americans, although at first they were disappointed with it. It

is likely to be much cultivated as a standard plant. Mrs. Pierpont Morgan is not so much thought of, although it is a variety which did very well with its raiser. There is much talk about President Carnot, which will be offered in very large quantities next year, It appears to be an admirable Roso, and one that every one must possess. Mosella is another variety which every grower will endeavour to obtain, and which will be grown extensively as a pot Rose and for planting out. It is one of LAMBERT & REITER's introductions. The new American Roses, Princess Bonuie and Pink Soupert, appear to please the public; they are good bloomers, but in colour not new. They may make good bedders.

EDINBURGH ROYAL BOTANICAL SOCIETY.— Under the heading "Grants for Agricultural Education," we note that out of the funds entrusted to the Board of Agriculture during the financial year ending March 31 last, sums amounting to £7,850 have been distributed in grants to eighteen institutions. The Edinburgh Royal Botanical Society benefited to the manificent sum of £150 in aid of instruction to working gardeners and foresters.

"The Japanese Botanical Magazine."— This organ of the Tôkio Botanical Society for July contains articles on the Smuts of Japanese Cereals (continued); on Englena viridis; Mr. H. Kuroiwa's Collection of Liukin Plants (continued); Plants employed in Medicine in the Japanese Pharmacopocia (continued); and Descriptions of some new Japanese species of Exobasidium.

ACREAGE OF HOPS.—In the "Agricultural Returns of Great Britain, 1896," appears a preliminary statement, compiled by the Board of Agriculture, from the returns collected on June 4, 1896, which shows the acreage under Hops in each county of England in which Hops were grown, with a comparative statement for the years 1895, 1891, and 1893:—

Counties.	1896.		1894.	1893.
	Acres.	Acres.	Acres,	Acres,
Berks	 4		11	11
Gloncestor	 49	38	39	33
Hants	2,494	2,875	2,911	2,795
Hereford	6,595	7,553	7,525	7,679
Kent	33,310	35,018	35,520	34,815
8.dop	140 -	150	140	123
Suffolk	7	10	17	21
Surrey	1,623	1,783	1,935	1,845
Sussex	5,927	7,489	7,589	7,326
Worrester	3,800	4,024	3,848	3,516
Tot-il	54,249	58,940	59,535	57,564

HISTORY OF THE FRENCH BEAN. - lu a paper on the "History of the French Bean," contributed by M. GEORGES GIBAULT to the Journal de la Société Nationale d'Horticulture de France for July, the following resume is given:-1st. The French Bean (Phaseolus), one of the oldest of vegetables, was cultivated in Asia Minor in prehistoric times. It is eertain that it existed in Europe in the Middle Ages, consequently before the discovery of America. The hypothesis of the American origin of this vegetable must therefore be abundoned. 2nd. The French Bean was not known in kitchen gardening until the middle of the seventeenth century. Owing to prejudices, or other unknown causes, until this period it was considered to be a very mediocre vegetable. 3rd, It was iu 1651, as is stated in a popular book on gardening, that the first use occurs of the modern name Haricot, given to Phaseolus vulgaris, which before bore different uames. 4. It is probable, if not certain, that the origin of this latter name should be attributed, by transposition of the name, to the old kitchen expression, "haricot,"

ROSE, YELLOW RAMBLER, OR AGLAIA. - Few yellow Roses, with the exception of the Austrian Briar, says Mechans' Monthly, are hardy, but this variety of LAMBERT & REITLE's raising is said to

withstand a continued temperature of 2° below Zero Fahrenheit without protection. It is a seedling of the Japanese R. polyantha crossed with the pollen of Rève d'Or. The flowers are nearly full, of a cupped shape, and of a decided golden-yellow colour. It should not be confounded with Allister's Stella Gray.

STOCK-TAKING: AUGUST.—The Board of Trade Returns for the past month show as to imports, a fall in values—articles of food duty free and dutiable showing a falling off. In 1895 the imports were valued at £34,587,396—the value for last month being £32,472,622, or a value decrease of £2,114 774—the "made elsewhere" item showing a reduction. Our anti-English friends are welcome to the figures, and to look for them in the Returns for August, just published, from which we make our usual excerpt from the "summary" table as follows:—

	1895.	T 1896.	Difference.	
Total value .	£ 01,587,396	£ 32,472,622	=2,111,771	
(A) Articles of food and drink — daty free	13,511,561	11,087,577	-1,426,787	
(B.) Articles of food and drink dutiable	2,306,484	1,920,668	=38 4816	
Raw materials for textile manufac- tures	2,834,508	2,165,714	-368,791	
Raw materials for sundry industries and manufactures	5,056,281	5,036,981	=19,297	
(A) Miscellaneous articles	1,215,758	1,043,185	= 202,170	
(B.) Parcel Post	73,130	54,771	-18,356	
		•	4.	

We may observe a falling off in Wheat from the East and elsewhere, and in materials for textile fabrice; these fallings off will correct themselves shortly. In the matter of sugar imports, it is worthy of note that our West Indian fellow-subjects are waking up to the value of modern appliances in competing with producers who are subsidised by the State-folk intent upon supplying us with cheap sugar. Some extraordinary figures are to be found in our usual extracts from the Returns connected with the importations of fruits, roots, and vegetables, as follows:—

Import	s.	1895.	1500.	Difference.
Fruits, raw :		_		
Apples .	bush	192,520	208,335	+15,845
Cherries	**	2,128	5,675	+ 3,547
Plums .	+1	157,689	340,541	+150,452
Pears		195,552	215,392	+19,840
Grapes	** **	151,486	254,361	+103,475
Unenumerate	l ,,	224,368	332,452	+105,081
Omons .	3.9	534,712	497.846	6,866
Potatos	ewt	97,414	51,094	-46,221
Vegetables, ray		£170,860	£137,931	€12,939

The masses are certainly reaping the fruits of these imports, "from Maidenkirk to John o'Groat." The plus (+) figures in the table above given, receive point in nearly every London street; and the "informal markets" of the metropolis are in many cases littered over with foreign fruits of all sorts, in many instances of very good quality. It may be noted that the imports for the past eight mooths exceeded those of the same period last year by £9,936,055. Turning now to the

Expobts for August,

we find a slight decrease, as compared with August, 1895, amounting to £179,929, the reasons for which are readily apparent as to need no explanation here. The increase in the eight months is represented by £13,480,576 - not bad, as things go. Our Russian friends interested in horticulture and agriculture are getting to be tired of the turiff which prohibits the introduction of all kinds of machinery useful in the profitable carrying on of these industries. The dues are supposed to be for the benefit of Russian industry, but the home manufacture is carried on by foreigners with capital, not Russians, and it is contended that

the abolition of protection would be a benefit to the entire community. A petition to the CZAR set this forth at length, and we may hope to find our own machine-makers shortly restored to the position they once enjoyed in the Russian markets. Whilst noticing foreign markets, it may not be out of place to draw the attention of manufacturers at home to the necessity of sending out linguists to foreign markets—men understanding the language of the people whose wants they wish to supply, men who will study the requirements of their customers, even to supplying them with a price-current printed in the language, and with the weights and measures of the folk whose trade they desire to secure; they do not do so at present.

MARRIAGE OF MR. JAMES KELWAY. — The marriage of Mr. J. Kelway, son of Mr. W. Kelway, nurseryman, Langport, Somerset, with Miss Ella Christine Stubes, only diaghter of the Rev. J. Stubes, vicar of Huish Episcopi, Somersetshire, was solemnised at St. Mary's Church, Huish, on the 3rd inst.

RUSSIAN NATURALISTS, ETC.—Kief has been selected as the place of meeting of the tenth Conference of Russian naturalists and physicians. The Conference will last from August 21 to August 30, 1897. A grant of over £400 has been contributed by the University of St. Vladimar in Kief towards the expenses.

denat, t. denat.
O. erispum var. Ashworthiasen, Lindenat, t. denat.

HOME CORRESPONDENCE.

MELON ANTHONY'S FAVOURITE.—This pretty-looking variety was raised by Mr. M. Empson, gardener to the Hon. Mrs. Wingfield, Ampthill House, Beds, and is a cross between the Hero of Lockinge and Sutton's Masterpiece. It is scarlet-fleshed, rich in flavour, and ripens to the rind. Fruits were presented so late as October 29 of last year to the Royal Horticultural Society's Fruit Committee, when an Award of Merit was granted. The variety was again shown to the committee on July 9 last, when it was awarded a First-class Certificate. That was an unusual honour for a Melon, and shows its constant character. Anthony's Favourite is a free setter, and does equally well in hotbed-frames or houses. D.

HECKFIELD PLACE. - Through the exceeding kindness of Mr. McHattie, of Strathfieldsaye, 1 was very recently enabled, after several years' absence, once more to revisit that beautiful place, lleckfield, and see, even now, how the soul of the late W. Wildsmith still lingers, as it were, and even directs the progress that is here found. Mr. A. Maxim, who now that the estate has passed into the hands of Colonel Walpole, maintaining not merely the old style, but the old form in a marked degree. Of real change there seems to have been very little, but there does seem to be as much of excellence and of beauty throughout each department as ever. The terracegardens are still very lovely, so also is the well-known broad walk in the kitchen-gardens, lined on either side by a fine Cupressus Lawsoniana hedge, which is now, as heretofore, faced by Dahlias in variety. The Pinuses in the pleasure grounds have grown into noble specimens, though none is unduly crowded; but the same old and fine expanses of undulating lawn still exists. In the houses, fruit seems to be as well dono as ever. The Early Hamburgh house, where formerly Mr. Wildsmith always found so much difficulty in retaining colour, now is on its good behaviour. The roots of the Vines have been lifted, and the Grapes, now really a fine crop, are as black as can be desired. Gros Colmar, Appley Towers, and Ahwick Seedling now occupy one side of the old Lady Downes' span vinery, and there are some fine bunches of these varieties hanging. Peaches, Nectarines, and Apricots, all have been fine crops, or are so yet; and Poars, even on the arched cordons over walks—a very charming way of growing them, not often seen—are excellent also. Vegetable growing is of the best, and the place is very neat. It was to me specially pleasant to find that these beautiful gardens, o long famons for their excellence, were so admirably kept. It. D.

OUTDOOR PEACH CULTURE. Although there are myriads of examples of good Peach culture outdoors on walls to be found in the kingdom, yet have I nowhere seen a more perfect one since the best days of the Peach-wall at Ditton Park, Slough, than was shown me in a garden of moderate dimensions, that of Park Corner, the residence of Mrs. Martineau, Heckfield, just recently. The wall, which, of course, faces south, is 100 feet long, and 9 feet in height. Throughout it is entirely covered with wood and leafage, and strong growth, too, so that every year large crops are taken from the trees. The gardener, Mr. Wells, is entitled to all praise for the excellence of his training and culture, for it is evident that only lack of wall-space prevents him from having a Peachwall double or treble the length, and as good throughout. The soil is a light black loam on gravel, very porous, and needing plenty of water and mulching. The remarkable way in which, with only moderate supplies of rather hard water the intensely dry season with all its troubles of soil and atmospheric drought, has been surmounted, reflects high credit. Lord Napier, the first tree, is the only Nectarine. Then comes Sea Eagle, Royal George, an older and noble tree, 25 feet long; Alexander, Crimson Galande, and Violet Hative. The Royal George was planted many years since, the rest just fourteen years ago. The border is about 8 feet wide, and is not heavily cropped, whilst manurial mulchings are given to the trees 2 or 3 feet in width. There is not a spider-affected leaf to be seen, and the fruits left were not only very fine, colouring up well, but they were luscious and of the finest flavour. Thus it is evident that grand crops of Peaches may still be obtained outdoors in Old England.

RUNNER BEANS.—It is surprising to learn, as I did from an estimable Scotch gardener the other day, that Scarlet Runner Beans are yet held in low repute in Scotland, and in many parts are hardly regarded as a desirable vegetable. That may be to some extent due to prejudice, but largely also, no doubt, to the fact that green Peas may be had over a very long season in the North. Here, southwards, we regard the Runner Bean so highly that good samples constitute a strong point in collections of vegetables, and gardeners who have to supply private establishments find them to be of great value. However, that is all old history. But the remarkable improvements effected during the past fifteen years have been great, and now Scarlet Runners are singularly perfect. The long, green, narrow Ne Plus Ultra type has quite superseded not only the old short-podded forms, but also the giant broad podded section, and now the earlier forms of Ne Plus Ultra are being superseded by finer selections. Raiely have finer or handsomer pods

been seen than were presented at the Co-operative show at the Crystal Palace this year. Still, too many of the samples were too large, too long, and even old, for cooking. The very best selection I have seen, so wonderfully true in relation to every pod, large or small, not as seen in competitive dishes, but growing on the plants, is Sutton's Best of All. Probably it is a name that is merited, as it seems difficult to improve the stock. The young pods, when from 6 to 7 inches long, hanging, as I saw them the other day, on a long line at Maiden Erlegh, and every one alike, form, in my estimation, the most desirable Beans for consumption. We allow our Runner Beans to hang too long, to become too large, then slice them up so that when cooked they are unrecognisable; whereas they should be gathered much younger, and after being strung if needed, should be cooked whole. Certainly the newer types have denser flesh than the older and more generally discarded varieties. Vegetarian.

FLOWER-POT DRAINERS. - This is a patent article, and consists of an earthenware colander for placing at the bottoms of flower-pots, and it is claimed for it that it is clean, convenient, simple, economical, and durable. The idea is not a new one. There is an improvement upon this, in which the drainer, being made of non-corrosive aluminium, is practically indestructible. The drainer is of sufficient depth to supply the necessary outlet for the water, being perforated with small holes of a size which will prevent the ingress of worms. Those amateurs who have at times but little leisure for potting plants, and know the labour of breaking up crocks for drainage, would find in the new drainer saving of labour, as all that is required is to cover the hole with the drainer, over which a little moss or Cocoa-nut fibre may be placed. The presence of worms in the soil in which potted plants are grown is a source of annoyance at times, and the drainer prevents them getting into the soil from the outside. R. D.

tPOMŒA VERSICOLOR.—This is employed by Mr. E. Beckett at Aldenham House, Elstree, with excellent effect. He has it trained to poles in his mixed beds, but secures the best effects by having it on the cool northerly side of his cottage planted against the wall, where it twines itself about strings suspended for the purpose. It is blooming freely, forming numerous racenies of crimson flowers edged with gold, and deepening to orange. A native of Mexico, it was at one time much grown, but has now fallen greatly into neglect, and yet, as employed by Mr. Beckett, it is very showy, continuing for a long time in bloom. It can be readily raised from seeds in spring, helped by a gentle warmth, and when sufficiently hardened off, and the weather is favourable, it can be planted out where it is to flower. R.

A VARIEGATED-LEAVED HONESTY.—This form is by no means new, but Mr. Beekett has some examples in the gardens of Aldenham House very handsomely variegated with creamy-yellow; and associated with darker purple-coloured flowers than is usually seen. Large and well-grown specimens dotted about the hardy flower borders are very effective, and challenges notice by the force of the contrast of foliage and flowers. It appears to come true from seed, but in order to fix a good type, it should be grown quite apart from the green-leaved form. The Honesty is a very showy free blooming plant, R.

THE ABUNDANCE OF FIELD MUSHROOMS.—
The recent rains, after the severe drought, have, in this district, been productive of what I consider a phenomenal crop of Mushrooms—the pastures are almost covered with the fungus. As a point in fact, I know of over 3 bushels being gathered from a field of less than 5 acres area in one morning, and only the large ones taken, the small ones and "buttons" being left. This last week they have been almost unsaleable in the local markets, the excessive quantity causing them to be quoted as low as 3 lb. for one penny. One feature noticeable in the fungus itself this year is the colour of the skin, which is white as snow. F. Tugwood, Leighton Gardons, Iron Bridge.

THE STREPTOCARPUS AS A SPECIMEN PLANT. We are accustomed to see at exhibitions collections of improved forms of the Streptocarpus as ficely-bloomed small plants, and in this way they are very effective; but it can also be grown into fine and imposing specimens, as could have been seen at Alderlium House, Elstree, where Mr. E. Beckett had a number of very fine examples growing in large

flower-pots, which bloomed most abundantly. I do not know whether the remarkable size, stoutness, and symmetry of the blossems were due to the particular strain, or to culture alone, the latter probably having most influence. Such plants are real specimens, and some of the blossoms almost rival, in size, those of the pendent Gloxinias. The plants were two and three years old. I was much pleased with a white variety with bold black pencilling on the lower segments; and also one having blossoms of a crimson-puce colour, which seemed both new and distinct. R.

MAIZE, OR INDIAN CORN-I had often seen Maize growing in England as an ornament, but some years ago, when I went to live in Canada, I saw it growing in almost every garden, and heaps of the culms in the market, besides what the farmers grew for their eattle, pigs, and fowls, and everybody delighted when the corn was ready for use. I tasted it, and found it delicious, and when afterwards I had a big garden of my own, and could have as much as ever I liked, I wished that I could send some for my friends in England to taste. And when I came over to England on a visit, I inquired why they did not grow it as a vegetable, and was told that it would not grow properly in England. About a year ago I was coming to England again, and thought I would bring some "corn," and try to grow it, but could not get the kind of seed I wanted; however, a friend promised to send me some in the spring. One day at the railway-station, I was reading Carter's big seed advertisements, when the thought occurred to me that I would go and ask why corn was not used in England as a vegetable; and in less than an hour found myself in their grand establishment in Holborn discussing its merits, and it was agreed that if I sent for the seed, it should be tried in their trial-grounds at Mortlake. And now the summer has come and gone, and the Maize is ready to use, proving that it can be grown in England. Of course, the summer has been hot and favourable. It might not do well in the North, but I think the people of the South of England should give it a fair trial, and if it proves a success it will be a wholesome and valuable addition to the list of table vegetables. A. M. O. [The entire head of Indian Corn our lady correspondent brought for our inspection was of large size, with the grains just beyond the milky stage, and fit for consumption on being cooked. The actual culm furnished with grains measured 5 inches. Ed.]

PANSIES IN POTS.—During the time I lived with the late Mr. G. Gaines, of Battersea, we always grew our show Pansies in pots. This practice had some advantages. The pots were placed in open frames, and could be covered with lights during bad weather. The plants could be watered with judgment, and the flowers easily thinned and shadel if requisite. They were also kept free from slugs, wire worm, carwigs, &c., more easily, and they produced far better blooms than those grown in the open ground. No doubt culture in open beds produces more vigorous plants, and a more profuse bloom, with less care, but I am convinced that more perfect specimens can be grown in pots. Pansies grown for exhibition as cut flowers should first be placed in small pots, and shifted into 6 and 7-inch pots when ready. There is so much difference in the constitution of varieties of Pansics, that pots of the same size are not suitable for all. Whilst some make a robust growth, others do not, and these require a smaller pot. In pot culture charcoal is very essential to the foliage, and to brightness of colour in the flowers. It should be broken up into pieces about the size of horse beins, and may be used as dust also. The pots should be well crocked, and over these some of the rougher portions of the soil and manure should be placed. The soil used may consist of well decomposed fibrous loam, rotted cow and horse manure, and small quantities of leaf-mould, coarse sand, and charcoal. Plants for early flowering should be petted up from the open ground in October, selecting good sturdy plants. To produce a general display, Pansies may be grown in any sized pot, from 5 to 8 inches, and should receive their final shift early in February. Some who have not grown the l'ansy in pots may have little idea of the profusion of really gay flowers they will produce under such conditions; and with proper attention, the same plants will continue to flower for at least three months. At the time of which I am writing, Pansies in pots were exhibited at Chiswick for prizes, and a fine display they made. The plants may have from three to six shoots each, which will depend on the purpose they are required for, whether for cut flowers or decorative purposes. If for cutting, three will be sufficient if extra fine flowers are required, and to keep them to these shoots, a number of small ones must from time to time be removed; this will strengthen the main shoots, and give cuttings for stock. Keep the plants as near the glass as possible, and the frames open whenever the weather is favourable, either by pulling off the lights or tilting them. Attend carefully to watering, and as the plants become strong, an occasional use of weak manure-water and soot may be made. Train the plants into shape as growth progresses, and unless required for seed, remove all decaying flowers. The propagation of the Pansy is a simple operation, and almost any bed or border will answer for planting out the young stock. From such stock the most healthy plants should be selected for potting. Edward Bennett, Queen's Road, Egham.

LAW NOTES.

GARDENERS' TRADE CUSTOMS IMPUGNED.

A PROSECUTION of importance to gardeners and fruit and vegetable growers, and which was followed with interest by a large number of the principal market gardeners in West Middlesex, was commenced last Saturday before the Brentford Justices. Mr. Alfred Reffell, of Staines, Kew Bridge Market, and elsewhere, was summoned under the Weights and Measures Acts, by Inspector W. Tyler, for having used in trade a measure not duly stamped. John Mason, the evidence showed, on July 22 a-ked Mr. Reffell's salesman at the market the price of Peas a bushel, and being told, bought a busbel. They were measured in a bushel basket and tipped direct into Mason's cart. The inspector, who was standing by then seized the basket as an unstamped measure, and therefore illegal, at the same time he offered Mr. Reffell's saleman a chance to test the basket by a qualified measure, or to come to his office to get it stamped, neither of which chances were taken. The point he emphasized was, that the baskets being used as measures must all be stamped by the proper stamp, and certified as correct. It had been held, if a glass were used to measure liquid, it must be stamped, and he held this would apply to every measure. He would, however, go so far as to say if a gardener had a fullyqualified and stamped measure on his place of business, so that it could be called into use if necessary, he would be satisfied; but here there was none, nor could one be found in the market. The defendant, Mr. Reffell, stated the measure was a sieve. and was used as such in the trade, but the inspector at once told him such a denomination was illegal. A sieve was not recognised by the Act. Mr. Reffell further added it was the custom of the trade not to sell by measure, but for buyers to take the baskets of fruit as they saw them. Mostly the baskets held more than a bushel. The chairman of the Bench told him this again was illegal. Custom of trade could not over-ride the law, which required that all things should be sold by measure. Mr. Reffell added no one would deal with him if he sold by measure. The chairman rejoined that could not be helped. The law was very clear. Mr. Wm. Poupart was called as to the trade custom. He had never heard of such a prosecution. No one in the trade sold by measure, and he believed the only things he was bound to measure were Potatos. If fruit was to be tipped in and out of the measures, it would become damaged and useless; and, moreover, if baskets had to be stamped, there would be more confusion than ever, and they would have to be tested and re stamped every week, as they were constantly getting out of shape by being pushed in. Replying to one of the Bench, he said that if a person expected him to weigh any stuff, he should tell him to "tret off." He would not serve bim. The Clerk of the Court told him he would be bound to do so. The law demanded it, and every person had a right to know he was being justly served with what he ordered. Mr. Poupart observed that that would ruin the whole business. The Bench ultimately adjourned the hearing for a week, in order that both sides might go into the legal bearings of the point, and a large number of growers are anxiously awaiting the outcome of the prosecution and the point involved.

THE TERMINAL BUD IN CHRYSANTHEMUMS.

A TERMINAL bud is thus named because it terminates the growth of a shoot. Terminal bnds are the best ones to secure when growing bush-plants for the production of a quantity of blooms, or upon plants that are required for late blooming. When the object is to produce large blooms, this bnd is not satisfactory, because the flowers from such are much too small except in a few instances. In the north of England terminal buds are formed teo late to be of any use except for late decorative purposes. In the sonth, however, there are a few varieties in the incurved section that will give from terminal buds perfectly-formed flowers, if somewhat smaller in size. Take, for instance, the several varieties belonging to the Queen of England type,

is thought needful. Directly the central bud can be distinguished from those at the sides, which in their early stage cluster around the centre one, the superfluous buds should be removed. If the attempt is made too soon, however, the principal bud may be damaged. A small penknife is the best instrument to use for this purpose. The ceutre bud always develops into the largest flower. E. Molyneux.

SOCIETIES.

ROYAL HORTICULTURAL.

SEPTEMBER 8.-The last of the fortnightly meetings of this society, previous to the great fruit show to be held at the Crystal Palace on October I, took place on Tuesday last in the Drill Hall, James Street, Westminster.

The exhibits were again of a very extensive character, and

FIG. 59.—SHOWING THE "TERMINAL" BUD IN CHRYSANTHEMUMS, AND HOW TO REMOVE THE OTHERS AT THE POINTS MARKED A, B, C, D.

but excepting Golden Empress and Mrs. Robinson King. Plants of any such varieties but the two last-mentioned that form erown buds too early in August, or before the 15th, may be allowed to run on to the terminal, and they will give compact and highlycolonred blooms by the middle of November. huge examples are required, however, terminal buds must not be depended upon. Many cultivators prefer medium-sized, high-coloured blooms, and from terminal buds these are most easily obtained. Prince Alfred, and its sport, Lord Wolseley, succeed upon terminal bads in the south. This bud forms in the south usually about the middle or end of September, and some even as late as the middle of October, but in northern counties they are not produced until the latter date.

If the cultivator does not wish to allow a plant to bloom from the crown bud, this should be cut off, and the growths which start just below that point, as illustrated in fig. 59, may be allowed to extend. These shoots will later produce terminal buds. If large blooms are required, those bnds indicated by the dotted lines must be removed, or as many of these as

the hall was well filled. The show was undoubtedly more remarkable for Dahlias than any other feature, for exhibits of the flower were present in all parts of the hall, consequently the effect was a very bright one indeed. Awards were given to new varieties in many instances. There was a fine collection of Gladiolus, a strain exhibiting very great merit, from the establishment of Messrs. J. Burrell & Co., Cambridge, which was quite appropriate upon an occasion when Mr. Burrell was to deliver a lecture upon this flower.

There were numerous exhibits of plants and fruits, and Certificates were awarded to several novelties.

Floral Committee.

Present:- Jno. Fraser, Esq., in the chair; and Messrs. Jno. Laing, H. B. May, H. Herbst, R. Dean, Geo. Stevens, Jas. Hudson, H. Selfe Leonard, W. Bain, J. Fraser, J. D. Pawle, Geo. Gordon, Chas. E. Pearson, Geo. H. Engleheart, J. T. Bennett-Poë, E. Beekett, Ed. Mawley, H. 11. D'Ombrain, R. M. Hogg, Chas, Jeffries, and H. Turner.

A large exhibit of Liliums and Gladioli was mide by Messrs. Wallace & Co., Colchester. This included many varieties of L. speciosum; and L. Henryii and L. tigrinum were shown. Montbretias and Gladioli, too, were included in considerable quantities (Silver Banksian Medal).

A group of early-flowering Chrysinthemums was stage I by Mr. J. H. Witte, Numbead Cemetery, S.E.; it was fixed

with a deep band of Adiantum Ferns (Silver Banksian Medal). A few lvy-leaved Pelargonnums trained flat upon wires were shown by Mr. C. HOLIEN, Butt Line Nursery,

Hinckley.

A group of Crotons upon the floor from Mr Darkell,
Devonshire House, Stamford Hill (gr., Mr. Davies), was composed of excellently-coloured plants of varying size, which
were backed by a line of fine Palms. The exhibit was a very good one (Silver-gilt Banksian Medal).

good one (Silver-gilt Bruksian Medal).

Mr T. S. Ware, Hale Farm Nurseries, near Tottenham, arranged a group of plants in flower which possessed a very pleasing effect. It contained several varieties of Lilium and early-flowering Chrysanthemums. The background consisted of graceful Bamboos, and it was faced with Fatsia japonica and large clumps of Isolepis gracilis (Silver Banksian Madal).

A tastefully arrange1 group of miscellaneous plants was exhibited by Messrs, JNO. LAING & SONS, Forest Hill Nurseries, London, S.E. This included many choice and wellcoloured Crotons, Dracemas, and other ornamental foliage plants. Some Streptocarpus in flower, Odontoglossum grande, and a few Glovinias, served to further brighten the collection (Silver Flora Medal).

Mr. Geo. Wythes, gr. to Earl Percy, Syon House, Brentford, staged a very large group of stove foliage plants and Nepcuthes. The plants were placed on the floor of the h.l., and extended about half its length. A great number of Crotons were employed, but were interspersed with many other species of plants. The front had a wavy outline. Among the Nepeuthes there were excellent specimens, with fine pitcher, of N mixta, N. Mastersiana, N. Ruffesiana, N. Curtisii, N. Curti-ii superba, N. Hookeriana, and N H. clongata (Silver Flora Med.d)

Mr. Walter Salmon, Ivy Cottage, Elder Road, West Norwood, was awarded a Bronze Flora Medal for a very con-mendable group of cut flowers of hardy species.

Sir Trevor Lawrence, Bart., Burford, Dorking (gr., Mr. Bam), exhibited three good plants of Lobelia Carmine Gem., a variety that was given an Award of Merit at the last meeting. On the present occasion a First-class Certificate was awarded; the plants were from 3 to 4 feet high, very bushy, and possessed numerous fairly sized spikes of curmine-coloured flowers. He also showed three sweet-scented varieties of Begonia rosea, named B r. delicatissima, with semi-double flowers of a fawn pink colour; B. r. odoratissima, with semi-double flowers of a bright pink; and B. r. plena, a very beautiful flesh-coloured flower, measuring 3 inches across; average height of these plants was 20 inches. The last named variety received an Award of Merit.

Messes, J. Burnell & Co., Howe II onse Nurseries, Cambridge, made a magnificent exhibit of cut spikes of Giadioli. Very many seedlings and new varieties were included in the exhibit, and Awards of Merit were granted to the following trio: Apollo, an immense flower, in which the previding colour is flesh, but sulphur and rose are present in slight degree; Painted Lady, also a large flower, and of a somewhat bizarre appearance, through the confluent veining of rosy-red; and Alicia, a very handsome variety with almost white dowers, having purple markings in the base of interior and upon lower petal. On the spike shown there were ten open blooms of large size, beside bads. In addition to these, however, there were many other seedlings of the highest strain possible, the largest flowered of which was one named Victor (Silver-gilt Flora Medal).

Messes, Young & Postasson, Stevenage Nurseries, Herts, exhibited out flowers and Tomatos.

Three very pretty epergnes of yellow Marguerites, arranged with suitable foliage, also bouquets and button-holes made with various flowers, were shown by Miss Ellin Salmon, West Norwood (Silver Banksian Medal).

Messrs, Jas Veitch & Sons, Royal Exotic Nursery, Chelsea, exhibited a quantity of sprays of Cratagus pyracantha Lelandi, literally covered with its orange-coloured berries. They also showed a fine Fern, Polyjodium nerifolium cristatum, a handsome variety, with arching from by 3 feb. long, with widely-set long broad pinne, stipes brownish-green (First-class Certificate). They showed likewise Bagonia eudoxa, an ornamental leaf variety—a hybrid between B. decora × and B. Burkei ×. The leaf is covered with small silvery spots of about one size; and a golden form of Cedrus

silvery spots of about one size; and a golden form of Ceurus deodara they also showed.

Acidanthera bloodor. It has white flowers, consisting of five segments, ½ inch broad in middle, ½ long, with a patch of purple at the base of each; perianth tube, white and slender, 3 inches long. The flowers appear on one-sided earliescent sprays, which have a height of 15 inches. It is quite hardy at Combe Wood (First-class Certificate).

Mr. W. Butt, New Plant Establishment, Chelsea, showed

Mr. W. Bull., New Plant Establishment, Chelsea, showed Mranta picta, Dracena Rex. a large growing, broad-leaved species from Brazil, with leaves having broad lands of creamy white on each side of the central green stripe—good and distinct; Aralia triboba, a plant from New Caledonia, a tall, slender species, with tribliate leaves, 14 foot long, the petiole 4 Inches long, set alternately on the stein, which was imbranched (First class Certificate).

unbranched (First class Certificate)
Flowers of Nerine samiensis came from Mr. J. Cleock, gr., Foorle Abbey; and Centaurea americant from Mr. G. Bentaure, Royal Nurseries, Maidstone.
Aster J. Harris was shown by Mr. G. H. Stoe, gr. at Ham House, Richmond, a bright-looking, almost white flower, having a light yellow-coloured pappus or disc.
Campanula Balchiniana was shown by W. Bahchin & Son, nurserymen, Hissocks, Sussex. It is of the C. fragilis type; leaves green, bordered with white, and the flowers of a light blue colour, numerously produced. Award of Merit).
Mr. Fyfe, gr., Lockinge, showel Helianthus annous

Lockinge Favourite, a cross between H a, and H argo The flowers are intermediate in size, excepting the disc, which is comparatively spuite small, 14 inch (Award of Merit)

Mt. R. Offer, gr. Handeress Park, Crawley, showed a seedling Draggena named Warreni out of D. Gladstone and vivicans. The plant had narrow, bronzy leaves, the younger ones striped with crinson colour; the leaf-stalk also crimson, and the length of the leaf 2 feet—a fine showy variety (Award of Merit).

Lady EMILY FOLEY, Stoke Edith Park, Hereford (gr., Mr. G. Ward), showed Adiantum capillus cumeformis, a fine piece growing in a pot, and baving a height above the soil of 1; foot, and width of 3 feet (Award of Merit).

Mr. LADHAMS, Shirley Nursery, Southampton, showed Heliopsis scalera, B. Ladhams, and a variety of Pink, &c.

Mr. F. W. BURT, gr. to F. RECKETT, Esq., Caen Wood Towers, showed a group of stove plants, and was awarded a Silver Banksian Medal,

Messrs Dollie & Co., Rothesay, again made an exhibit of Asters of such varieties as were remarked at the last meeting (Silver Banksian Medal).

DAIILIAS.

Mr. S. Mortimer, nurscryman, Rowledge, Farnham, exhibited Dahlia blooms, including about 160 flowers; only Cactus, show, and decorative varieties were represented, and these were very good (Silver-gilt Banksian Medal .

Messrs, Jones & Sons, Shrewsbury, exhibited Dahlias in many diverse forms, bouquets, stands, and other devices, most of which were good; but the largest and most prominent was unfortunately of an opposite character (Silver Banksian Medal).

Messes, Keynes, Williams & Co., Salisbury, showed a small collection of Dahlia blooms, receiving several awards, WILLIAMS & Co., Salisbury, showed a which may be seen in another pruagraph.

An effective display of Dahlias was staged by Mr. Thos. S. Wang, Hale Furn Nurseries, Tottenham, single-flowered Cactus, and decorative as well as show varieties were well shown in sprays Silver Flora Medal)

Mr. J. T. Wis), Tower Hill, Brentwood, exhibited another display of Dahlias, consisting for the greater part of show varieties, but there were some good Caetus flowers in sprays, and Pompons also (Silver Flora Medal).

An exhibit of the best varieties of single-flowered Dahlias and seedlings was shown by Mr. T. W. GIRDLISTONE, Secretary of the National Dublia Society. Several of these seedvarieties were the subjects of awards (Silver Banksian Medali

Pompous and Cactus flowering Duhlias were exhibited by Mr. CHAS. TURNER, Royal Nurseries, Slough, several of these being new varieties of exceptional merit-

Messrs, J. Chilat & Sons, Crawley, were awarded a Silverpilt Banksian Modal for an extensive group of Pahlia blooms, including almost all the types. Several of the best varieties of the single Cactus form were noticed.

CERTIFICATED DAILLIAS.

Awards of Merit were made to show Dahlia Daniel Cornish Awards of Merit were made to show Bablia Paniel Cornish Cl. T. Wist), a large, full, and distinct backrow flower, the colour dull red, paler on the edges, novel in character, and libely to be very useful is a show variety. Robert Fyle, from the same raiser, in the way of Sunbeam, but with clearer yellow on the surface, and a deeper fint of colour on the reverse of the petals, will also make a useful show variety. Fincy varieties of Mabel (G. St. Primar Hamis) was scarcely in such good character as at the Crystal Palace last week, still, worthy of the award made to it. Queen of Antimu, by the same raiser, was likewise less attractive than at by the same raiser, was likewise less attractive than at Sydenham, and failed to obtain an award

New varieties of the Caclus type were numerous. New varieties of the Cartis type were numerous. Awards were made to Mrs. Leopold Seymour, in better character than at the Crystal Palace; and Mrs. Cordon Sloame; also to Harry Stredwick, shaded crimson with maroon centre, a true Cactus variety, distinct, and of great merit—all from Messrs. J. CHIAL & Sons. To Starfish, Cinderella, bright pale purple, the centre shaded with maroon, distinct, and of fine quality; Flossie, the ground colour a mixture of yellow and salmon, the florets deeply tinted with fiery cerise, very distinct in colour, and of the frue Cactus shape; and Cycle; all from Messis, Kennes, Williams & Co. Keynes' White was not in such good condition as at the Crystal Palace; and Bridesmaid, much in the way of Mrs. Leopold Seymour, lacked the refinement of the latter. To Fantasy (Burrell, & Co.), as some doubt was expressed at the Crystal Palace as to the length of stem, the exhibitors on this occasion brought up two dozen blooms to show that its length of stem is all that can be desired; the distinct, incurved, crab-chaw-like character of this showy variety is most remarkable. Iona (C. Turnara), very distinct in colour.

Some charming new Pompon varieties were staged, and Awards of Merit were made to Phryne, golden ground, edged with reddish brown, the marginal colour well defined, exquisite shape; Dagnar, maroon, with a shading of crimsen, distinct, and of fine shape; Guinevere, and Adrienne, deep orange, with shaded centre, each petal having a slight tip of gold, from Mr. C. Trusik.

Five Awards of Merit were made to single varieties shown Five Average of Merit were made to single varieties shown by Mr. T. W. Gillettertone, viz., Trilby, Naomi Tighe, Folly, Jeans ette, white, with side-margins of orange red, very protty; and Polly Eccles, all excellent additions to the choicest exhibition varieties.

Orchid Committee.

Present: Harry J. Veitch, Esq., in the chair; and Messrs Jas. O'Brien (Hon. Sec.), H. Ballantine, A. H. Smee, J. Gabriel, T. Statter, T. W. Bond, W. B. Latham, E. Ashworth, H. J. Chapman, W. Colb, J. Jaques, J. Douglas, and 8 Courtanld.

Messrs, J. Veiten & Son, Royal Evotic Nursery, King's Road, Chelsea, staged a most effective and interesting group in which all the exhibits were marked by excellence and good culture. Their novelty of the day was Cattleya × Euphrasia (C. superha & C. Warscewiczii ?), a very handsome hybrid, with well formed flowers Sepals and p.tals rich bright rose; lip as showy as that of C. Warseewiczii, and of much the same purple-erimson bue, the threat being pale yellow, with dark red lines at the base (Award of Merit). Still more showy, and with some resemblance to of alert). Still more showy, and with some resemblance to the before-named, was Ledio-Cattleya v calistoglessa varignescens (C. Warscewiczli ?, L. purpurata var. \(\pi \)), and fine examples of L.C. > Nysa, L.C. > Palks, Sobralia v Veitchii. Cypripedium v Phaedra, C. > Brysa, C. v conanthum superlum, and other typripediums well represented the better known hybrids. Among other noteworthy things were a specimen of the small scarlet Ledia nonophylla, with twenty theory v a fine form of Labo, tytichem v Schillerians. twenty flowers; a fine form of Lelio-Cattleya × Schilleriana, the pretty and rare carmine and white Saccolabium Hender sonianum, with two spikes; Odontoglossum Bictoneuse sul-phureum, which seems to be the same as that which has been known as the best form of O. B. album, lip pure white, the other segments being greenish-yellow; Cattleya bicolor, C. Loddigesii, and other Cattleyas; good plants of the Swan Orchid (Cycnoches chlorochilon), Odoutoglossum Harry-amun, Miltonia Roezlii, &c. (Silver Flora Medal).

On the other side of the stage, Messrs, F. Sander & Co., St. Albans, arranged a group, in which the centre consisted of a very fine Zygopetalum maxillare Gautieri, and around it Cattleya granulosa, C. Harrisoniae, a good panful of Habenaria militaris, Burlingtonia fragrams, Coelogyne Micholikii. litzii, Dendrobium bracteosum, Cypripedium × Regina'd iamum, C. y Calmsac, &c.

Of new plants, Messes, Sander showed Maxillaria striata grandiflora, flowers whitish with purple lines, and larger than that previously shown from Glasnevin (Award of Merit); and Cyptipedium > Rothwelliamm (Argus > Stonei), with showy flowers, the petals greenish with large chocolate blotches, dorsal sepal greenish-white with faint purple lines, and the face of the labellum of a dull rose colour.

Messrs, B. S. Wittiams & Son, Victoria and Paradisc Nurseries, Upper Holloway, N., showed a good specimen of the old Arachamthe (Vanda) Lowei, with a long raceme of flowers, with three yellow basal ones, which it is interesting to note that those who have tried fertilising the species say are the only ones which can be set for seeds. The plant not being previously recognised, secured a First class Certificate, Messrs. Williams also received a Silver Banksian Medal for a group containing excellent examples of Pescatora Kla-bochorum, P. Lehmanni, Pachystoma Thomsoniana, Oncidima dasytyle, Angreeum citratum, Cypripedium worthi, C. Adonis, C. tonsum, C. Zenanthum superbom, &c.

Barco, Sir H. Schroder, The Dell, Eghan (gr., Mr. H. Ballantine), showed a charming plant of the beautiful Sophro-Cattleya \times Veitebii (8. grandiflora %, L. C. \times degans) with showy ruby red flowers with a yellowish tinge, and with the veining very prominently displayed (Cultural Commendation).

NORMAN C. COOKSON, Esq., Oakwood, Wylam on-Tyne (pr., Mr Wm. Muranay), again sent his fine hybrid Lelio-Cattleya - Clive (L. praestans > C. Dowiana), which he first Cattleya - Clive (L. priestans > C. Dowiana), which he first exhibited at the Royal Hortienltural Society in August, 1893; it most nearly resembles b. C. x. Ingrami (L. putmla Dayama'), C. Dowiana &), and the more recently shown b. C. x. Broomfieldiense would appear to be a variety of L. C. + Clive. The sepals and petals were rosylliae, the large expanded lip dark purple in front, which deepens to moroon in the centre, the tube showing some orange blotches. First class Certificated; also Ledio Cattleya - , Bryan (C. Gaskelhama - b. crispa), a brundsome, bybrid resembling a broad petallich L. C. handsome hybrid, resembling a broad petalled L. Exonicusis, and having a fine purple-crimson lip (Award of Merit); and two plants of Cattleya × Hardyana -Cookson's hybrid (C. Warscewiczii & C. Dowiana), which were lighter in colour than the imported form.

C. L. N. INGRAM, Esq., Elstead House, Godalming (gr., C. L. N. ISORAM, Esq., Elstead House, Godalming (gr., Mr. T. W. Bond), again showed his fine Ladio-Cattleya × Charles Darwin, for which he received an Award of Merit August 27, 1895, but which now received a First-class Certificate. In form it resembled L.-C. × Atalanta, and its variety Fowlerl, the fine wax-like flowers being of a warm crimson line deepening in intensity on the blade of the lip, the profiles of which was claused highly where median portion of which was coloured bright yellow.

ELIJAH ASHWOETH, Esq., Harefield Hall, Wilmslow, Cheshire (gr., Mr. Holbrook), staged Cattleya bicolor Lewisil, a very singular form, with sepals and petals of an emeraldgreen colour, and a white lip and column, the portion of the lip beneath the column being stained purple (Award of Morit); Cypripedium > Lord Derby var., Henry Ashworth, Rothschildianna > superbiens), a pretty, light coloured form; Cattleya - Hardyana variety, one of the richest in colour, and good in form; also, flowers of two varieties of Cattleyaa tricolor,

T. STATTUR, Esq., Stand Hall, Whitefield, Manchester (gr., Mr. R. Johnson), showed a splendid inflorescence of Lelio-Cattleya . Owenia (Award of Merit).

G Short van Ball, Esq., Ashford, Wilmslow, Cheshire (gr., Mr. Hey), showed Cypripedium insigne Ballie, a fine

yellow-coloured form, with a large portion of the upper sepal

pure white, showing very faint indications of purple spots.

Walter Core, Esq., Dubote, Tunbridge Wells (gr., Mr. Howes), sent Mitonia spectabilis Moreliana, Duleote variety, a grand flower, large, perfect in shape, and of the richest dark purple colour (First class Certificate); also Odontoglossum Œrstedii major.

Welbore S. Ellis, Esq., Hazelbourne, Dorking, showed Oncidium panduravin Rolfe, a species with some resemblance to O. anthrocrene; and Stanhopea oculata; and G. O. Sloper, Esq., Westrop House, Highworth, sent flowers of Cypripedium × polystigmaticum.

Fruit Committee.

Present: Philip Crowley, Esq., chairman; and Messrs. T. Francis Rivers. Geo. Bunyard, H. G. Pearson, Jas. H. Veitch, G. T. Miles, Jos. Cheal, Wm. Pope, A. F. Barron, Alex. Dean, C. Herrin, Jno A. Laing, J. W. Bates, G. H. Sage, H. Palderson, J. Smith, G. Reynolds, and Geo. Wythes

A collection of fruit, consisting of forty-eight dishes, was shown by Mr. J. W. Miller, gr. to Lord Foley, Ruxley Lodge, Esher. It contained fine Teton de Venus, Princess of Wales (very foic), Bellegarde, and Royal George Peaches ; Rivers' Early Orange, Pitmuston Orange, Pinc-apple, Elrage, and Violet Hative Nectarines, all large and good. There were many dishes of Apples and Pears, and a dish of Jefferson Plums. The collection was deservedly awarded a Silver Knightian Medal,

From Messes, E. J. Sargeant & Co., Stratton Vineries, Worthing, was exhibited a collection of varieties of Ambergines (Solanum Melongena). This fruit is used largely as a vegetable in some warmer climates, but it is little known in England, although the fruits can generally be obtained in Covent Garden Market. White and purple-coloured varieties were

The 1st prize for Apples was awarded to a dish of Benoni's shown by Col. Egymen, M.P., Hsington House, Dorchester (gr., Mr. Jno. Powell); and Worcester Pearmain shown by Mr. C. Heerin, Dropmore Girdens, Maidenhead, was 2nd.

For Peurs the 1st prize was given to excellent fruits of Souvenir du Congrès, shown by Mr. C. Herrin; and the 2nd to Beurre d'Amanlis, from Col. Brymer, obtained from a wall tree on western aspect.

Several seedling Melons were shown, but none of them was awarded a Certificate.

A bunch of a new black Grape, named Lady Hastings, was shown by Lord Hastings, Melton Constable, Norfolk (gr., Mr. Shingles

Messrs, H. Cannert, & Co., Swanley, made an exhibit of a

good variety of Parsley, known as Eynsford Benuty.

Messrs, JNO LAING & SONS, Forest Hill Nurseries, S.E.,
staged a collection of fruits, including 100 dishes of Apples and Pears, there being many of these of capital quality (Silver Knightian Medid).

CARTER & Co., Holborn, exhibited a capital collection of Cabbages, including good specimens of such varieties as Heartwell. Large Nonpareil, East Ham, Liftle Pixie, Farly York, Large York, Sugar Louf, Jersey, Enfield Market, &c.

Lecture upon Gladioli.

In the afternoon a paper upon Gladioli, by Mr. Burkert (of the firm of Messrs, J. Burrell & Co., Cambridge) was read before a moderate attendance. Mr. Gro. Bunyard was in the chair. As there have been three papers upon the subject the chair. As there have been three papers upon the subject delivered before the Society during the last few years, Mr. Burrell preferred on this occasion to conline his remarks in great measure to certain errors that are frequently made in the cultivation of the plants.

In the first place, exception was taken to the frequently-proferred advice that light sandy soil was the most suitable which to grow the corms. This was one of the commonest and most wide-spread errors. Mr. Burrell had proved by experience that the opposite of such soil was far better; heavy yellow learn of an adhesive nature, and no sand, was recommended. The lecturer's land at Cambridge was rather too close in texture to grow Roses successfully, yet Gladioli grow, and flourished, and the stock remained healthy. These remarks were based upon results chiefly from the Gandavensis section, but Mr. Burrell doubted not that most of the vensus section, but Mr. Burrell doubted not that most of the species required similar culture, and Mr. Lemoine had declared how splendilly the hybrids which bear his name succeed in the stiff clayey soil at Namey. Good flowers might be got from corms planted in almost any soil or situation, but it was in respect to keeping and increasing the

stock that the nature of the soil became important.

Excessive manuring was an error committed by many growers. It generated disease; and the thick layers of manure (6 to 8 inches), he had seen recommended for Gladioli, Mr. Burrell regarded as pernicious. An excess of humns in the soil was harmful; the plants preferred a "clean" soil. The lecturer had tried most forms of artificial manure with very doubtful success. He preferred to use no manure with very doubtful success. He preferred to use no mulchings or liquid-manure, and emphasized the importance of "clean" culture. At Cambridge the collection is soldom or never watered. The plant enjoyed in this country plenty of heat, and a rather dry soil. The best blooms Mr Burrell ever grew were obtained in August, 1893. This year the plants grew well, and looked capital until August, but they then appeared to suffer. Doubtless they required a certain amount of maisture shortly before the flavors are decelored.

amount of moisture shortly before the flowers are developed. The fungus that attacks (Balioli was briefly alluded to, and Mr. Burrell declared he had no faith in the suggested attempt to improve the constitution by crossing again with

new species, such as G. oppositiflorus, a species that the new species, such as ℓ , apposituating, a species that the lecturer believed had been already used in the early hybridi-sation of the flower. To increase the stock it was exceed ingly important that the "spawn" or bulbils should be cultivated. Old corms could not be indefinitely preserved.

Mr. Burrell concluded by remarking upon the long season during which Gladioli flowers could now be obtained from the following sections: G. Colvillei, ramosus, Lemoinei, Nancianus, and Gandavensis.

ALNWICK HORTICULTURAL.

SEPTEMBER 3.—Another successful show has been added to the long list of similar gatherings which have been held under the auspices of the Aluwick Floral and Horticultural Society. In some respects, indeed, the show has never been excelled at Alnwick, the number of entries, 2000, exceeding those of any previous year. The season has been one favourable to gardeners, hence the extraordinarily large increase in the exhibits, and the high state of perfection which characterised every department. The show was held as usual in Hulne

The exhibits were staged in the usual manner in the large marquees belonging to the society, a fine collection of P.dras, &c., from the Alnwick Castle Gardens forming a centre-piece from which the various wings radiated.

The stove and greenhouse plants were a very fine equal lot, especially the exhibits of Mr. T. Suffield, of Darlington. They were perfect in flower and foliage, and were undoubtedly the most admired of the plant's in the tent in which they were staged. The general stock of decorative and foliage plants was far above the average of former years. As to the cut flowers, we have never seen a finer lot, and special mention must be made of the Hollyhocks shown by Mr. A. OLIVER, Cresswell. It is now over twenty years since the like has been seen at any show in the north. The hardy herbaceous plants were quite a feature of the show. The double Dahlias were far beyond previous years; and epergues, boundets, and sprays were excellent, the principal prizes being secured by Mr. Edmundson, Newcastle.

Fruit in each class was extra fine. The Grapes exhibited by Mr. D. Inclus, Howiek, were really magnificent, both in regard to size and finish; while the hardy fruits, Apples, de., were perfect specimens in their respective kinds. Mr. Ridell, Lesbury, also showed a good lot of Grapes and other plants, for which he was deservedly awarded the premier awards. In the general collection of fruit arranged for effect, Mr. Jos. Hennerson, of Chillingham, was the successful winner.

The quality of the vegetables was far beyond previous The quality of the vegetables was far beyond previous shows, both as regards the size and quality. The plants in the amateurs' department were highly creditable, and some really meritorious. For the extra prizes there was a keen competition, and a very fine lot was exhibited. Messrs. W. Fell & Co., Hexham, had a very nice exhibit (not for competition) of Roses, Dahlias, Carnations, and hardy her-broness plants, tracking with respinsive to siffere

bareous plants, together with specimen Conifers.

In the open class for six stove and greenhouse plants, distinct, the winners of the first and second places were Mr. T. Suffield, Darlington, and Mr. D. Wylam, Shankhouse. The same exhibitors were respectively 1st and 2nd in the class for four miscellaneous plants.

Mr. SUFFIELD and Mr. John Morris took the 1st and 2nd prizes for six fine foliaged plants. Mr. Sufficed was 1st for three, and Mr. A. MITCHELL, Alnwick, for a like number of

Fruit in a collection of not less than six dishes and kinds Pincapple excluded, 1st, Mr. JOSEPH ATKINSON, Matfen; and 2nd, J. Riddell, Lesbury. In the classes for Grapes, Mr. D. Isotis, gr., Howick Hall, was 1st for two hunches of Black Hamburgh, and Mr. G. Creue was 2nd. Mr. D. INGLES was 1st with two bunches of any other variety of black Grapes. with two bunches of any other variety of black trapes. For white Grapes, two bunches, Mr. J. RIDDELL was 1st with Muscats; and Mr. Atkinson, 2nd. Mr. G. Charo was 1st with any other white, and Mr. J. Atkinson 2nd. The best dish of Peaches was shown by Mr. Fordyce, Lowick; and the best peaches from a wall were shown by Mr. Maxey, gr, Craster Tower. Mr. J. Ovens had the best Nectarines.

The best collection of vegetables (twelve kinds) came from Mr. R. Davidson, Alawick.
Cottagers, allotees, and amateurs contributed excellently

in all the various classes set apart for them.

A variety of extra prizes, given by His Grace the DUKE of NORTHUMBERLAND, local individuals and the society, were keenly competed for.

THE NATIONAL DAHLIA.

SEPTEMBER 4, 5,-The whole of the "special" societies which exist for the improvement or popularisation of particular flowers, have held their exhibitions for the present year, if we except the Chrysanthemum. That of the National Dahlia Society was held on the above dates in the Crystal Palace, Sydenham, where Mr. W. S. HEAD arranged the tables in the lower half of the centre transept. It is singular that the flowers from plants which had languished the greater part of the season for moisture, and which have seldom lacked rain to a greater extent than they have during the present year, should have been prepared for exhibition, and displayed upon the show tables, at the close of a very wet week, and in the midst of a considerable downpour of rain. On Friday the attendance of visitors was very poor,

but a large number of persons were present at the 'Palice on the following day, "Considering the season" has lately become an essential part of a report of a horticultural show, but we may say (rather than again use that qualifying expression) that the show of Dahlias appeared to us a greater success than the Rose exhibition in July. Of course, the atmospheric conditions have become much modified during the past month, and the Dahlia is a plant that can soon turn better conditions to advantage.

It was not a remarkable exhibition, either for unusual excellence or for qualities of an adverse kind. The "show," "decorative," "Cactus," "Pompon," and single types were all well represented, the type giving most occasion for remark being, perhaps, that of the Cactus-flowering, by reason of the extremely numerous colours that have been obtained since the first days of the variety Juarezi. Single-flowering varieties are still less popular than they were some years ago, but the secretary of the society (Mr. T. W. GIRDLESTONE) keeps them before the public at this exhibition in such praiseworthy perfection, that they are not likely to lose popular favour entirely. Competition was greater in the amateur classes than in those devoted to the trade; indeed, in the nurserymen's classes there were prizes in many cases for each of the firms that elected to exhibit a collection. The lack of system in labelling the flowers is still a subject for regret at this show. In some cases on the occasion under notice, the flowers appeared without any names attached whatever; and unless care be taken to put the names down in a neat and legible manner it is just as well to omit them.

NURSERYMEN,

Show and Fancy Daklius. The large class for slyty blooms, distinct, was won by Messrs Krynes, Williams & Co., Salisbury, and we append the whole of the varieties in the Salislary, and we append the whole of the varieties in the exhibit. Back row: Mrs. Rendle, Buffalo Bill, Mr. Chamberlayne, James O'Brien, Peacock, Dundy, S. Mortimer (self), Emin Pacha, W. Rawlings, Duchess of Allamy, Henry Wilton, Nellie Cramond, Goldsmith, Rebecca self), Chieftain, S. Mortimer, Roy d Queen, Mr. Glassock, Florence Tranter (new), and Namy Keith. Centerrow: J. T. West, Dorothy, John Hickling, Richard Dean, Mr. Spofforth, Dr. Keynes, Alice Emily, Geo. Barnes, Rev. J. B. Camin, John Wilker, Mrs. W. Slack, W. Powell, Duchess of York, Entherency W. Lukson, Virginal Colonist, Mrs. P. Wordlem. Butterenp, W. Jackson, Virginal, Colonist, Mrs. P. Wyndham, Imperial, Mrs. Laughry. Front vice: Golden Fleece, Miss Barber, Portia, Jas. Cocker, Rebeece, Miss Cannell, H. Bond, Harrison Weir, Crimson Globe, Kathleen, A. Rawlings, and F. Pearce. There was little to take exception to in the exhibit from Mr. J. WALKER, Thame Nurseries, Oxon, who was 2nd. The blooms were of nice form and very bright, was 2nd. The moons were a mee arm and very bright. They might have been larger, however, and had there been a better admixture of the colour, the collection would have been more attractive. The 3rd prize was taken by Mr. M. V. SEALE, Vine Nurseries, Sevenoaks; and Mr. S. Morlimer, Rowledge Nurseries, Farnham, was 4th.

Forty eight blooms, distinct, were only staged by three exhibitors, and there were prizes for each of them. The difference in the quality of the blooms represented the difference in the size of them, for all of them were bright. In the first exhibit, however, there was a better selection and disposition extinut, insection, there was a sector selection and disposition of colours also, which was seriously lacking in the 3rd prize exhibit. Mr. 8 Moratura was 1st, and the following varieties were the more noticeable in his exhibit: Shottesham ties were the more noticeable in his examit: Shotlesham Hero, Geo Barnes (self), Hero, J.E. Cocker, Jino, Hickling (but scarcely full enough), A. Rawlings, Mrs. J. Downie, Duke of Fife, Glow worm, Mrs. Saunders, W. H. Williams, Hugh Austin, and Ethel Brutt in. Mr. M. V. Sente and Mr.

J WALEER, Thame, were 2nd and ind respectively,
of thirty six blooms, distinct, there were four exhibitors,
viz., Mr. J. T. West, Tower Hill, Brentwood; Messrs, C. KIMLEIG FY & SON, Stoke Nurseries, Coventry; Mr. G. HEM-MY W. Tresteer, mirserying, to the order in which their names are given, and the collec-ing the order in which their names are given, and the collections did not display any very great disparity in regard to quality. The collection from Cardiff had necessarily travelled a long distance.

Treaty-four blooms, distinct.—Mr. J. T. West won this class, and staged a very fine left, the varieties were William Raw lings, W. Powell, Duke of Fife, Duchess of York, Mr. Glasseock, J. T. West, Arthur Rawlings, R. T. Rawlings, Rosy Morn, Mr. Fyfe, Professor Fawcett, Mand Fellowes, Victor, Mrs. Gkulstone, Jno. Britton, E. Sheerman, Jno. Hickling, Jno. Walker, Hercules, Miss Hope, Harrison Weir, Geo. Rawlings, Goldfinder, and Willie Garrett. The 2nd prize was awarded to a collection, also of considerable excellence, from G. Humpheries; and Messes, G. Kimbertley & Son obtained the 3rd prize.

Twelve blooms, distinct, were well shown. The 1st prize stand in this class contained very pretty blooms and colour without exception. The varieties were, back row, Jno. Without exception. The varieties were, and Alice Emily; centre, Britton, W. Powell, Mrs. Langtry, and Alice Emily; centre, Mrs. Gladstone, J. T. West, Mrs. J. Downie, and Miss. Cannell; front row, Duchess of York, J. Cocker, J. Walker, and Dazzler. Mr. T. R. Transer, G. Hart Street, Henleyson-Thames, was a good 2nd; and Messrs, J. Cueal, & Son, Lowfield Nurseries, Crawley, and Mr. HENRY MERGER, Elton Bury. Laneashire, were 3rd and 4th respectively.

Caetas flowering rarieties. - These classes always make a very

fine display, but the quality of the blooms generally was a little below what is usual. The class for eighteen varieties. in bunches of six blooms each, was won by Messrs & Sons, who staged Fusilier, Harry Stredwick, a dark velvetyerimson variety; Beatrice, Mayor Haskins, Mrs. Barnes, Earl of Pembroke, Glori osa, Matchless, Mrs. Wilson Noble, Mrs. Peart, Pennbroke, Gioriosa, Matchiess, Mrs. Wilson Aobie, Mrs. Peart, Delicata, Mrs. Gordon Sloane, Mrs. Kingsley Foster, Bertha Mawley, Harmony, J. E. Frewer, Lady Penzance, and Mrs. Beek. Mr. J. T. West had a very pretty collection, and took premier place for twelve bunches. His best bunches were Matchless, Gloriosa, Miss Anne Jones, Lady Penzance, Fusilier, and Delicata. The firm of Messrs. Burrell & Co., Howe House Nurseries, Cambridge, were 2nd; and Mr. M. V. Seille, 3rd, who had a bailet time. SEALE, 3rd, who had a bright lot of flowers a little deficient

in size Deceative varieties.—In the class for twelve varieties, in bunches of six blooms, the 1st prize was won by Mr. M. V. SEALE, who staged Mrs. Turner, Sidney Hollins, St. Catherine, Buron Schroder. Harry Freeman, Ernest Glass, Mrs. Hawkins, Josephine, Daisy Seale, Duke of Clarence, Roy Seale, and Countess of Pendhoke, a very delicate and pretty variety; Messrs. J. Cheal & Sons were 2nd, and their stand would have been more effective had the blooms been less crowded.

Pompon Variaties.-The class for twenty-four varieties, in bunches of ten blooms each, was won by Mr. M. V. Srake, and the following varieties appeared to considerable advantage in an exhibit of commendable quality: Spittire, a new bright searlet flower; Bacchus, of almost the same shade, Phoche Cecil, a yellow seedling; Tommy Keith, Whisper, Captain Boyton, and Douglas. Mr. Chas. Turner was a very good 2nd, and included fine sprays of Adrienne, Edna, Dagmar, Claribel, Norah, Phobe, &c. 3rd, Messis, J. CHEAL

The class for twelve bunches was won by a most pretty The class for twelve binenes was won by a most pretty stand from Mr. J. T. Wesi; the varieties were Sanshine, Mary Kirk, Arthur West, Emily Hopper, Little Doritt. Doctor Jim, Madge, Little Jack, Tommy Keith, Abundanes, Little Joe, and Donovan, a very neat flower of pale and deeper like. Messrs, J. Bulling i & Co were 2nd, and had also a fine stand of blooms; 3rd, Messes, G. Kimbers Ex

Simple sharered Varieties,- Though this section apparently is less popular than previously, the stands presented an exceed ingly bright display, and to us were more attractive than some others. The 1st prize for twenty-four varieties, in learners of ten blooms each, was won by Messrs, J. Chi vi & Sons, the following varieties being very fine: Autori, Beauty's Eye, Roselank, Cardinal, Mrs. Cominck, Duchess of Etc. Michael and J. M. Sons, and C. M. Michael and J. M. Sons, and S. Sons, the following varieties being very fine: Autori, Beauty's Eye, Roselank, Cardinal, Mrs. Cominck, Duchess of Etc. of Fife, Miss Morland, Eclipse, Amos Perry, Paragon, Demon, Formosa, Duke of York, The Bride, and W. C. Harvey — Mr M. V. Sevie was the only other exhibitor of a similar collection, and he had blooms of considerable excellence.

AMATEURS.

Show and Fancy Dahlias,-Mr. R. Burein showed a very Show and Fancy Dakhu;—Mr. R. BURAIN Showed a very fine lot in the class for twenty four blooms, and was 1st Crimson Globe, Gaiety, Jas. Coeker, H. Walter, Rev. J. B. M. Camin, Vice President, Duke of Fife, R. T. Rawlings, Mrs. Saumders, Gloire de Lyon, and Perfection were especially good. The 2nd prize was taken by Mr. F. W. Fellowes, The Hame Farm, Putteridge Park, Luton, who had a The Home Farm, Putteridge Park, Luton, who had a collection of bright fresh blooms of moderate size. Mr. Tuos, Honns, Easton House, Easton, Bristol, was 3rd; and

Thos. Homs, Easton House, Easton, Bristol, was 3rd; not there were five other exhibitors.

Show Varieties. The best twelve blooms, distinct, were from Mr. A. Storling, gr. to H. H. RAPHARD, Esq., Rocecourt, Havering, Essex; Ins blooms were Mr. Glasscock, Champion Rollo, T. W. Girdlestone, J. T. West, Mrs. P. McKenzie, Mrs. W. Slack, Miss Cannell, Mrs. Gladstone, R. T. Rawlings, Win Rawlings, Willie Garrett, and Prince of Denmark. The 2nd prize was taken by Mr. S. Cooper, Hamlet, Chippen Lam, Wilts; and Mr. W. Miss, Lebtham, Kent, was ard

and prize was taken by Mr. 8 Cooffer, Hamlet, Chippen hon, Wilts; and Mr. W. Mr.), Lehtham, Kent, was ad-The 1st prize for six blooms was taken by Mr. E. J. (1994), Lengley Burrell, Chippenham, Wilts, who had capital blooms of Vice President, Majestic, Rehames, R. T. Rawlings, W. Rawlings, and Jho. Walker. The Tid prize was taken by Mr. C. F. Kerr, 10, Sunny Hill Read, Streatham, S. W., who included a poetty bloom of the variety Mrs. Langtry; 3rd Mr. A. Wester Shord. 3rd, Mr. A. MUNT, Slough.

Faucus.-There were only three competitors in the class for twelve blooms distinct, and the 1st prize was won by Mr. 8. Cooper, Hamlet, Chippenham, Wilts. All of the blooms were good, but diversity of colour was not sufficient. The varieties were Dazzler, T. W. Girdlestone, Matthew Campbell, varieties were razzier, i. n. Granesone, antenew Campaca, Mrs. Saunders, Duchess of Albany, Lottie Eckford, Frank Pearce, Rev. J. B. M. Canna, Comedian, Edmund Boston, Buffalo Bill, and a sport from Rev. J. B. M. Canna, of smaller Bullano Bin, and a sport from rev. 6, 6, 6, 6, camin, or smaller size and less bright appearance; Mr. 8, Asstrss, Brill, Bucks, was 2nd; and Mr. J. Streedwick, Silverhill, St. Leonard's

Six exhibitors had collections of six blooms, and the win-Six exhibitors had collections of six blooms, and the winning half-dozen was from Mr. W WHITTER, 5.3, Bell Street, Healey-on-Thames. He had blooms of Rev. J. B. M. Canna, Mrs. Mortimer, S. Mortimer, Grand Sultan, T. W. Girdlestone, and Dandy. The last-named being a capitally-coloured specimen. 2nd, Mr. A. Stratiene, who had a good bloom of Pearook and of Mrs. J. Downie. 3rd, Mr. R. Burots, St. Moots, Notts. Neot's, Notts.

Cartie and Decorative, mixed -- Mi Jas Sirliewick won with a capital exhibit in the class for twelve bunches of Cactus and decorative Duhlias, the varieties most worthy of mention being Goriosa, Pembroke, Nil Desperandum, Penzance, B. Keith, and Mr. Foster; Mr. W. Misr war i good 2nd, but the flowers were a little smaller, and also less bright : 3rd, Mr. Jas. Hunson, Gunnersbury House, Acton. W., with exceedingly bright but small blooms.

The best exhibit of six varieties was made by Mr S. The best exhibit of six varieties was made by air S. Cooper, Hamlet, Chippenham, who had excellent Lady Penzance; 2nd, H. G. Sloane, Esq., Hydecroft, Charlwood, Surrey; Mr. Ep. Mawley, Rosebank, Berkhamsted, was 3rd.

Cactus only, -Mr. Jas. Stretowick had a capital exhibit of nine varieties, well staged: H. G. Slonne, Esq., was 2nd: and the 3rd place was taken by H. J. Wignam, Esq., Northlands, Salisbury (gr., Mr. R. C. West).

best collection of twelve blooms of the Cactus variety, Mrs. Francis Fell, were from Mr. James Hudson. It is a new white variety, with yellowish centre, of medium size.

Pompons,-Mr. JAMES STREDWICK WON for a collection of six varieties, in bunches of ten blooms each, staging good blooms of Buchus, Tommy Keith, Red Indian, Eurydice, Favourite, and La Duchesse; Mr. Jvs. Hubson was 2nd; and Mr. L. Fewkes, Castle Bromwich, 3nd. For six bunches of six blooms each the best competitor was G. Hildirgh, Esq., Waldegrave Park, Twickenham (gr., G. Wyatt); 2nd, Mr. W. PARROTE, Sevenoaks.

Singles.- Mr. T. W. GIRDLESTONE, Sunningdale, Berks, had a magnificent collection of twelve varieties, in bunches of ten blooms each, Orange Girl, Svengali, Naomi Tighe, Mary Netley, Polly Eccles, and Donn's Cisilda, were splendid. All of the blooms were first-class. 2nd, Mr. W. Mist, who had also a good lot; and 3rd, Mr. C. Osman, South Metropolitan District Schools, Sutton, Surrey.

For the smaller bunches, the best competitor was Ed. Mawley, Esq., who had Cardinal, Beauty's Eyes (a very pretty variety), Miss Roberts, W. C. Harvey, Northern Star.

Victoria; 2nd, Mr. Jas, Hudson,

Fases of Dahlias, de.—Miss L. Hudson, Gunnersbury House Gardens, Acton, obtained lst prize in this class, show-ing a neatly-arranged epergns of grasses and other foliage, together with single Dahlia flowers of the Cactus type.

OPEN CLASSES.

Some special prizes offered by Messrs, Dorme & Co., of Rothesay, for single Cactus Dahlias, brought two collections, and by far the best was from Mr. J. Hydson, The Gardens, Gunnersbury House, Acton, who had such standard varieties as Novar, Sir Walter, Meg Merrilles, Brenda, Queen Mary, and Ivanhoe, some of the best varieties in commerce.

The class for fancy single Dahlias, i.e., tipped, striped, or edged flowers, brought a charming collection from Mr. T. W. GIRDLESTONE, Sunningdale, mostly of his own raising, which revealed the beauty of some of the later-raised seedlings. He was the only exhibitor, and had Jack Daw, yellow, freely He was the only exhibitor, and had Jack Daw, yellow, freely striped with red; Phyllis, pale ground, flaked and suffused with purple, crimson, and lilae; Hazel Kirke, orange-red, tipped with white; M.C.C., yellow ground, flaked with pale orange-red; Nau, bright red, tipped with white; Jeannetta, white, with side-margins of orange crimson; Splash, yellow, striped and flaked with crimson; Cinderella, white, with side-edgings of reddish-orange; Emutic, Folly, Trilby, and Dearest, yellow, edged with white.

Show and fancy Dullies, shown in blooms of one variety in several classes, are always a leading and interesting feature. The best dark Dahlia was Junes Cocker, finely shown by Mr. Walker; Mr. J. T. West was 2nd with William Rawlings; and Mr. A. Stanting 3rd with Prince of William Rawlings; and Mr. A. Starling 3rd with Prince of Denmark. The best light variety, other than yellow, was John Walker, shown by its name-sake; Mr. G. Hemphriss was 2nd with the same; and Mr. A. Starling 3rd with Mrs. Gladstone. The best yellow self was John Highting, also from Mr. J. Walker; Mr. Seall was 2nd with William Powell; and Mr. S. Mortimer 3rd with the same. The best timed Johnson, Starling 3rd with the same. three prizes, being shown by Messes, Sevie, J. Cheal & Sons, and J. Walker. The best striped Dahlit was Fancy Frank Pearce from Mr. G. HUMPHRIES; Mr. J. WALKER WAS 2nd with Hercules; and Mr. MORTINEA 3rd with Frank Pearce. The best edged Dahlia was Miss Cannell, from Mr. WALKER; Mr SEALE coming 2nd with J. T. West; and Mr. Mortimer 3rd with Henry Walton,

CERTIFICATES AWARDED.

Seedlings were present in goodly numbers, though but Seculings were present in goodly manners, though some few show varieties were forthcoming. Mr. G. Sr. Pierre Harris, Orpington, received two Certificates of Merit, one for fancy Mabel, delicate pinkish-lilac, flaked and striped with crimson; and show Queen of Autumn, orange-buff, with deep agricot shading—both well formed, and highly prescribed disease. promising flowers.

Of new Cactus varieties, there was a considerable number, and Certificates of Merit were awarded to the following:— Aurora, a small salmon-orange tactus of good shape, likely to be very useful for cutting, from Mr. Green, florist, Dereham; Fantasy, pale orange red, a fine new Cactus type, from Messrs. J. Burrell & Co.; Miss Webster, a very pleasing pure white decorative variety, from Messus, Dorane & Co., Orpington; Mrs. Gordon Sloane, pinkish terra-cotta, of the true Cactus type; and Mr. Leopold Seymour, yellow, the petals tipped with bright lilac, both from Messrs J. Cheal. & Sons; Iona, reddish salmon, of the finest Cactus shape, from Mr. C. Turnur; Cycle, crimson, tipped with pale from Mr. C. TORNER; Cycle, crimson, tipped with pair purple, true Cactos type; Keynes' White, white, with slight primrose centre a very promising variety; and Star-lish, pale orange-red, capital form, from Messrs. Keynes & Co., and Charles Woodbridge, bright crimson, slightly shaded, from Mr. T. S. WARE, Tottenham.

New Poinpois were quite plentiful, Certificates of Merit being awarded to the following; -Dr. Jim (West), pale

ground, heavily tipped with maroon-purple; Spitfire (Scale) bright red, fine shape; Guinivere (C. Turner), yellow, edged with deep red; and Ganymede C. Turner), pale ground, tipped with silvery-mauve, fine in form. And to the following single varieties, shown by Mr. T. W. GIRDLESTONY: Folly and Emmic, described above; also Polly Eccles, Naomi Tighe, and Trilby, all very distinct, and of the finest quality.

HONORARY EXHIBITS.

A large exhibit from Messrs. W. Paul & Son, Wiltham Cross Nurseries, Herts, included an excellent lot of fruit trees in pots bearing fruit, and a collection of fruit in dishes. a group of cut Roses, which included fine specimens of the pretty new China Rose Queen Mub.

Messrs, John Lune & Sons, Forest Hill Nurseries, London, S.E., exhibited Rose blooms, fruit trees, and dishes of fruit. Also a magnificent group of tuberous-rooted Begonias, interspersed with choice specimens of ornamental foliage plants,

Messrs. H. Cannell, & Co., Swanley, Kent, showed a capital collection of Dahlia blooms, representing the different types, and staged in very tasteful manner.

Mr. JNO. CHARLTON, Tunbridge Wells, had a collection of

hardy flowers and Lilies, the species in which had been very well enlitivated

From Mr. Thos. S. Ware, Hale Farm Nurscries, Tottenham, came a very representative collection of Dublia blooms; and Messrs, J. Peen & Sons, Roupell Park Nurseries, Upper Norwood, showed Dublias blooms, and herbaceous flowers.

DUNDEE HORTICULTURAL.

SEPTEMBUR 3, 4, 5.-The annual exhibition of this Society was opened on the 3rd inst. by Mr. Asquiii, M P, who spoke upon the historical interests of Dundee, and at some length expatiated upon the refining influence horticulture had exerted over all classes of the community; and later, at the luncheon, expressed the greatest admiration of the splendid display in the three long tents, which were quite tifled by the productions from many gardens. The honorary exhibits, arranged upon tables placed round the sides of the tents, were exceedingly attractive.

The first exhibit on entering the larger tent was one from Mr. Formes, Hawick Nurseries; it included choice Carnations in great quantity, magnificent Hollyhocks, pretty Violas, and other cut flowers.

The next long table was filled by Messrs, Donall, & Co., from Rothesay, with a grand display, and to which a Medal was axarded for the finest exhibit from nurserymen. Potatos, Leeks, and Celery; autumn-flowering Chrysanthenums in great variety, Dahlias, Gaillardias, and other flowers, were included in this exhibit.

Messrs. Stormu. & Storme's table, 36 feet long, was a

showy one, especially the Asters, Roses, Chrysanthemums, Carnitions, and herbaceous plants,

Messrs, Lairo & Sinclair had a splendid exhibit of plants, ent flowers, and floral arrangements.

Messes, Cocker & Soss, Aberdeen, had a large collection of Gladioli, Chrysanthemums, Roses, &c Mr. Eckloro, Wem, Shropshire, had a beautiful exhibit of his Sweet Peas. Messrs, Thyrick Payron, Aberdeen, had a capital exhibit of ent flowers. Messrs, D. & W. Chota, had an excellent display of flowering and folinge plants. Mr. Grossaur, of Dundee, had a large display of stove and greenhouse plants,

and also took leading prizes in those classes.

A large collection of Celosias in capital condition were very attractive, and a special award was given to Mr. Cameron, Binrock Gurdens, for his floral display.

Large exhibits of zonal and other Pelargoniums, Begonias, and Petunias were noticed, also numbers of excellent speci-Mr. SANDERS, Broughty Ferry; Mr BAIRD, Kineraig: and Mr. Cameros had the best in these classes.

A capital exhibit of Conifers come from Messrs, Laird Sinctain. These plants were in pots, and stood on the grass. Thuya occidentalis lutea was exceptionally fine; Thujopsis borealis argentea, and Golden Retinosporas were very good.

In another tent there were long tables of Gladioli, stove and greenhouse plants, &c., also exotic and hardy cut-flowers, including Roses and Dahlias. The collections of Roses from private gardens were numerous. The nurserymen's Roses were of considerable merit. For H. P. varieties Messrs. Croll. took 1st; and Mr. Cocker, Aberdeen, 2nd; and for Teas and Noisettes, Messrs. Cronn w re also 1st; and Messrs. Adam & CRAIGMILE, Aberdeen, 2nd.

The fruit filled a double line of tiddes in the centre of one of the tents. The competition in every class was exceptionally strong. Apples (from the Carse of Gowrie, and other ally strong. districts) made a great display. Pears chiefly consisted of Jargonelles and Williams' Bon Chrétien, and were not of special merit. Collections of fruit were numerous, and some of them remarkably good. Mr. Bessant, gr. at Castle Huntly, was 1st for eight dishes. He had good Muscat of Alexandria and Gros Maroc Grapes; Prin c of Wales Peaches, Spencer Necturines, good Pears, Melons, Apples, and Figs. There was much competition in this class, and also in that for six dishes of hardy fruit; Mr. Bessant being again 1st. For four bunches of Grapes, Mr. Lestle, gr., Pitcullen, Perth, was 1st, with good Muscat of Alexandric large in berry and well coloured, Gros Maroe, Madresfield Court, and Duke of Bucclouch, a little past their best. Two bunches of Black Ramburgh were best from Mr. Kinnear, gr. at Fernbrae,

who had finely-coloured, well-formed bunches; Lady Downes were mostly large in berry and well coloured -among them were the finest Grapes in the show. Mr. D. Sanders had a beautiful pair of bunches, and received a 1st prize. Alicante and Gros Maroe were in great numbers, and generally well coloured; but the bunches of Muscat of Alexandria were not

of special merit, being generally unripe.

A handsome bunch of Alicante, fairly coloured, and A handsome bunch of Aheante, tarry coloured, and weighing bulb. Coz., was exhibited by Mr. Lustic, gr., Pitcullen, and received a Special Award. Peaches were of moderate quality only. Necturines we e finer. Great quantities of small fruits were exhibited. Melons were poor throughout; and Apricots were very fair.

VEGETABLES.

These filled a large tent, and sellon have such excellent quality and close competition been witnessed between quality and close competition been witnessed between gardeners and amateurs. The 1st prize for twelve sorts went to Mr. Rae, Roxburgh, who was also awarded the Veitch Memorial Prize for his collection. This was a very meritorious exhibit, and consisted of Caulidowers, Celery, Cuembers, Cabbages, Onions, Peas, Pouttos, Kidney Beans, Tomatos, Murrows, Leeks and Carrots. In all there were 201 classes at this great exhibition, so creditable to Dundee.

WELLINGBOROUGH DAHLIA.

SEPTEMBER 5.—The first exhibition of the newly-formed Dahlia society was held in the Corn Exchange on the above date, with every prospect of its becoming an annual fixture. It is hoped by the promoters that it may become a Midland Dahlia exhibition, as there are many growers of the flower in the district. This year the Wellingborough fixture clashed with that of the National Dahlia Society at the Crystal l'alace, but another season this error will be avoided.

Six classes for Dahlias were open to all England; the 1st prize for twenty-four show and fancy went to Messrs, T. Peukins & Sons, nurserymen, Northampton, whose leading blooms were Mand Fellowes, Ruby Gem, W. Rawlings. W. Rawlings, Rebecca, Peacock, Mrs. Gladstone, Colonist, George Rawlings, Duchess of York, and A. Rawlings; 2nd, Mr. Thomas PENDERED, Wellinghorough, the president of the society.

With twelve blooms, Messrs. T. PLRKINS & Sagain 1st; and Mr. H. J. Shepherd, Althorp, 2nd. T. PERKINS & SONS Were

Mr. PENDERED fook the 1st prize for twenty-four blooms of distinct varieties of Cactus and decorative Dahlias, shown singly on boards. The leading varieties were Purple Prince, Lady Penzance, Countess of Radnor, Bertha Mawley, Earl of Lady Penzaner, Countess of Radior, Bertia Mawiey, Earl of Pembroke, R. Cannell and Delicata; Mr. J. York, Des-borough, was 2nd. With twelve blooms of Cactus, Mr. Shep-herd was 1st; and Mr. H. Brindley, Desborough, 2nd. Messrs, T. Penkins & Sors were 1st with twelve varieties of Pompon Dahlias in hunches; and also with the same number of singles. Six classes were also set apart for amateurs and cottagers, and in all there was a good competition.

Roses were also shown in a few classes. The best twelve blooms, open to alt, which included some pretty Teas, came from Messes, T. Perkins & Sons; Mr. Haves, The Gardens,

Castle Ashley, Northampton, was 2nd,

There were a few classes for plants. In that for six specimen stove and greenhouse subjects, Mr. J. IKE, Welling-borough, was 1st, with a good plant of Livistona anstralis, Yue a aloifolia variegata, with a good flower-spike, and e-quitd examples of Adiantums Oweni, grandis, Pacotti, and grandicens: Mr. Hayes was 2nd, having a good specimen Kentia australis, Stephanotis iloribunda, Nephrolepis

ex ilt.ita, &c. Plants in pots were also shown by amateurs, and they included some finely-flowered examples of Vallota purpurea.

The best collection of six distinct species of fruit came from Mr. Haves, who had Lady Downes Grapes, a fine Queen Pine, Nectarines, Figs, Melon, and Pears; Mr. J. Glannister, Hardingstone, was 2nd.

Mr. Haves had the best two hunches of Grapes, showing od Raisin du Calabre; Messrs, Clayson & Son, Wellingborough, were 2nd, with Black Hamburgh.

Mr. Haves had the best dish of Pears, showing very line

Sorvenir du Congrès; the fruits of Louise Bonne of Jersey, Pitmaston Duchess, and Marie Louise were alse very good.

Peasgood's Nonsuch led the way among culinary Apples; Annie Elizabeth was also very good. The best dish of dessert Apples was Lady Sudeley; and Worcester Pearmain was also in fine character. Plums were good also.

Vegetables were a good feature. Mr. Haves was 1st, with a collection of eight varieties; and Mr. GLANNISTER 2nd. There were several classes for vegetables shown by amateurs.

THE APIARY.

PREPARING FOR WINTER.

By the end of the present month all stocks should have been well fed, so that the combs will be sealed over, as if left till later, the bees are not likely to seal them, and, in consequence, the honey gives them dysentery, which very much weakens the steek for the following spring. Most hives will require but a small amount of feeding, as the season has been a very good one, but, of course, the rain which we have had lately will have caused a lessening of the store, so that all hives should be examined forthwith, and the

state of the food supply ascertained, and in the ease of driven bees they must be fed at once. If one or two frames of honey from full hives, where it can be spared, be given them, so much the better; and if there are any sections from last year remaining unsold, let them have these too, as it saves making syrup, and natural food is always beneficial to the hees. Use a Canadian rapid-feeder where a dozen or so of hives are kept, because it saves much time in filling cans and hottles, and also enables the bees to finish their feeding quickly, besides preventing robbing to a very great extent. Feed always in the evening; the feeder, which will hold about half-agallon, will be found empty in the morning. If necessary, fill again in the evening, then take it off and place it on next hive, and so on till the whole apiary has been fed.

Another advantage gained by using this sort of feeder is, that you can refill the feeder without moving it, and no bees can possibly interfere with the operator. In feeding, take care that there are no erevices in the roof of the hives through which bees can get, as if they can they are certain to overpower and destroy a weak stock; and if a strong lot, they will cause a great deal of mischief, and a great loss of bees through fighting.

Wasps are very troublesome at this time of the year, and the best way to keep them out of the hives is to contract the cotrance to each hive, leaving an opening of about I inch, which gives the bees a better chance of protecting themselves. Do not leave more frames in the hives than the bees can well cover, or the temperature cannot be maintained in cold weather, which is sure to result in the loss of the bees. If this be done, and a small amount of feeding as well, and the hives well wrapped up with a bag, or a tray is fitted over the frames filled with chaft or sawdust, which helps to keep the hive warm in cold weather; the feeding and warmth will encourage breeding to go on, which at this time of year is very important, as bees hatched out now come out strong and vigorous for the following season's work. If robbing cannot be prevented, sprinkle a little carbolic powder over the entrance of the hivo with a small popper-box, which will be found a very efficient preventative.

GRANULATED SECTIONS.

Where the honey in sections is found to be getting candied, dispose of it as soon as possible; and if there is no sale, run them, as run honey will keep better than honey in sections, and then if it become granulated it does not matter so much, and can be brought back to its fluid state by placing the bottles in hot water.

Variorum.

OLD AGE IN TREES. -- The rather startling suggestion is made by Mr. Henry J. Colbouron, of Woolhampton, that our oldest inhabitants-the trees-may be brought forward as living witnesses of extraordinary terrestrial disturbances of many generations ago. The British Museum contains a polished section of a large Douglas Fir, which was grown in British Columbia, and is stated to have been more than 500 years old at the time it was felled in 1885. A enrious feature of this section is the appearance of the annual rings near the close of the tree's first century, about twenty of them being so closely crowded together as to look like a differently coloured zone of wood, three-fourths of an inch wide, running around the trunk. The suddeeness of the change on both sides of the zone disposes of the idea that it was due to overcrowding in the forest, which would have come on and passed off gradually. The supposition that twenty bad seasons or twenty years of insect depredations occurred together is contrary to all our experience, and it is not easy to account for this long period of weakness in the forest giant. It appears, however, that, making allowance for some uncertainty as to the time when the tree stopped growing, the rings may be found to correspond in date with a period of remarkable convulsions recorded near the middle of the fourteenth century. Heckel's Epidemics of the Middle Ages states that the outbreak of the Black Death was immediately preceded by a period of twenty-six years—commencing in 1333—of earthquakes, atmospheric disturbanees, floods, and droughts, of an extent beyond all precedent in history. Noxious vapours arose from thousands of chasms, and the seasons seemed to be reversed. As it seems quite possible that the agencies which inflicted such dire calamities upon the human race should have influenced forest vegetation, it would be interesting to determine whether the record is confirmed in other old trees. Inventions,

PENTSTEMONS.

MUCH as Pentstemons are admired by most people, they are not the subjects of care they should be. During a severe winter, most of those left outside are killed, because no protection has been given. By treating them as tender annuals, very excellent results may be achieved. I was not aware they could be flowered so successfully the first season until a few days since, when I called at Cowdenknowes Gardens, Berwickshire. Mr. Robertson had a bed of plants which had been raised from seed sown last February, some of the spikes of flowers were 25 inches long, and 3 feet high from the ground level. The individual flowers measured 2 inches by 14 inches in diameter, and the colours ranged from pure white to various shades of red and purple. They were the finest Pentstemons I have ever seen, and much of Mr. Robertson's success was doubtless owing to the exceptionally good strain from which the seed had been obtained. Hr. H. Divers, Belvoir Castle Guedens, Grantham.

ARTHUR GEORGE MARTIN.-It is with peculiar regret, and with a sense of pain, that we record the death of Mr. A. G. Martin, until recently publisher of this journal. Our deceased colleague was never exceptionally strong, and he had assumed the responsibilities connected with the management of his department but a short time, when his health commenced to fail greatly. At the commencement of last year he was induced to spend the remaining part of the winter upon a voyage to Australia, with a view to overcoming a suspected tendency to chest weakness. Mr. Martin returned from that trip in much better health, and hopes were entertuned that he had successfully resisted one of the most insidious diseases that afflicts this country. It was not so, however. and in the autumn Mr. Martin had become so much worse, that it was thought necessary, in order to prolong his life, that he should terminate his connection with us, and proceed to South Africa with a view to settling there. This last hope has proved to be also a vain one, and he died on August 30 at Bloemfontein, Orange Free State. Deceased was only in his twentyeighth year. He leaves a wislow and one child, both of whom accompanied him to South Africa.

Mr. Martin became publisher of the Gurdow'rs' Chronicle upon the decease of the late Mr. Richards, but previously to this he had been employed in the office for some years. During the time Mr. Martin was associated with us he spared no energy in the discharge of his duties, and many of our readers who have had business relations with him, will understand why his memory will be cherished by ourselves, as of a colleague of most genial and conscientions disposition. Our carnest sympathy with Mrs. Martin, who has passed through much trouble and is now bereaved of her husband at such an early age, will, we feel sure, he shared by others who possessed any personal knowledge of our deceased friend.

MARKETS.

COVENT GARDEN, SEPTEMBER 10.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ep.]

SEEDS.

LONDON: Sept. abov. — Messrs, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., state that there were but few buyers on to-day's seed market. Some recent pure basing of red clover seed his substantially advanced values for same. Sowing orders for Trifolium and Musturd seeds now inducably diamish, both in number and size. In Rajo seed the tendency continues upwards. There is no change in seed Rye. Winter Tares keep steady alike in value and damind. Change seed exhibits an improving tone; the fat that lurkey still refrains from effering new seed is regarded as very agains att. Hemp seed is firm. Blue Peas are decidedly dearer. For Haricot Beans the market is strong.

FRUIT AND VEGETABLES.

Lavernoot: September 10. - The following are the prices at yesterday's markets:—Potatos: English Regents, 1s. 6d. to 1s. 9d. per ewt.; Kidneys, 2s. 3d. to 3s. 3d. do.; Maincrops, 1s. 10d. to 3s. 6d. do.; P. E. Kemps, 1s. 10d. to 2s. 4d. do.; Sutton's Abundance, 1s. 6d. to 2s. do.; Bruces, 1s. 6d. to 2s. 2d. do. 0. Seotland, N. Principal Wheat-producing Districts—
1. Scotland, E.; 2, England, N.E.; 3, England, E.;
4. Midland Counties; 5, England, including London, S. Princepal Graving, &c., Districts—6, Seotland, W.;
7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

The following summary record of the weather throughout the British Islands for the week ending September b, is furnished from the Meteorological Office:—

"The weather continued very unsettled in all parts of the kingdom. Rain fell almost deily at most of the English stations, the fulls over all the more southern and eastern counties being very heavy. Over Ireland and Scotland, however, the rain was less frequent and comparatively slight. Thunder and lightning occurred over south-eastern and central England on Monday, and in the south of Ireland und souths ast of England on Saturday

"The temperature was a little above the mean in Scotland. but did not differ much from the normal value over England and freduct. The highest of the maximal were recorded toward, the end of the work, when they ranged from 75 in 'Trebuck, N. 5.74 in 'England, E.,' and 72 in 'England, N. L.,' took in "England, N.W.' and 'Trebuck, S.,' and to 65' in Scotland, N. The lowest of the minima, which were

registered on rather irregular dates, varied from 35 in 'Ireland, 8., '37' in 'Scotland, N.,' and 41' in the 'Midland Counties,' to 51 in 'England, 8.,' and to 54 in the 'Chunnel Islands

"The ramfell greatly exceeded the mean over central, southern, and eastern England, as well as in the 'Channel Islands,' and was rather above the normal over south-western and northern England. In Ireland and Scotland, however, the fall was less than the mem. The total fall for the week exceeded 2 inches at many of our southern stations, the largest amounts recorded being 3°21 inches at Jersey, 3 25 inches at Hurst Castle, and 3 45 inches at Weathourne

"The bright sun-hane was very deficient in nearly all parts of the kingdom, but exceeded the mean in Scotland, N., of the kingdom, but exceeded the mean in 'Scotland, N.,' and was also fairly prevalent at a few isolated stations in other districts, notably, at Margate and in the Scilly Islands. The percentage of the possible duration ranged from 30 in Scotland, and 22 in 'Ireland, S.,' to 11 in 'England, E.,' 10 in 'England, N.W.,' 6 in the 'Midland Counties,' and 4 in 'England, N.E.' In some of the inland countries bright sunshine was extremely deficient; thus, at Cambridge, only 4 per cent of the possible amount was recorded; at Harrogate, 3 per cent; at Durham and at Thurcaston only 1 per cent; while at Workson the week was altogether sunless." cent.; while at Worksop the week was altogether sunless

TRADE NOTICE.

MR. H. PEWTRESS, late of Hampton, Middlesex, and his brother, Mr. T. Pewtress, of Bishopstone, Hereford, have taken the Tillington Nurseries, near Hereford, which for many years was carried on by Mr. T Griffiths, and intend to trade under the title of Pewtress Brothers.

CARNATONS DISEASED: J. L. B. The disease in each case is caused by the Spot fungus (Helminthosporium). Plants very badly affected should be thrown away, and steps taken to rid those remaining of the post by taking away at once all leaves so affected, and continuing to remove others as they may show signs of the disease, until the plants are elean.

GRAFES: G. D. Bowood and Alexandria Muscat are identical.

INCREASING AMPLEOUSIS VEHICIH: Amp logisis. Take, in September, cuttings of ripe wood 9 inches long, and insert them for three quarters of their long, and insert them for three quarters of their length in a bed of sandy soil under a handlight, in a partially shady place. Take cuttings of young growing shoots in the spring, preferably from a plant started in gentle warmth early in March, and trike in mild bottom-heat, say, 70 to 75°. long shoots, without detaching them from the parent plant, and lay them on the surface of the soil, securing them with wooden pegs at short intervals, covering the shoots at those points with a little soil. This last method will furnish with certainty a number of plants. It should be done in June and July.

INSUETS: W. W., Harefield.-The common slugworm, Selandria atra, a very destructive post.

KAINIT AND GYPSUM: C. II. II. Either or both together are good materials to incorporate with the soil in which stone fruits are growing.

MELON PLANT WITH A FRUIT FORMED AT THE COLLAR: IV. S. T. An unusual occurrence. Could you send a photograph or a drawing of the same?

NAMES OF FRUITS: J. K. B. I, Blenheim Orange; 2, Cox's Orange; 3, Warner's King; 4. Reinette du Canada; 5, Cellini; 6, Pott's Seedling. The fruits of last year were useless-almost rotten.-H. Wigley. Apple Gloria Mundi.—J. W. Pears:
13. Beurré J'Amanlis: 14, 15, Williams' Bon
Chrétien: 16, Louiso Bonne of Jersey. Apples:
1, Gloria Mundi: 12, Golden Noble: 3, Yorkshire Beauty; 9, Red Quarrenden. We can only under-take to name six fruits at a time.—W. C. Plum, Damas de Septembre.

Names of Plants: Correspondents not answere t in this issue are requested to be so good as to consult the following number,— J. Banden. Cledha alnifolia.— W. P. 1. Pteris serrulata; 2, P. serrulata cristata; 3, P. cretica albo lineata; 4, Doodia cordata. 5, Gymnogramma ochracea; 6, Doodia caudata,-II

A. M., Munches, We know of no yellow-flowered Cosmos, there are scarlet and purple-flowered species. The foliage looks like that of C. bipinnatus, which has rose or purple flowers with a yellow disc. The other flower sent is Coreopsis auriculata; a native of the U.S.A., and perennial.—T. C. 1, Cratægus Crus-galli; 2, Rhus Cotinus; 3, Salix cuprea; 4, Juniperus excelsa; 5, Hypericum patulum; 6, Acer plantanifolia.—J. P., Donegal. Potentilla fruticosa.—C. J. Lycium barbaram, with the berry; Rhus typhina, the leaf.—D. B. R. The white one is Cattleya Eldorado Wallisii; the other C. labiata Luddemanniana, generally called in gardens C. speciosissima.—Fircroft. Your flower is Dendrobium taurinum.—Constant Subscriber. Cassia corymbosa.—S. J. G. 2, Croton undulatum; 3, Dracena amabilis; 4, D. Fraseri; 5, Alo-Veitchii; 6, A. (Colocasia) antiquorum.-W. H. Patterson. Sagina apetala.—Sir G. B. Blitum 11. II. Paterson. Sagua apetaia.—Sir G. B. Bittum virgatum.—Main & Sons. Festuca prateusis.—
J. L. Clucas. Alousoa caulialata. J. Morley. 1,
Salix aurita; 2, Lythrum Kennedyanum; 3,
Stenotaphrum americanum; 4, Teuerium chamadrys; 5, Glyceria aquatica; 6, Spiraea cauesceus; 7, Hyssopus officinalis; 8, Alyssum maritimum; 9, Artemisia maritima.—L. B. G. Hardy plant Hiblscus syriacus (Althaea frutex of gardens). Others next week.—E. J. 1, Jasminum revolutum; 2, Cassia corymbosa; 3 and 4, next week; 5, Grevillea rosmarinifolia.

Pears Diseased: A. B. The granulation complained of in the flesh of your Pears is not uncommon with some varieties -more especially Marie Louise. We have believed it to be due to the roots getting into bad soil; and Marie Louise is a deep rooter on the Pear stock. Improve the soil.

Photograph to Copyright. G. II. You should direct your enquiry to the Copyright Office, Stationers' Hall, London, E.C.

Preserving Cactus Daulia Blooms: C. M. R. No method of preserving that we know of will preserve the colours intact. You might dry them, and after exposing them to the vapours of burning sulphur in a close box to bleach them, dye them of any desired colour.

STOCKS AND DAHLIAS WITH DOUBLE FLOWERS: C. M. R. None of the so-called double-flowered Stocks are quite destitute of the organs of reproduction, and seed is saved from the organist reproduction, and seed is saved from the more double ones that chance to be self or cross fertilised. It is the same with Dahlias, although frequently their sports give new colours.

ZONAL PELARGONIUM BLOOMS: H. Cannell. tremely large, and generally of unusual thickness; the purplish coloured variety is novel. We do not like the suggested name for this strain, viz., "Zoual tuberous Begonia Pelargoninus," it being unhandy, and likely to lead to mistakes.

Communications Received. G. N. G. Burrows (too late) -Low & Co.-G. H.-Kilmright.-A. M.

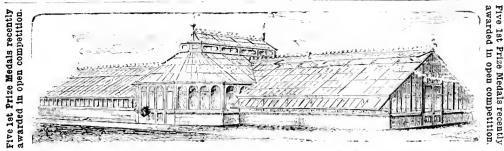

DIED.—On August 30, at Bloomfontein, Orange Free State, South Africa, in his 28th year, ARTHUR GEORGE MARTIN, late Publisher of the Gardeners' Chroniele.

CONTINUED INCREASE in the CIRCULATION OF THE "GARDENFRS' CHRONICLE."

NOTICE TO ADVERTISERS.—In many instances
Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others .- It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may full from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements. 41, WELLINGTON STREET, STRAND, W.C.

MIDLAND COUNTIES HERALD

SUPPLIED FREE FOR SIX WEEKS,

on stating the purpose for which the paper is required, forwarding Name and Address, and six halfpenny stamps for postage, addressed, "Midland Counties Herald Office, Birmingham." The Midland Counties Herald always contains large numbers of advertisements relating to Farms, Estates, and Residences for Sale and to be Let.

ESTATE SALES.

The Best County Medium for Advertising Sales of Estates.

"WORGESTER HERALD,"

ESTABLISHED 1794.

The Leading County Paper. Extensive circulation among the upper and middle classes in Worcestershire and adjoining counties. Advertisers would do well to forward for reference and distribution plans and particulars of Estates, Catalogues of Machinery, Furniture, Books, and other property advertised in the columns of the "HERALD."

Sales of Stock and Agricultural Effects.

The "WORCESTER HERALD" is the most effective organ for giving publicity to announcements of this class. It is the leading Agricultural Paper in the County, and Circulates most extensively among Agriculturists in and around Worcestershire.

Norcestershire. Farms to Let.

Land Agents, Estate Managers, and all having Farms to Let, would do well to advertise in the "WORCESTER HERALD," the leading County Paper. Specially adapted for bringing such notices before Tenant Farmers. Large circulation.

Moderate charge.

Situations Vacant and Wanted.

For producing results the "WORCESTER HERALD" is recognised as a specially good medium. Cheap Rates.

HEATH & SON, CHELTENHAM.

Beg to call attention to their immense Stock of the above, now ready for delivery. The plants are of the finest possible quality, and include all the best varieties in the Hybrid Perpetual, Tea-scented, and other classes: -

Extra sized plants, established in 8-inch pots, suitable for forcing \ 30s., 42s., and 60s. per dozen; and general pot culture £10, £12, £15, and £18 per 100.

Standards, established in pots, fine for Conservatories .. 3s. 6d. to 5s, each; 36s, to 54s, per doz. .. 7s, 6d, to 21s, each. . .

Plants on their own roots, established in 5 inch pots, suitable for \(\right) 10s \) 6d, to 18s, per dozen. present planting or for pot culture £4 Is. to £6 per 100. . .

The Stock of Roses in the open ground for Autumn Delivery is also this year unusually extensive, and unsurpassed in quality.

DESCRIPTIVE PRICED CATALOGUE, post-free on application.

PAULS' NURSERIES, WALTHAM CROSS, HERTS.

THE CELEBRATED

The Cheapest, Most Simple, and Best Fumigator in existence. A Liquid Compound simply Evaporated from a Small Copper Cup by the Agency of a Spirit Lamp.

Prepared in Bond, from Duty-Free Tobacco, by Special Permission of the Hon. Board of H.M. Customs.

One funigation with this clears houses of insects for double the length of time that can be accomplished by the use of any other Fumigator. Note the remarkable saving of expense:-

Compound

For using in the Fumigators.

Little.		Enough for cubic feet,	3.	d.
No. 1	 	40,000	 24	O
No. 2	 ٠.	20,000	 13	0
No. 3	 	10,000	 6	G
No. 4	 	5,000	 3	3

PATENT No. 11,297.

Fumigators

(Will last for Years)

To do 5,000 cubic feet of space at a time, 2s. each.

To do 2,000 cubic feet, 1s. 9d. each,

* .* Showing a cost for fumigating of only 8d, per 1000 cubic feet of space.

TESTIMONIAL.

From W H WHITTAKER, Garden or to Sir Unckman B Bacon, Bart. Thonock, Gainsborough.

"I am truly pleased to add another to your list of testimonials, as your Funngator is unloub'edly the best I have ever u ed. I find it certain death to all insect tests, whilst the most tender folonge is not hart in the least. When I took charge here, the Peach house was in full bloom, and was infested with both scale and life. As you remember, I wrote, asking if you considered it safe to funnigate under the circumstances. I followed your advice, and the result was surprising; after once funnigating, the fly was all fead, and most of the scale. I told this to a neighboring grather, who, out of curiosity, came to witness my second application, which was in the evening; next morning, we found all the sixte, o'd and young alike, 'q lite dead.' My friend, I ke myself, was delighted. I give him circulars, which he took to his employer. Mr Pearson Morton House, Gainsborough, whom I understand obtained a No. 2 Set, which has given every satisfaction. After using your Funngator, one feels he cannot prace it too much."

To be had from all Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from the Sole Proprietor,

C. H. RICHARDS, OLD SHOT TOWER WHARF, LAMBETH, LONDON, S.E.

HALE FARM NURSERIES,

TOTTENHAM, LONDON.

FROMOW AND SONS beg to draw

the attention of Planters generally to their extensive and varied Stock at their Nurseries at Windlesham, Bagshot, Surrey. The plants are all very carefully grown, and cannot possibly be in letter condition for removal, everything having been transplanted within two years, and much of it during the past season. There is a much larger stock than in Mr. R. Maron's time, W. F. & Sons having added a large farm at Astage Hill, adjoining part of old nurseries, which is well stocked with good and useful things well worth ins; extion.

Fescriptive Citalogues on application.

Gentlemen visiting the Nurseries would be met at Sunning-dale or Bagshot Stations by appointment.

The following are a few items of the Stock to offer.—

100.000 SHEURS, for potting, boxing, and winter-gardening 30,000 DWARF and CLIMBING ROSES.

4,000 STANDURD ROSES.

4,000 BRIGHT TREES.

200,000 PRIVET OVALIFOLIUM.

49,000 Best GOLDEN PRIVET.

100,000 Other AMERICAN PLANTS.

50,000 SFANALE, for forcing.

50,000 SFANALE, for forcing.

50,000 SFANALE, for forcing.

50,000 RISH IVIES, in and out of pots, I to 12 feet.

10,000 Standard PLANES, LIMES ACACIAS, and ORNAMENTAL TREES, DUTCH and OTHER BULBS of all kirds, at moderate prices.

Mason's Nurseries Windlesham, Eagshot, Surrey; also Chriswick, Heunslow, and Acton Green.

TO THE TRADE.

DUTCH BULBS! FRENCH BULBS and ENGLISH BULBS.

SATURDAY, SEPTEMBER 19, 1896.

PLANT-BREEDING.

WE are most of us now-a-days so much accustomed to see our gardens or our houses bedecked with flowers, and our tables supplied with vegetables and fruit, that we take these things for granted, and do not trouble to inquire whence they come or how they are produced. But if we look back even a few years, we shall see how much larger a share plants have now in our lives than they had then. We shall see, moreover, that while there has been enormous manerical increase, there has also been in many cases continued progression in form and other attributes. We are not concerned here with the introductions from foreign countries, important though they are; our business for the memont lies with the changes resulting from the natural processes of variation as controlled by the art of the gardener. The garden Roses of to-day, for instance, are not the Roses of a dezen years ago; and as to the sorts that were grown by our fathers and grandfathers, they have, with some few exceptions, utterly gone. It is the same with Peas and Potatos, and with most other plants that are grown on a large scale. True, there are some exceptions; there are some "good old sorts," which seem to show by their persistence that they are the fittest to survive under existing conditions. The Black Hamburgh Grape is an illustration, the old double white Camellia is another; but these plants are not re-produced by seed, and therefore do not invalidate the rule, that each succeeding generation of plants differs in some degree from its predecessor. At first the differences are slight, and it may be imperceptible to all but the trained expert; but they become more accontuated as time goes on, till at length they eventuate m forms so different from that from which they sprang, that they would undoubtedly be considered of specific if not of generic rank, were not their history known. The Jackman Clematis and its near allies may be cited as cases in point; and still more remarkable are the tuberous Begonias, which, like the Clematis just mentioned, have been created, so to speak, within the last quarter of a century, and which are so different from anything previously known amongst Begonias, that they have actually been rasied to the dignity of a genus by M. Fournier, a French botanist. Pansies and Auriculas — garden productions both are now, morphologically speaking, as good species as are most of the groups of indi-

viduals to which this rank is assigned by naturalists. Of their seedlings a large proportion comes true-that is, the parental characteristics are so far reproduced that there is no greater amount of variation among the offspring of many of these artificially-made species than there is in the progeny of natural species. If, as is the case in some Auriculas and the goldlaced Polyanthus, we find little change has occurred during the last few years, may not this relative invariability be the result of the gradual assumption of a degree of stability which we usually associate with the idea of a species? Again, it often happens that these high-bred, close-fertilised plants become sterile. so that their continuance can only be ensured by cuttings, or some means of vegetative propagation. Is not this analogous to the retrogression and ultimate extinction which occur in natural species? It is not necessary here to cite more illustrations; our concern lies rather with the way in which these changes are brought about. This leads us to what is called the imprevement of plants, or plant-breeding. There seems to be a growing tendency to make use of the latter term; but if it is to be adopted, it must be taken in a broad sense, and not limited to the results of sexual propagation.

The two methods made use of by gardeners and plant-raisers for the improvement of plants are selection and cross-breeding—the latter, as far as results are concerned, only a modification of selection. The natural capacity for variation of the plant furnishes the basis on which the breeder has to work, and this capacity varies greatly in degree in different plants, so that some are much more amenable and pliant than others. The trial-grounds of our great seedsmen furnish object-lessons of this kind on a vast scale. Very large areas are devoted to the cultivation of particular varieties of Cabbace, of Turnips, of Peas, of Wheat, or whatever it may be. The object is two-fold-primarily to seenre a "pure stock," and secondarily to pick out and to perpetuate any apparently-desirable variation that may make itself

The two processes are autagonistic—on the one hand, every care is taken to "preserve the breed," and to neutralise variation as far as possible, so that the seed may "come true;" on the other hand, when the variation does occur, the observation of the grower marks the change, and he either rejects the plant, manifesting it as a "rogus," if the change is undesirable, or takes care of it for further trial, if the variation holds out promise of novelty or improvement. It is remarkable to note how keen the growers are to observe the slightest change in the appearance of the plants, and to eliminate those which do not come up to the required standard, or which are not "true."

Where the flowers lend themselves freely to cross-fertilisation by means of insects, as is the case with the species and varieties of Brassica, it is essential, in order to maintain the purity of the offspring, to grow the several varieties at a very wide distance apart. In passing along the rows or "quarters," the plant breeder not only eliminates the "rognes" and reta us what he thinks may be desirable variations, as we have said, but he specially marks those plants which most conspicuously show the characteristic features of the particular variety he desires to increase, and he takes care to obtain seed from the plants so marked. The variety thus becomes "fixed," but it is obvious that that word is only used relatively; really, there is a constant change, which may be either in a retrograde direction, or which may be looked on as an amelioration. Thus, in the seedsmen's advertisements we see announcements of this character: -"So and so's Improved Superlative Cuember," or whatever it may be. This "improvement," when it exist is the result of the careful scrutiny, elimination and selection exercised by the raiser. These are repeated season after season, till a degree of fixity is attained, and a good strain " is produced.

Fierce competition and trade rivalry forbid the growers to relax their efforts, and thus it happens that the Pea or the Potato of to-day is not the same, even though it may be called by the same name as its predecessors. To the untrained eye, the primordial differences noted are often very slight; even the botanist, unless his attention be specially directed to the matter, fails to see minute differences which are perceptible enough to the raiser or his workmen. Nor must it be thought that these variations, difficult as they are to recognise in the beginning, are unimportant. On the contrary, they are interesting physiologically, as the potential origin of new species, and very often they are commercially valuable also. These apparently trifling morphological differences are often associated with physiological variations which render some varieties, say, of Wheat, much better enabled to resist mildew and disease generally than others. Some, again, prove to be better adapted for certain soils or for some elimates than others; some are less liable to injury from predatory birds than others, and so on. These co-relations, then, are matters of the greatest importance to the biologist intent upon the study of progressive modification, and to the merchant and the cultivator for practical reasons.

So far we have been alluding to variations in the plant as grown from seed, but similar changes are observable in the ordinary buds, and gardeners are not slow to take advantage of these variations. The buds taken from the base of a plant not unfrequently differ from those which are developed higher up, and these differences are perpetuated by propagation by means of cuttings or grafts. An interesting illustration of the variability in flower-buds is furnished by the gigantic Chrysanthemums which attract so much attention in late autumn. Without entering into technical details, it may be briefly stated that the cultivator selects certain buds, or one bud occupying a special position, and pinches off and rejects most or all the others. The result is not only a flower-head of large size, such as we might expect under the circumstances, but also, in very many cases, one which presents different characteristics to those which are manifested by the other buds when allowed to develop themselves. "As like as two Peas in a pod" is, therefore, a motto which has not the significance it had before we had observed that the Peas are mostly different, sometimes very much so, and the same thing happens, as has been shown, in the ordinary leaf and flower-buds; doubtless each cell has its peculiarity, which only awaits a Rontgen ray or some other means to become visible.

Before we leave the subject of buds, some mention may be made of that form of bud-variation which the gardeners speak of as "sporting." Sports are bud-variations which occur suddenly, without assignable cause, and often simultaneously in different regions widely separate. Thus we get Peaches and Nectarines on the same bough, black and white Grapes on the same shoot or even in the same bunch, finelycut leaves on a branch that normally produces broad or entire leaves, and so on. The gardener who is on the alert takes care to remove such buds, and to propagate them by cuttings or grafts. If raised from cuttings or layers, the duration of the sport is indefinite; if propagated by grafting, their duration is naturally conditioned by the life of the stock. The problems afforded by sports are of great interest, and are by no means fully solved. Many of them may arise from atavism, or a reversion to an ancestral condition; but of this there is no proof, neither can we appreciate the reason why such reversion should take place. Some may be the result of the dissociation of previously mixed characteristics. Of this we frequently see unmistakable evidence. Thus hybrid Berberries frequently show on the same plant an unmixing or separation of the characters belonging to the two parent forms.

This brings us to the subject of crossing-breeding as a means of obtaining new or improved varieties. Cross breeding may occur in all degrees from the case where the pollen of one flower is transferred, by insect or other agency, to the stigma of another on the same branch, to that in which the pollen is transferred to the flower on a plant of a different species.

Watch a bee travelling over the great disc of a Sunflower, and it will become obvious that (always provided the stigmas be in a receptive condition) cross-fertilisation of neighbouring flowers must take place.

There are endless adaptations which ensure crossfertilisation, and ou the other hand there are very numerous structural arrangements which necessitate close fertilisation, or the fertilisation of a flower's ovules by pollen produced in the same blossom. In view of the copious literature on this matter, it is not necessary here to enter into further detail. It is enough to say that some of the most astonishing results of the gardener's art are due to this practice of repeated cross-fertilisation. When the cross is effected between plants of two different species the term "hybridisation" is made use of, but it is obvious that there is only a difference of degree between the fertilisation of different flowers on the same plant and that of flowers belonging to different species, or even genera.

The tuberous Begonias, before alluded to, are the results of the successive intercrossing or hybridisation of several species, and the result is the production, within little more than a quarter of a century, of a race or garden-group, not be matched in nature, and so distinct as to have been thought worthy not merely of specific but of generic rank.

Many recognised genera, we might even say most, are not so sharply differentiated as are these Begonias from others of the same family. These extreme crosses apparently are not effected under natural conditions, and some botanists even hesitate to admit the occurrence of hybrids in Nature except under very exceptional circumstances. The gardeners and cultivators, however, have long considered certain forms to be of hybrid origin; and one of the most interesting things in this connection of late years is the positive evidence which cultivators have been able to bring forward as to the existence and the parentage of natural hybrids. Certain Orchids, now rather numerous, were, from the appearances they presented, assumed to be "natural hybrids" hetween certain species. That such assumptions were correct has now been proved by the production in our Orchidhouses of forms judistinguishable from those met with in a wild condition, as the direct consequence of the designed fertilisation of one flower by the pollea of another.

Fairchild, a nnrseryman at Hoxton, and the founder of the flower-sermon, was the first on record to raise a hybrid Pink. Indeed, this is the first artificial hybrid of any kind on record, and it dates from 1719. From that time to this, gardefiers have gone on selecting, cross-breeding, and hybridising. At one time some good folk looked askance at such operations as an interference with the laws of Providence. So much was this the case, that one eminent firm of nurserymen in the oarly part of the century led their customers to believe that certain heaths (Ericas), which they had for sale, were imported direct from the Cape of Good Hope, instead of having been raised by cross-fertilisation in their own nurseries at Tooting!

Gardeners for the most part pursue their experiments with no scientific aim. The names of Philip Miller, Thomas Andrew Knight, and of Dean Herhert, amongst others, suffice, however, to show that some gardeners appreciate the deep sciontific value of these every-day procedures. From the labours of these men and their successors, it is made obvious that the cultivator, by availing himself of natural tendencies and natural agencies, and by his power of eliminating conflicting or unpropitious elements, does actually bring about, in a relatively very short period, the same results that occur under natural conditions only after the lapse of a prolonged period. Do not these facts show the desirability for our own biologists to study carefully the results obtained by the gardener, and better still to enter, as their great leader Darwin did, the field themselves as experi-

There can be few departments in which greater promise of important results can be held out. Macwell 1. Masters, in "Nature."

NEW OR NOTEWORTHY PLANTS.

DENDROBIUM JENNYANUM, Krzl., n. sp.*

A NEW giant Dendrobe, of Eastern origin. resembles D. undulatum, but differs in the size of the plant and that of the flowers, but principally by the following characters: -I. The sepals are broader, not twisted, not even waved on the borders, but simply reflexed. 2. The petals are longer than in D. undulatum, with scarcely one torsion, and the borders are not waved. 3, The lip is broadly expanded, the side lobes very large, the middle one short, broad, nearly twice as broad as long, with a short apiculus, whereas in D. undulatum it is lanceolate and acuminate. The colour is yellowish outside, on the inside brown, and varnished all over. The lip is paler, especially in its basal part, and is adorned with chocolate-brown veins; the calli are whitish, and pale violet at their base. The dimensions are much greater than in D. undulatum, Mirbelianum, and the rest of this group of the "Antennata" section, the flowers being more than 1½ inch long and wide, measuring from sepal to sepal. The plant was imported by Mr. Zollinger-Jenny, at Zurich, Switzerland, and flowered with him in August. It is not a beauty in the way of the Indian Eudendrobia or the D. Phalænopsis varieties, but its stately form, and the richness of its long racemes make it, nevertheless, a lovely plant. F. K.

BROUGHAM HALL, WESTMORE-LAND.

AMONOST the old baronial balls of England, not the least in point of historical interest is that of Lord Brougham and Vaux. It is a fine old building, halfcastle, half-mansion, and stands in a pleasant situation. It is about 11 mile from the quaint old town of Penritb, with its ruined castle. Anyone of an antiquarian turn of mind might spend a delightful holiday at Penrith. There is a British circus or camp on the banks of the Lowther, directly opposite to Brougham. This is said to be King Arthur's Round Table; but long before "King Arthur," or "Elaine," or "Sir Lancelot" were thought of, the Romans had established themselves at Brougham. There is nothing mythical about the Romans or their remains, for here are undoubted traces of their great roadways and encampments. Brougham itself was an important Roman station; the remains of a Roman camp have been found near the Hall, and a field in the vicinity appears to have been used as a burial-ground.

Stukeley, writing in 1725, says, "The trace of the Roman city is very easily discovered, where the ditch went between the Roman road and the river. I saw many fragments of altars and inscriptions at the hall near the bridge, all exposed in the courtyard to weather and injuries of every sort."

Stukeley had an eye for the picturesque, and was delighted with Brougham; describing the view from the British circus or camp, he says: "The rapid river Lowther, all along the side of it; the Eamont joins it a little way off, in view. Beyond is a charm-

ing view of a vast wood, and of Brougham; beyond that the ancient Roman city, and the Roman road going along under the high hill whereon is the beacon." Many changes have taken place since those days. The old castle yet stands; the beacon is on the hill, but its light is quenched. Brougham is there, but it is adapted to modern requirements. Much of the vast wood has been cut down, but trees have been planted, and the visitor may see what Stukeley probably did not, a well-kept garden, under the care of an excellent young gardener, Mr. Taylor. I called at the place on my way south from Newcastle flower show, where it was, as usual, raining heavily, and I was shown the gardens by Mr. Taylor also under the depressing influence of a wet day. I did wish, as it poured down all day long and all night, that the rainfall could be more equally divided, for at Penrith their average rainfall is about 40 inches. Near London it is about 20 inches for the year. One feature especially struck me, and that was the greenness of the vegetation, so different from the then rusty appearance of everything in the south.

The gardens are extensive, and, owing to what they term there a dry season, the crops of fruit and vegetables are excellent. The favourite flower at Brougham appears to be the Carnation. The older border varieties are extensively grown; the best of them are Ketton Rose, of which 300 plants in one bed made an excellent display, but which was surpassed by another hed of Duchess of Fife, containing 600 plants; the lastnamed is a fine, pale rose-coloured variety, which ought to have been named The Burn or Burn Pink, Duchess of Fife being a synonym only. Countess of Lonsdale is a salmon-pink coloured variety; The Duke is a pretty rosy-salmon. Mr. Taylor has some large beds of seedlings from good parentage, and the beds of seedlings make a rich and varied display of delightfully fragrant flowers. Many persons do not sow the seed sufficiently early in the year, the result being a poor show. I had a bed of seedling Carnations this year, and upon some of the plants 100 flowers were open at one time, and some plants had 200 flowers and flower-buds upon them. The seed was sown the third week in March. The end of the month of March or early in April is the best time to sow,

Some amateurs complain that the seed does not vegetate, and the fact is usually due to the soil having been allowed to become too dry during the process of germination. But this is a digression suggested by the subject. In one of the houses was a fine batch of M.d. mison varieties, the pink and blush varieties being chiefly grown, with only a few of the scarlet Madame Warocqué. Like many other growers, Mr. Taylor has been troubled with the Carnation-rust; but he is dealing with it in the best way, by picking off all the leaves as they become attracked by it. This will cure the worst cases; but it must be done persistently until all traces of the disease have disappeared.

The varieties of Tree Carnations here are very limited in number, MdHe. Therese Franco and Miss Joliffe being the best pinks, and Winter Cheer the best scarlet. The plants in all the houses are well grown, and as Mr. Taylor is a disciple of Mr. Letts', this is only what one would expect. There are fine examples of Dipladenia amabilis in the stoves, and of Darwinia macrostegia in the greenhouse; but plants that are suitable for furnishing and will produce flowers for cutting, are most desired in this and similar country gardens. There is a stock of clean healthy plants of Eucharis grandiflora, and with them a few Pancratiums, of which the most useful is P. fragrans. Some of the more useful species of Orchids are grown, and such Dendrobinms as D. Wardianum, D. nobile, with a few plants of D. chrysauthum, were ripening in the vineries. D. Phalænopsis is doing remarkably well. Mr. Taylor is also growing Vanda cœrulea very successfully.

A house containing young plants with ornamental foliage for decorative purposes in the mansion was very interesting; especially beautiful being the choice varieties of richly-coloured Crotons.

The Vines are doing well, and producing good Grapes, but the houses require to be furnished with a more modern system of ventilation.

It was a pleasure also to see such excellent crops of

vegetables as are grown here. The early crops of Peas were over, but there was a fine crop upon Main Crop and some late varieties. Mr. Taylor thought the best main crop Pea in the collection was Prodigy; it was bearing an immense crop, and the flavour when cooked was excellent. Veitch's Main Crop was a close rival to Prodigy, and was also bearing very finely, the pods being large and well filled, and the quality excellent. Stratagem completes a trio of Peas as good as need be grown in any garden.

The Don was thought to be the best of the late Peas; that is, if there is any advantage to be derived from growing Peas that take so much longer to bring their crop up to a useful stage. I take it that quality and productiveness being equal, the sooner the crop can be produced the better. If late Peas are wanted they can be sown later, but most practical gardeners are well aware that the best late Peas are the early ones.

Having seen all that was to be seen at Brougham, and thanked Mr. Taylor for his courtesy and guidance, we proceeded to Lowther Castle. J. Panglas.

ORCHID NOTES AND GLEANINGS.

ODONTOGLOSSUM × CORADINEI VAR.

Odontoglossum × Coradinei is one of the least-prized of natural hybrid Orchids, but there occasionally tlowers a really showy variety of it which becomes greatly admired. There is the probability that most of these hybrids spring from crosses between O. Lindleyanum and the poor forms of O. crispum, and the showier are crosses between O. Lindleyanum and a finely-blotched variety of O. crispum.

An exceptionally showy flower of O. Coradinei, which seen from the front resembles a bright yellow-coloured O. × Wilekeanum, heavily blotched with red-brown, but which on turning the flower sideways displays the unmistakable long, straight column, and correspondingly elongated base to the lip, comes from the collection of A. Warburton, Esq., Haslingden, Manchester (gr., Mr. T. Lofthouse). The flower possesses a slight odour of Hawthorn, and it is possible that O. × Andersonianum (odoratum × crispuor) may have entered into its composition in place of a true O. crispum. The plant is said to bear two fine spikes from one pseudo-bulb, the one of eleven, and the other of thirteen flowers, and to be a very handsome object. J. O.B.

THE LILIES OF THE EAST.

THE reign of the imperial Lily is almost as long in duration as that of its most formidable rival, the Rose. Lilium dauricum (L. umbellatum, Hort, et Baker) a native of Siberia, begins to flower on the confines of June; its two finest varieties -so far as my own experience extends - being dauricum evectum and d. incomparabile. It belongs to the sub-genus Isolirion, which also embraces L. croceum, and other varieties; all of which are more or less attractive by reason of their bright colouring, which sometimes offers an effective contrast to contemporaneous flowers of widely different bue. Of all existing forms of this early-flowering Lily, d. incomparabile is decidedly the most impressive; it is also the most enduring, and the most floriferous. Lilium daurieum is followed in my garden by its near relative, L. croceum to which I have already alluded, but which, though widely cultivated in Scotland and Ireland, I have not grown much, other and more artistic varieties monopolising my attention. But it cannot be denied that the venerable Orange Lily has a certain beauty peculiarly its own. As long as I can remember, it has adorned our ancient churchyard, where those who are dearest to my memory repose. Thus it is often that such a flower becomes a very precious link between the fleeting Present and the irrecoverable, unalterable Past.

After Lilium croceum comes L. Thunbergianum, a very dwarf Lily, bearing the name of a great naturalist, to whom we are indebted for the introduction into

ŧ

this country of other Lilies of greater fascination, which Thunberg may be said to have been the first to popularise. Lilium Thunbergianum, however, was not one of these. Though this is a Lily of very limited growth, it produces large flowers, for the most part of an orange or deep apricot line. It has many varieties, some of which are very distinctive; but it would be a mere waste of time and mental energy to enter into an elaborate description of any of them here, for I do not regard even the best of them as remarkable acquisitions. Infinitely more beautiful is Lilium candidum, a native of the Levant, which for decorative influence has never been surpassed. It glorifies my garden throughout the greater portion of the month of July, during which period it puts all other flowers, yea, even the greatly idolised Rose, completely into the shade. L. auratum may be more gorgeous, more tropical in aspect, but it has not the pure stateliness of the fair Madonna Lily; nor is it so abiding, seldom remaining with us, in its integrity, for more than two years. Perhaps the special variety, called auratum platyphyllum, is an exception to this general rule. Lilies, I regret to say, often have a highly objectionable perfume; and L. auratum, with all its oriental splendour of aspect, is one of these. And though it may be admitted that it is not so offensive in this respect when grown in the open air, when flowering profusely in a conservatory its odour invariably imposes upon its value a serious limitation. But this is an objection which, however applicable to such Lilies as L. auratum and B. fongifforum, does not equally apply to L. Krameri, L. Browni, or -E speciosum. These therefore are admirably adapted for in-door cultivation, by reason of the rare sinoffensiveness of their odonr. But they have assuredly much loftier qualifications than this somewhat negative merit; for each of these possesses an individual beauty, always easy to recognise, but difficult to describe. Of these, L. Krameri is undoubtedly the rarest, and therefore most valuable, for the obvious reason that it has always been regarded by cultivators as the most difficult to grow. I tried its culture for several successive seasons without success. I have an idea that the somewhat diminutive bulbs of this precious Lily that I planted, perhaps, in too wet and exposed situations, speedily snecumbed to the influence of the heavy winter rains. Having obtained an extra large specimen from Mr. William Bull, of Chelsea, in November last, I planted it carefully in a sheltered, warm border (where L. speciesum in all its forms invariably luxuriates), on gently sloping ground. With this treatment, and the addition of peat to the soil, it has proved successful beyond anticipation, and will probably grow stronger every year. Another Lily of great value for gardendecoration, which I found at first considerable difficulty in thoroughly establishing, is monadelphum var. Szovitzianum, sometimes called "The Persian Lily," but really belonging to the regions of Mount Caucasus and the upland districts of Asia Minor, learned from experience that it receives most inspiration for a strong and vigorous growth from a soil very largely composed of clay; from which I infer that its native element must be of this special description, otherwise it would not refuse to develop its resources, as it did here at first, in ordinary garden-loam, which had proved eminently favourable to the growth of its companion, the graceful, buff coloured, half-Martagon, Lilium excelsum, which would be much more extensively cultivated were its merits more fully known. When L. m. var. Szovitzianum has become adequately established under the conditions I have indicated, it grows very steadfastly, increasing in strength and stature year by year. I have never seen it finer than in the picturesque gardens of Rochester Deanery, where it is much cultivated and greatly appreciated. L. Szovitzumum, which is without doubt one of the noblest of Lilies, belongs to what may be called the great Martagon sub-genus, to which pertains also that splendidly-coloured dark Lily of the west, L. pardalinum, from California, Another brilliant member of this comprehensive family is Lilium chalcedonicum, which grows so widely all over Palestine that it is, in the opinion

of Mr. Baker of Kew, Dr. Wallace, and Sir Edwin Arnold (of whom the last-mentioned writer has celebrated its beauty and intense classicality in most musical language in his *Light of the World*), the Lily immortalised in the greatest of his utterances by the "Friend of man."

Several Lilies of great interest and of recent introduction have bloomed in my garden for the first time this year, among which are L. longiflorum Takesima, of creamy-white complexion, and greater substance than Lilium l. Harrisii; and L. l. albomarginatum, whose foliage is of a striking purplish-

hotanical specimens. Mr. Buysman can supply both photographs and seeds of this remarkable plant. Ferula Asafetida was originally described by Linneus, but the best recent account is that of Boissier. Flora Orientalis, ii., 994, if, indeed, his plant be the same as that of Linneus. Our illustrations give a sufficient idea of the habit and general appearance of Mr. Buysman's plant. It is a native of Persia Afghanistan, and southern Turkestan.

Dr. Aitchison, in the "Botany of the Afghan Delimitation Commission" (*Trans. Linn. Soc.*, April, 1888, p. 69, tt. xii, to xiv.) refers to Bussier's plant

Fig. 60.- FERULA FORTIDA.
From a photograph taken in Mr. Buysman's Garden (Much reduced.)

green, distinctly margined with white. As its flowers are as large and gracefully formed as any, and its aspect more distinct, it is certain to prove a valuable acquisition. David R. Williamson.

FERULA FIETIDA.

The identification of the plant producing the drug known as Asafertida is a matter upon which some doubt is still experienced. Indeed, it is not at all unlikely that more than one species yields this disgusting, but sometimes serviceable, medicament. In the Botanical Magazine, at t. 5168, Narthex Asafertida of Falconer is figured, but this is a native of Tibet. Our present illustrations (figs. 60, 61) are taken from photographs sent us by Mr. Boysman, of Middelburg, Holland, the well-known collector and preparer of

under the head of Ferula fortida of Regel (1877), which is apparently not considered the same as Linuaus' plant (see also Aitchison, in *Pharmaceut. Jurn. and Trans.*, 1887, p. 465). If Mr. Bhysman's plant be identical with that of Regel and Aitchison, it should bear the name F. feetida, but this is a point upon which we can express no opinion, not having compared the specimens. We may, however, append Dr. Aitchison's remarks:—

Firula firtida.—" Native names: Anguza-Kema, Kurne-Kema, Khora-Kema; stems from 3 to 5 feet in height, from a perennial root-stock that produces annual radical leaves for several years, and then a flowering stem, and upon the fruit ripening the plant dies. The young flowering stem, rising from a tuft of radical leaves, appears in the form of a Cabbage, being a first wholly enclosed in the broad

stipular expansions, or bracts, to which the cauline leaves are reduced; and when the growing branches of the inflorescence first push them open, the whole plant resembles a Cauliflower. The stem seems out of all proportion, massive, pillar-like, and stout or the plant. The inflorescence is globose, and from 1 to 2 feet in circumference. The flowers are white, and the young fruit soon takes a more or less purplish tinge. In all stages of its growth every part of the plant exudes, upon abrasion, a milky juice, which is collected, and constitutes the drug of commerce called Asafœtida. The stem in a young state is exten raw or cooked,"

METHODS OF PROPAGATION.

(Continued from p. 271)

TRAINING.—As the Irish schoolmaster is reported to have said, "Thrain up a child like a tinpanny nail, when he will not only go through the worrld, but ye can clinch him o' t' other side," so may it be said of the training or education of trees of all kinds, but especially fruit trees destined to occupy walls, fruit better when horizontally trained. As an example, I will take a maiden Pear, with its three shoots springing from the graft; one of these must be tied to a stout stake to form the axis or stem of the young tree, and the others extended right and left at right angles, and at about 10 inches above the ground level. Now, all of these shoots should be ent back, when, if the tree be healthy, each eye or bud on the portion left will in due season burst into growth; those on the horizontal shoots, with the exception of the leader, being pinched back to form fruitspurs, while those on the stem are utilized to form tiers of branches. So much for theory; in practice, however, from some cause or another, all the buds do not start into growth, either on the central axis or on the laterals; and the void thus left must be filled up by the insertion of a bud or buds. Frequently some of these shoots are too vigorous, and others thin and weakly, and it requires eareful treatment to suppress the one and encourage the other, supposing the aim of the trainer to be a well-balanced tree. The terminal "break," as it is called, must be utilised to extend the tree constant temperature night and day during the ripening season-factors in successful culture in favour of which one cannot say too much, as the fruit then suffers no check, and the colour, flavour, size, and ripening are perfect.

On the other hand, the number of fruits on a cordon are counted in dozens, whereas from a fruitful horizontally-trained espalier they number hundreds, while if all be done that will allow the maximum of sunshine and air to reach the fruit, by summer pruning and thinning, the individual fruits, if not quite so large us those on cordons, will be well coloured and handsome and, as a rule, of better flavour.

There are many modifications of this method of training, as the "gridiron," in which the lowest horizontal branches are stopped and encouraged to make perpendicular shoots at right angles to them, each of which finally becoming single cerdons, and this, in my opinion, is preferable to a number of independent single cordons. Experience.

(To be continued.

APPLE MAGGOT.

The Apple-magget (Trypeta pemonella) has done a considerable amount of damage to the Apple erop this season. The adult insect resembles the common house-fly, but is somewhat smaller. It is readily recognised by its general black colour, yellowish head and legs, dark feet, prominent greenish eyes, white spots on the back and upper part of the thorax, three white bands across the abdomen of the male, and four across the abdomen of the female, and four black bands across the wings, resembling the outlines of a turkey.

The flies appear in the early part of June, and begin their attack on the Apples by puncturing holes in the fruit (so small as to be hardly visible to the naked eye), in which they lay their eggs. Egglaying continues until checked by frost in the autumn, each female being capable of laying between 300 and 400 eggs. The eggs hatch in four or five days, and the maggets begin at once to feed on the pulp of the fruit, which they will finally completely honeycomb. When the maggots mature (which, under favourable conditions, requires four or five weeks) they usually go into the ground a short distance and are transformed into pupae; although this transformation may occur in stored fruit and windfalls, and on the surface of the ground under fallen fruit or other refuse. They remain in the pupa state until the following summer, when they emerge as adult flies.

All varieties of Apples, both early and late, are subject to attack. Repression of the pest is difficult. Spraying with insecticides is of doubtful efficiency. Care in collecting and destroying windfalls and refuse under trees, and the contents of bins or store-rooms in which fruit is being kept, are efficient means of repression. Pigs and sheep running in the orchard will aid in the destruction of the larvae and puper. J. J.

Willis, Harpenden.

houses, and the margins of the paths in the kitchen or fruit garden.

This part of the gardener's art dates from very early times, as is proved by the many fine examples of horizontal training still to be found in this country in abbey and castle gardens. As much of a child's training is relegated to the schoolmaster, and too often ends when the school years are passed, so there is a growing tendency among modern gardeners to let the nurseryman do this all-important work, and trees are demanded not only fully trained, but even capable of bearing fruit the next season after purchase; but this practice is only excusable when such are needed to fill up speedily an accidental gap in a wall or in a fruit house.

It might even be said that every gardener should knew how to start and train from a "maiden" tree. i.e., a tree one year old from the bud or graft, and most practical gardeners prefer to do so.

Experience shows that the best form for training an Apple or a Pear which is to occupy a place on a wall, fence, or to grow as an espalier by the sides of walks, is the so-ealled horizontal, while all stone fruits generally do best as partly vertical or fanshaped trees, but no hard-and-fast line can be drawn here, for while Morello Cherries do best as "fans," the Duke Cherries-more especially the Bigarreaus-are

laterally and upwards, so as to fill the required space the after-treatment being within the capability of most gardeners. If the trees are trained as espaliers, their training is precisely the same as if they stood against a wall; but, in this case, I would impress upon the reader the use of creesoted, stout stakes, or failing these, of oaken uprights, to form the fencefor although galvanised fencing-wire is handy and neat for this purpose, and fover uprights are required, I do not like it, and what is of more moment, I am quite sure that the trees do not, as it is to rigid, as well as cold. Take care to leave 1 to 1 feet space between the tiers of branches, or when the fruitingspurs are formed they will be too crowded, with the result that the wood will not ripen, and little or no fruit will form. Cordons are but a modification of this method, and the name comes from a French word. meaning girdle or band; but let the grower of such trees think for a moment that if he grew a dozen vertical or oblique cordons on a given wall-space, which would accommodate but one espalier, there will be instead of one a dozen trees, taking the nutriment out of the soil of the border. I admit that the finest fruit may be gathered from cerdons trained along within a foot of the surface of the ground; but this is due to skilful treatment, and the radiated heat from the soil, which helps to keep an almost

FERN BUDS AND BULBILS.

As one of the commonest and best known trade Ferns is Asplemum bulbiferum, which produces a multitude of young plants upon its fronds, a word or two on such buls should be of interest to many readers of the Gardeners' thronicle. At the outset, one is struck by the peculiarity of a plant producing its young as this Fern does, from a number of apparent pimples on the very face of the foliage, instead of from buds generated in the axils of the frond divisions. With trees and shrubs, as most people know, there is a bud, latent or patent, snugly ensconced between the base of the leaf-stulk and the twig from which it protrudes; but where is the tree or shrub the leaves of which after developing with a normally smooth surface, breaks out into a rash of youngsters? who, moreover, while still parasitical upon the motherplant, are capable of breaking out into a second rash on their own account, so that actually two generations may be pendent from the fronds of the original Fern-

This remarkable fecundity is indeed the secret of its trade popularity, since a strong old plant yields an annual harvest of sturdy offspring, which only need picking off and inserting in soil to start manufacturing on their own account right away. In this case, and that of a number of kindred species of the same genus, the little plants remain normally dependent upon the parent frond until it decays, which being borne to the ground by the weight of its progeny, gives them an opportunity of rooting and becoming independent. Woodwardin orientalis, however, another Fern which is less common than it should be, since it is nearly hardy, while producing youngsters much more freely, the upper surface being absolutely crowded with them under favourable circumstances, has apparently different views upon the subject of their support, and after providing them with two or three oval fronds, arranged parachute fashion, shakes them off upon a favourable breeze, to shift for themselves; the least shock, at any rate, suffices to detach them, and it is very interesting to watch them descend and settle the right side up upon the ground, where, if the soil be moist and open, they readily root and establish themselves. A near relative of this-Woodwardia radicans, which bears grand pendulous fronds 7 feet long, produces one or sometimes two buds upon the midrib, near the tip of the fronds, these are, however, firmly attached, and develop into fairly large plants with fronds, it may be a foot long, and a bunch of short aërial roots at the point of junction as large as a Walnut. Their weight naturally tends to depress the already pendulous mother frond, so that a plant growing on a slope would gradually find its way, step by step, to the bottom. The so-called "Walking Fern" of America, Comptosorus rhyzophylla, a near ally of our common Hart's tongue, acts in a very similar fashion. This is a small, slender-fronded Fern, the fronds of which grow out at the tip into long, slender projections by continuance of growth of the midrib; a terminal bud is then produced, which as it develops weighs down the tip until it reaches the soil, where it roots and takes another stride. Obviously a provision of this sort, which deposits the offspring well outside the root-range of the parent, gives such Ferns an advantage over those which only propagate (the spores, of course, being left out of the question) by offsets or fission of the crowns. It is not therefore surprising that we find in many species provision of this sort. The Ostrich Feather Fern (Struthropteris), for instance, arrives at the same result but in a different fashion. This Fern is a true Shuttlecock Fern, i.e., the fronds spring up symmetrically in a circle, and stand erect, like the feathers of the popular toy, and each frond terminating with a feathery non-proliferous tip, the analogy we have cited seems appropriate. If, however, we instal one of these Ferns in our rockery, which, as it is perfectly hardy, we may do with advantage, we shall probably be surprised ere long by finding another, and then another, a yard or so away, each a well-defined shuttlecock, and apparently altogether independent of the others. Digging one up, however, we shall find that lateral underground buds have developed long runners or stolons, like subterranean Strawberry runners, and thus these, when they reach a favourable position, develop the shuttlecock, and so spread the Fern far and wide. A very familiar example among exotic Ferns is the Nephrolepis family, which, in suspended baskets, throw out these runners in great profusion into the air in a vain quest for fresh fields and pastures new. Bring them in contact with soil, and they start at once producing the apparently interminable fronds of the species. Apropos of this, many years ago a friend gave the writer a small plant of Nephrolepis exaltata, then a stranger to him. It was carfully placed in a Wardian case, and fronds speedily began to rise and uncoil-in a short time they reached the roof; fortunately there was a ventilating slit through which they could be conducted week after week. They continued to unrol without any apparent diminution pointing to a coming finish, and at this stage, in ignorance of its real name, we christened it Firescapia neverendingia, which certainly

fits it exactly. Stoloniferous Ferns of this class lead on, of course, to those producing rhizomes generally; but the essential difference between these is, that a rhizome proper yields its fronds one by one at intervals, which the stolon does not do.

Buds or bulbils upon the fronds are found in numerous species other than those already cited, and more often on abnormal forms than on normal ones. Polystichum angulare proliferum is a well-known trade Fern. This has ionumerable bulbils produced in the axils of its subdivisions on the primary and secondary midribs; and fronds so characterised only need pegging down on open soil, and kept close, to yield plants freely. Some varieties of Hart's tongue, notably Scolopendrium var. cristatum. O'Kell, bear little plants on their fronds or stalks; and of our other native species, Lastrea montana, Athyrium filix-formina. Asplenium ruta muraria, the rare A. refractum, Osmunda regalis, Trichomanes radicans, and Adiantum capillus-veneris have afforded examples. Among exotics, the curious Cystopteris bulbifera is unique in producing large egg-shaped bulbs rather than balbils on the backs of its fronds, which fall to the ground and produce full-sized plants so quickly as to render it a weed. It has been found, however, that some Ferns possess the power of producing buds under particular treatment even in cases where no possibility of a latent bud exists. In many Ferns, such as the Male Fern (Lastrea filix-mas), it has been shown that at a certain point in the base of each frond there is normally such a modification of the cellgrowth as constitutes the nucleus of a bud, and that if anything happens to check the development of the normal axis of growth in the centre of the erown, the root energy finds a vent through these lateral buds which grow and produce a number of young plants: the old crown probably perishing. It has been demonstrated, however, especially in the case of the Hart's-tongue, that any portion of its caudex including the bases of the fronds themselves will produce buds, and eventually plants if severed and carefully cultivated. Careful examination of such sections will show that the buds are produced quite indiscriminately from any part of the surface, cut or uncut, while Lastrea bases so treated will only yield a plant if the one latent bud be unharmed. Some species of Marattia have yielded plants in like manner from the fleshy scales on the base of the fronds. In Athyrinm filix-formina each frond at its extreme base would appear to have one or more latent buds, since, if properly treated, plants can be obtained therefrom, as we have repeatedly proved.

As will have been noted from the foregoing, bulbils are generally produced on the upper surface of the fronds. An exotic Lastrea, L. prolifera, however, has them associated with the spore-heaps, i.e., on the back of the fronds, and this same phenomenon has been remarked in several of the plumose forms of our native Lady Fern (A. f.formina). Curiously enough, the plumose or extrafeathery character of most Ferns is accompanied by comparative barrenness, the extra leafage being at the expense of the reproductive powers, and in the cases cited spores are produced comparatively sparingly. Notwithstanding this, and the fact that the spores are perfect, producing plants quite freely, the transformation of energy not only produces the extra leafiness in question, but partially transmutes the very spore-heaps themselves, so that in the midst of them emerald-green growths appear which uncoil under favourable conditions into little fronds, and can, with great care, be cultivated into independent plants. As these only appear very late in the season, in fact, just before the mother fronds die down for the winter, the babies are orphaned almost before they are born, and the nurse must be clever who rears them. Precisely the same peculiar character has been observed in two distinct varieties of our English Maidenhair (Adiantum eapellus-veneris), viz., Daphnites and imbricatum. Both these are distinctly plumose forms of the species, the latter especially, which does its best to rival A. Farleyense in its own line plus a greater density of growth. In both these varieties tiny plants make their appearance under the rolled back edges of the pinnæ, and

in conjunction with the spores, which are also produced sparingly. A form of the Bristle Fern, Trichomanes radicans, bears little plants on the upper surface, precisely like Asplenium bulbiferum. Buds and bulbils, it has been found, are not confined to Ferns, as we generally know them, but are even preduced in the prothallus stage. Professor Farlow first discovered apogamy, by which Ferns are re-produced from the prethallus without sexual action through buds; and I have recently discovered a curiously clear example of this in one of my sowings, in which a half-dead prothallus developed two long horns, each of which bore a bulbil proper near its tip. There is no doubt that adventitious buds are often produced owing to the parent frond being damaged in a young state, so that the root-energy finds an outlet for itself by generating a bud, and eventually a plant. In the frilled section of Hart's-tongues - S. v. crispum-they quite frequently appear on the stalks, and even the surface of malformed fronds, though we have never found them on perfect ones. Many exotic Ferns are proliferous in various ways, but we think the propagator has much to learn regarding the formation of induce,, buds on the lines above described; and I think, therefore, my article will be of interest as indicating an almost unworked line of research. Chas. T. Druery, F.L.S., F.R.H.S.

NOTES ON THE OUT-DOOR PEACH-CROP.

The Peach season of 1896 has generally been a very good one, and the crops have been unusually heavy. Owing to the extreme heat and drought the fruits have been rather under sized, but this has not been the case where water has been moderately afforded, together with a mulching of stable-mannre covering a space of 3 to 4 feet from the walls. Several remarkably early dates have been chronicled of the gathering of ripe out-door Peaches this year, and so far as my experience goes the record has been beaten in this respect. Ripe Peaches from out-of-doors in the month of June have been very rare, but in many places in the south such fruits have been had this year.

The earliest varieties are Waterloo and Alexander, and although there is very little difference in them, it is in favour of the former. It is earlier, and has a rather better flavour and colour. A few fruits of this variety ripened here (South Bucks) in June, and in the first week of July good dishes were gathered. Amsden June is another fine early Peach, ripening about ten days later than the two preceding varieties. Condor is a Peach of excellent flivour; it attains a good average size and colour, and ripens about three weeks later than Waterloo. It is superior in flavour to Hale's Early, a free-bearing Peach that ripens about the same time. Early Silver follows the preceding very closely, and is a pale-coloured Peach of very good flavour. As a further succession we have Grosse Mignonne, Bellegarde, and Dymond, three excellent varieties. The latter is one of the best either for outdoor culture or under glass, the fruit of large size, a dark-red in colour, and flavour capital, in this respect equalling Noblesse. This variety should not be omitted from the smallest collections, it being a good grower and of a hardy constitution, and of fine flavour, Royal George is a good old Peach, but it is sometimes subject to mildew. Dymond I consider a better Peach, and should plant it in preference to the old variety. Crimson Galande ripens freely on the south and west walls rather earlier than Royal George. The fruit is of medium size, and bright colour; but in flavour it is not equal to that of the four preceding varieties. Late varieties of Peaches have ripened earlier than desired this year. Barrington, a good September Peach, which usually ripens towards the end of the month, ripened fruits on a west wall during the first week; and Walburton Admirable, the best-flavoured late Peach I am acquainted with, will be over, apparently, a fortnight earlier than was the ease last year. The Nectarine Peach is also a good late variety; the fruits are of extra size when well grown, and although it does not crop so freely as most of the varieties enumerated, it is useful by reason of its late ripeuing, size, and good quality. The above varieties are ont-door Peaches, that may be relied upon as sure croppers in any ordinarily good season; and all excepting the very late ones may be grown successfully on west walls in the south and midland counties of Eugland, unless the situation be nausually low-lying and wet. C. H.

FORESTRY.

PRUNING TIMBER TREES.

THE amount of pruning performed on forest trees usually has to be regulated in accordance with the staff of forest labour employed, and the object the owner has in view. The fact that pruning is necessary or desirable is a proof that the previous management of the plantation has not been quite as it should have been, for, when properly humoured and directed, Nature performs most of this kind of work. In Fir woods generally, and those consisting of shade-bearing hard woo is, close order from the start, and a slight irregularity in the size and vigour of the trees, will always ensure a crop of clean stems without much loss from overcrowding. But in light-demanding species, close order for any length of time invariably means a reduction in the number of well-shaped stems; and thinning, if not affected artificially, will, soouer or later, occur by the dying out of weak individuals. The result of this is a certain degree of freedom in the growth of the crowns of those remaining, which frequently exceeds that necessary for the proper development of the stems. In such cases pruning may be beneficial in several directions. although the age of the trees, and the value of their timber, determine the return which may be expected from the work.

In ordinary plantations, pruning is usually confined to the removal of dead branches and double When a branch loses its vitality, tho growth of the cumbin a proceeds but a short distance beyond the junction between the brauch and main stem. The point at which this growth ceases gradually becomes more apparent, owing to the increase in the circumference of the living portion taking place more rapidly than that of the main stem, by reason of reduced bark pressure and the accumulation of organised sap at this point. As growth proceeds, fresh layers of the new wood are pushed out along the dead branch, notil the latter decays or is blown off, when the exposed end of the stem gradually becomes "occluded" or covered by layers of live wood. The most favourable result of this process is a dead knot, the formation of which begins upon the death of a branch, and finishes when its stump is covered by new growth, and is the almost invariable result of the death of a small branch. When large branches die and remain ou the tree for many years, more serious defects, however, often arise in the timber. Such branches retain a good deal of moisture, and their sapwool quickly becomes infested by saprophytic fungi, which considerably hasten their decay. With species having no true heartwood, such as Beech, Ash, and Sycamore, or in which the heartwood po sesses little durability, as in the Elm, the mycelia of these fungi frequently penetrate not only into the interior of the branch, but also through them into the main stem, and may cause its entire decay. With a durable heartwood as in the Oak. the centre of the branch usually resists infection, and the gradual process of seasoning to which it is subjected endows it with a bone-like hardness and degree of durability which renders it almost imperishable. In such a case, infection of the main stem is less likely to occur, for as the sapwood at the base of the branch becomes soft and rotten, the new layers of the surrounding wood push their way down to the ceutre of heartwood, after which the formation of a dead knot of sound wood is alone possible. From the above, the desirability of removing dead branches over 3 or 4 inches in diameter, at an early stage in their decay, will be apparent, but when we come to those still living, the consideration of several points over and above those already mentioned is involved. It is

always a difficult matter to say what proportion of branches is really necessary for carrying on the assimilative functions which result in a properly-nourished timber stem. If the greatest possible quantity of wood were the object in view, the more branches the better, but as everyone knows, wood is not necessarily timber. The motto of the economic forester should be "First make your stem, and then cover it with timber."

When worked out, this means that branches are necessary evils until the tree has almost attained its complete height, after which, the more the better, providing they contribute to the thickening of the stem. A branch can only be said to do this when its leaves receive sufficient air and light to convert the raw material they receive from soil and atmosphere into organic compounds in excess of the requirements of that particular branch. Failing this, it does more harm than good by throwing a greater burden upon the absorptive powers of the roots and the waterconducting channels of the stem. It is in the removal of such branches that stem-pruning proves beneficial; and we may regard it as a safe proceeding to take off all branches which are placed below the maximum breadth of the crown, or which are entirely shaded by those above them. This, of course, only applies to plantation trees, which receive the whole of their light from above, and where the side light is too dim to be of much value. The intensity of light necessary for the formation of starch in the leaf probably varies with the nature of the soil and the supply of potashsalts, but for practical purposes this may be left out of account as regards pruning. In any case, pruning is only justifiable on economic grounds when carried out on a small proportion of well-formed stems intended for the production of large timber, being too costly and dangerous an operation for general practice. A. C. Forbes.

TRENT PARK.

This is the name of the residence of F. A. Bevan Esq., which is situated in Hertfordshire, not far distant from the town of Barnet. The gardens, which are of considerable extent, are under the care of Mr. Lees, of Chrysanthemum fame. In recent years many alterations and improvements have been carried out under his direction in the flower and pleasuregrounds, which form some excellent features; and noticeable in this way are some beds of new and rare shrubs which have been made in the vicioity of the mansion. The bedding out, as seen on the terraces, is bold in character and at the same time effective, and without formulity. The keeping of this part of the gardens was excellent, everything being neat and clear, and the gravel walks noticeable for their firmuess and dryness.

The kitchen garden is well cropped with first-class vegetables. The wills are covered with fruit trees faultlessly trained, and those of Pears, Plums, and especially Peaches and Apricots, were bearing good crops of very fine fruits. The crop of Apples is a heavy one, and the fruits are very well coloured, although they are not of large size. Many borders for the growth of flowers are found in the kitchen gardon, and one of mixed bardy herbaceous percunia's was rich in species and varieties. Other borders contained Roses in variety, Carnations and Violets; the last-named plants are in some cases grown in these borders for winter flowering, and they are already fit for being lift d and placed in the frames. Here also was found a collection of Muchaelmas Daisies of remarkable extent and variety.

The many glass structures existing contain Peaches, Vines, and Figs. A houseful of Muscat of Alexandria Grapes consisted of very superior bunches, large in berry, well finished, and of that beautiful goldenyellow which bespeaks high culture. Some of the planthouses contained collections of Crotons, Palms, and many other plants used in the dwelling and for table decoration, all of which were in excellent condition. There are two houses filled with Carnations, mostly Souvenir de la Malmaison, the plants well grown and robust, and of which Mr. Less is justly proud.

Several houses are devoted to Orchid culture, a good collection of these plants being grown, many of which were in bloom. I should suppose that Odonto-glossum crispum is the favourite species, and the numerous examples of it were in fine condition.

There are other houses and pits, which contained Melons, Cucumbers, Torn thos, and a large quantity of winter-blooming plants, such as Cyclameus, Prinnalas, Bouvardias, &c. Strawberries in pots receive considerable attention, and they were about the best I have ever seeu.

The Chrysanthemums, so largely grown here, are marvellous examples of good culture, with spotless foliage, and all "the bods taken." The pots are crammed with roots, which will carry the plants on well throughout the flowering season. The collection is complete as regards every new variety in all the various sections, and Mr. Lees should be able to make a good show on the exhibition-tables this season. J. W. McHattir, Strathfieldsaye, Mortimer.

FLORISTS' FLOWERS.

SEASONABLE NOTES ON CHRYSANTHEMUMS.

DUBING rainy weather Chrysanthemums should be supplied with stimulating plant food, but owing to the soil being always in a moist state, it is not possible, even were it necessary, to apply this aid to growth in the form of liquid manure. Some persons are under the impression that Chrysanthemum plants grown for the production of large blooms cannot have too much moisture at the roots. This is a fallacy, and likely to mislead the inexperienced cultivator. Stagnant root-action is one of the cruses of defoliated stems, and lack of moisture is another. After a spell of wet weather it is no uncommon sight to find the lower leaves, in fact for 2 feet up the stem, suddenly turn black, and the off later without apparent cause. In my opinion, this is a result of stagnation of rootgrowth, mainly caused by a too moist state of the soil. The best method of applying nutriment during wet weather is to sprinkle it on the surface of the soil, at the rate of one terspoonful to each plant, For this purpose Thomon's, Ichthemic guano, Clay's, and Standen's manures are suitable ones to use. Fresh and dry hen or pigeon droppings make a capital manure, and by rubbing them through a fine-meshed wire sieve, the particles are fine enough to be quickly washed into the soil. The safer way of employing all such manures is, little and often. Soot is a valuable manure, containing, as it does, a quantity of sulphate and chloride of ammonia. A dressing of soot will perhaps, restore chlorophyll to the leaves when it is deficient, more quickly than anything else. Although lime is required by the Chrysanthemum, yet it must be carefully used, as too much causes loss of colour in the foliage; and the same effects are noticed when water from off the chalk is employed. The foliage turns of a pale yellowish tint, and a dressing of soot counteracts this. Around Liverpool, where the Chrysanthemum has long been admirably cultivated, soot is in great favour. As a rule, though soot is all the better when used mixed with water, it is preferable to use it as a top-dressing in longcontinued wet weather.

At about this season, the last top dressing of soil mixed with some kind of fertiliser should be afforded. One important point in producing large blooms is the encouragement of the surface roots, for no Chrysanthemum plant was ever furnished with too many of these, for the more there are, the greater the amount of food taken up by the plant. By adding a surface dressing an meh thick consisting of two parts loam and one of manure, artificial or otherwise, the roots that are near the surface are eucouraged to increase in number and length, and remain there. After the dressing is finished, lay a large crock or tile on the surface to receive the water as it comes from the spout of the watering-call. The crock has, moreover, the advantage of encouraging the growth of the roots at the surface, as may be seen by lifting it a short time after the top-dressing has been put on.

Earwigs are extremely numerous this season, and the traps set for them should be examined daily, and the insects destroyed. Earwigs injure the blooms later on, it is therefore wise to lessen their number as much as possible before the plants are housed.

I note the presence of mildew on the under surface of the leaves, as is commonly the case after a hot and dry summer. Some varieties are much more susceptible to mildew attacks than others, and especially where the attention given to watering the plants has not been of that regular order consistent with good management. Princess Teck and the members of that family are perhaps more liable to have mildewed leaves than any other variety. Some remedies should be applied without delay; and flowers-of-sulphur is one of the best of these. E. Molyneux.

THE BOTANICAL GARDENS, EDGBASTON, BIRMINGHAM.

THE drought has been felt as severely in the Birmingham districts as in those further south, and it might be said, pre-eminently so on the undulating banks of the Birmingham Botanical Gardens, and yet, though the turf and some other things showed signs of the het, dry snmmer, the grounds had a bright and fresh appearance at the end of July, and were gay with flowers, evidences of careful attention on the part of Mr. W. G. Latham. The newly-planted alpine and bog-garden is fast becoming well-furnished with verdore in spite of the drought, which had almost entirely dried up the marshy spots where the aquatic plants find a home. The hose and the watering-pot had done their utmost to master the drought, but at the expense of considerable time and labour. The terrace flower-garden and that upon the extensive slope which falls away from the terrace towards the grounds on the lower level, was surprisingly gay and effective, though the position is a very trying one for plants in such a dry summer. Panels of zonal Pelargoniums were in full bloom, while Centaurea ragusina, Violas, a dwarf blue Ageratum, Koniga variegata, yellow-flowered Calceolarias, Pyrethrum Golden Feather, &c., made out the pattern. It is necessary to look upon this gailydecorated slope from below to appreciate its effectiveness. Borders of perennial plants are well furnished, many an interesting genus being represented; and by the sides of winding walks, the visitor comes upon large beds of what Mr. Latham grows as Chrysanthemmi maximum, but it is early to bloom, and answers to the description of Chrysanthemum lacustre of botanists. There were bold and striking beds of Coreopsis grandiflora and other subjects, such beds being in good keeping with the masses of foliage on either side. Everywhere the grounds are in excellent order; and while the claims of botanical science are by no means overlooked, the popular taste is also considered and catered for. The residents in Edgbaston have a delightful promenade in the grounds of the Botanical Gardens,

The houses are always in perfect order, and the plants in the best condition. In the show-house Fuchsias are largely employed to secure appropriate decorative effects; the named varieties are there in abundance, and also such species as corymbiflora, and triphylla, always very attractive subjects here during the summer, and others. In one of the show-houses could be seen a very fine strain of Gloxinias, and an e pally good one of Begonias was coming on to take their place. There is a wide selection of plants, not a few being such as are seldom met with, and the presence of which forms an additional attraction to those interested in plants. In the open air, growing in front of the plant-houses, could be seen bushes of Oleuria Haastii laden with blossom. R. D.

GERMAN AMBER. The production of German amber in 1894 amounted to about 4,400 centures (220 tons), or about 1,000 centures (50 tons), more than in the previous year. By far the larger portion of the above quantity is put out by the two mines of Palmuicken and Kiantepellen, belonging to the firm of Siantien & Becker; while the smaller portion of about 120 centures (6 tons) only is obtained by dredging and searching the foreshore of the Baltic Sea. The two mines named above, with the home industry, employ about 1200 persons. **Jour. Noc. Arts.

BOOK NOTICE.

AMERICAN GRAPE-GROWING AND WINE-MAKING.
By George Haussmann. (Published by Orange Judd Company, New York.)

WE have here what seems to be a very practical treatise on the Grape-vine as grown in America, and which we think will prove of considerable interest and value to these concerned in the cultivation of Ameriean Grapes. Comparatively it is of little value to growers in this country. In the first place, Grape culture in America is almost all carried on in the open air. In California and the Southern States they ripen thoroughly, and are not unpalatable when one gets accustomed to the fexy taste of the native Grapes. As elsewhere, great improvements are being made, innumerable new hybrid varieties being introduced every year. The great merit of the American Grapes is their hardiness and rebust constitution, and their suitability to the climate, whilst the European Grapes are found not to succeed. That which will probably prove of the greatest interest to English growers are the chapters referring to the diseases and insect enemies of the Vine. It is to be remembered that to America we are indebted for the introduction of the Phylloxera, the direst scourge that has ever appeared amongst Grape vines, cansing wholesale destruction in European vineyards and elsewhere. It is somewhat remarkable that the country which should send us the "arch-destroyer" should also furnish us with its master. The success attending the grafting of the European Vines on the American Vine (Vitis riparia) is most gratifying, an immense trade having been created in the manufacture (so to say) of phylloxeraproof stocks that is simply astennding.

The fungoid diseases, Anthracnose and Black-rot. which threatened at one time to annihilate Grape culture in some of the States, and which, we fear, is paying some of our growers in this country an nuwelcome visit just now, had better take note that "Mr. Haussmann says these may be kept in check by repeated sprayings of the Bordeaux Mixture. The great ignorance displayed, and the strange objectious made to these sprayings, is well teld by the following :- 'A neighbour of ours postponed his spraying because the incessant rains would be sure to wash off the solution.' 'Another neighbour argued that spraying was useless until dry weather set in, because the rains would wash away all rot and mildew from the fruit," Just such mistakes as these are to blame for all failures in spraying Grape-vines, for where fruit and foliage were covered with a copper solution, the germination of the spores of this fungus is impossible. "When by the naked eye we can discover the least trace of mildew or rot, it proves that we should have commenced spraying at least ten days before.

A good portion of the work is devoted to winemaking, as to the merits of which we can pass no opinio;; but we are astonished at the enormous extent to which this industry is carried, especially in California.

In the chapter on raisin-making, the author falls into the common error of stating that the Sultana Grape is a distinct seedless Grape; whereas it is but the badly-set berries, the thinnings, in fact, of the Muscat of Alexandria—the best fruit on the stalks making the finer raisins, and the seedless berries the Sultanas.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By C. Herrin, Gardener, Dropmore, Maidenhead.

Cabbage.—If the ground for this crop has not already been prepared, the work should be done at once : and if the crop of spring-sown Onions has sufficiently matured for removal, the land on which they have grown will answer well : and if it was well manured for the Onions, very little preparation will now be necessary. After cleaning the piece from weeds, &c., scatter thinly over the surface a dressing of lime and soot.—If the Onion-quarter be not

now at liberty, and Cabbage must follow another crop [which should not be Cauliflowers, but may be Potatos], a moderate dressing of half-rotten manure should be dug in, and a surface-dressing of quick-lime and seotafforded, the ground being trampled evenly all over so as to make it firm before any planting is done. Plant the Cabbages with balls of earth attached, in drills made about 3 inches deep, planting with a trowel. Those from the earliest sowning, which have already been once transplanted into nursery beds, will now be ready for the final planting, and if the varieties are small-growing, such as Ellam's Dwarf and Little Pixie, they may be planted at 9 inches apart in drills, at 18 inches apart, which will leave them, when each alternate plant is pulled up for consumption in the winter, or as soon as they crowd the permanent plants at 18 inches apart. Varieties of larger growth should be so planted that ultimately they will stand at 2 feet apart each way. A good portion of ground should be reserved for plants from the later sewing.

Celery.—The earthing-up of Celery should be done in dry weather, as opportunity offers. It is an error in cultivation to earth-up Celery too freely at one time, and it is preferable that it be rather under than overdone at the present time. If done too freely further growth may be hindered, and if the hearts be smothered, the heads are often burst or become otherwise deformed. Where nice clean sticks are required for exhibition, bands of brown paper should be placed round the stems before the soil is placed around them, but first sprinkling a little soot about the surface as a preventive of disfigurement by slugs. If Celery be required for use early in the coming month, this shend new be given a final earthing-up, and if not treated as above with bands of paper, the stems should either be tied loosely with a strip of matting, or be held together by a second person to prevent the soil getting into the hearts of the plants.

Parsley is now plentiful in most gardens; and where this is the ease, remove all of the outer leaves from a portion of the plants, and thin out any plants standing thickly together so as to induce a sturdy growth that will survive the winter. Where small boxes have been filled with roots, place them in the most exposed position available.

Mushrooms. — The collection of manure for the formation of beds should be carried on daily. It is necessary that it be wheeled into an open shed out of the reach of rain, and frequently turned until the rank heat and steam have been dissipated, and the necessary degree of dryness obtained.

PLANTS UNDER GLASS.

By JNO. McINTURE, Gardener, Woodside, Darlington.

Thoroughly cleanse all structures required for housing Chrysanthemums or other plants that have stood out of doors during the summer months. Should frost occur suddenly, the plants will have to be taken up hurriedly.

Zonal Pelaryoniums.—A good batch of cuttings should be taken for furnishing plants for next season. Insert these singly in thumb-pots, and place them in a cold frame, the lights of which need only be placed over them during wet weather, or on cold nights. Ivy-leaved varieties have nearly finished flowering; and if they are to be kept for another year, do not give them much water. The better plan is to raise young stock annually, and discard the old plants. Take entitings of varieties of the Regal type from well-ripened plants. Old plants which have finished flowering may be stacked on their sides out-of-doors, where they will mature. Spring-struck plants now blooming may be afforded an occasional dose of liquid-manure.

Cyclamens.—Sow seed during the present month, taking especial care that it has been obtained from a good strain. Use shallow pans, and a compost of leaf-soil and loam. Until the seed germinates keep the compost always moist. A position upon a shelf near the glass, but well shaded, in an intermediate temperature, is the best suited for them for some time to come.

Climbing Plants upon the roofs of conservatories or other houses, now require to be well thinned and regulated, so that all the light possible may pass through them during the winter.

circenhouse Rhododendrons, and other hard-wooded greenhouse plants standing out-of-doors, should be trained into shape. If the plants are rootbound, assist them occasionally with soot-water. All plants should now be put in realiness, as they must be housed on the first signs of frost.

The Fernery.—If fire-heat has been dispensed with during the hot weather, it will be necessary now to again use a little to prevent the temperatures becoming too low. Continue to feed large specimens that are root-bound with farm-yard liquid or soot-water. The house should be looked over daily, and all decaying fronds removed from the plants, and any plants showing signs of resting should be removed into another house where they may be given less water. Adiantums are sometimes grown in batches for enting from and for general decoration. If a young stock of the plants is now in 3-inch pots, they should be moved into 5-inch ones. Use peat and good loam in equal parts, with the addition of some silver-sand.

Anthurium Scherzerianum. These plants are over for the season, and may be re-potted. A compost consisting of peat, sphagnum-moss, and charcoal in small pieces is the best for them. If the spathes be now removed, and the plants repotted, they may be kept growing all through the winter. A. Andreanum quickly becomes leggy and unsightly; take off the tops therefore from a few of the aerial roots from any such plants, and insert them in 4-inch pots in sphagnum-moss and peat; put these in the propagating-box for a time, and good useful plants may be had for next season's blooming. Cut the old shoots well back, and they will then make several breaks. The plants may thus be grown on until the spring, when the shoots may be removed for propagating.

THE ORCHID HOUSES.

By W. H. White, Orchid Grower, Burford, Darking.

Miscellaneous Species .- Where a large number of Odontoglossums are grown, a great deal of time during the next few weeks will be spent in re-potting or re-surfacing the plants, but there are other Orchids which must on no account be neglected. The Dendrobiums must be frequently looked over, and any plants that have fully completed their growths should be at once removed to a lighter house and cooler temperature. An atmosphere conducive to growth must still be afforded such late growing species as D. Dalsuit be anorded such rate-growing species as P. Pal-honsieianum, D. Bensonie, D. Brymerianum, D. Parishii, D. albo-sanguineum, D. Lowii, D. fimbria-tum, D. elavatum, D. Dearei, D. sanguinolentum, &c. Some plants of Phakenopsis Schilleriana, P. Aphro-dite, P. leucorrhoda, and P. casta will have now finished making their leaves, and great care must be exercised in affording water to them so as not to be exercised in anothing water to them so as not to saturate the sphagnum-moss, which at this season, if heavily watered, takes a long time to dry. The green-leaved varieties, as P. violacea, P. Ludde-manniana, P. Marie, P. tetraspis, P. corun-cervi, P. speciosa, and P. Micholitzi all do best in a rather damp and shady position. At this season of the year a gummy exudation may sometimes be seen on the under sides of the leaves of Phahenopsis, especially those of the darker-leaved kinds. The plants should be examined each time they are watered, and if any exudation is observable, it should be immediately removed. Oneidium Lanceanum is a splendid late-blooming Orchid, and one that is usually given a stove temperature. Plants that are now making no growth should be kept somewhat drier at the root, particularly if they are potted in the ordinary way; but so long as the roots continue to grow, the atmosphere should be kept fairly moist. Plants upon blocks must be very carefully afforded water, and no water should be allowed to touch the rhizomes or the base of the leaves, as these are liable to decay from this cause. Oncidium hæmatochilmm now developing its flower-spikes will require the same kind of treatment as O. Lanceanum,

Cattleya house specimens of Platyclinis Cobbiana that are in full growth, and producing their spikes, will require abundance of water at the root until growth is finished. P. glumacea, P. uncata, and P. filiformis, being at rest are perfectly safe in this house until growth recommences. Epidendrum Stamfordianum and E. Frederici Guilielmi are both very desirable Orchids for exhibition purposes, but unfortunately they are generally difficult to cultivate. Their principal requirements are intermediate bouse temperature, and an abundance of water during the season of growth. To ensure strong-flowering pseudobulbs, the plants should now be placed well up to the roof-glass. Both species may now be repotted, if necessary. Newly imported plants of the pretty E. Engress should be carefully looked after; it being a species Newly-imported plants of the pretty E. Endresi worth every attention. It will thrive luxuriantly in small shallow pans suspended to the roof of the intermediate house, in a moist sharly position. All the tall-growing Epidendrums, as E. O'Brienianum, E. xanthinum, E. myrianthum. E. elongatum, E. evectum, and E. arachnoglossum, are now producing their flowering-stems, and should be periodically examined for scale and mealy-bug. Flowering plants of Vanda corula should be placed where they may obtain plenty of light, and be kept fairly moist at the root till their flowers open.

FRUITS UNDER GLASS.

By W. Pope, Gardener, Highelere Castle, Newbury.

Melons. - Great care will now be required in attording water to plants whose fruits have attained to nearly their full size, as an excess of moisture at the root or much humidity in the air may result in the fruits splitting before they ripen. Afford, therefore, a constant small amount of air day and night, and a temperature of 70 to 75, letting it mount to 90° or 95° when the sun shines, with a corresponding increase in the ventilation. Should canker attack the stems, rnb quick-lime into the affected parts once or oftener. Melons should always be cut from the bine before they are quite ripe, that is, as soon as a fissure appears round the stulk, placing them in a light, moderately airy fruit room, where they will keep a longer time in good condition, and the flavour improve. The latest batch of plants should now have their fruits set, and be afforded a temperature of 70 to 75 by day with as much ventilation as will avert any stagnation of the air of the honse. As the fruits grow in size close early in the afternoon, sunheat being better for the plants than that obtained from the hotwater-pipes. Use the syringe sparingly, damping the foliage only on bright afternoons; sufficient air moisture being obtained by sprinkling the floor, walls, and other available surfaces in the mornings and at closing time. When water at the roots is really needed by the plants, a sufficient quantity should be afforded as will wet the bed to its entire depth, and occasionally weak, warm liquid-manure, or a small quantity of guano sprinkled on the bed once or twice a week; or, failing this, the Melon-bed may be topdressed with fresh horse-dung. Melons growing in dning-pits and frames will need especial attention, and if the crops are approaching ripeness, apply water at the roots in just sufficient quantity to prevent the flagging of the leaves, wetting the foliage as little as Renew the dung linings if the possible in so doing. heat is declining, so that air may be constantly admitted, and the flavour of the fruits thereby improved. Keep the foliage thin, and bring the fruits up to the light; and now that the nights are colder, the frames should be covered with mats.

Parles and Nectoriuss.—The late varieties, Sea Eagle, Walburton Admirable, and Stanwick Elruge, will now be ripening their fruits, and should, like the Melons, have a free circulation of air, sun-heat being utilised as much as possible, the thermometer being allowed to reach 80 or 85 before more air is afforded. Under this sort of treatment the fruit and wood ripens better than when the heating apparatus is used. The border in which these varieties are growing should be kept less moist for the present, though not to the extent of causing suffering, and an occasional damping of the mulching on fine days will prevent evaporation of moisture from the soil to some extent. Where fire-heat is at coamand, it should be made some slight use of in dull and wet weather.

THE FLOWER GARDEN.

By Hedley Warren, Gardener, Aston Clinton, Tring.

Violas and Calcolories may now be propagated, as by this time there should be plenty of young growths fit for the purpose. Violas may be propagated by cuttings, or by dividing the old roots into small pieces and inserting them in light, rich soil in cold frames, or under hand-lights. Calcoolarias must be propagated by cuttings only, and may be treated similarly to Violas, but they must be protected from hard frost. If desired, the cuttings may be inserted in sandy soil in shallow boxes, and these placed in cold frames, where they should be kept close for a few weeks until rooted.

Violets are now making plenty of growth, and in some instances they are flowering freely; but preparations must soon be made to protect some of the plants during the winter. The frames in which they will be planted should be overhauled, and the soil for planting them in made ready. Wash with quick lime the sides of the frames or pits, so as to destroy any red-spider that may be burking there, for once this pest attacks the plants it is a difficult matter to cradicate it. After making up the bed (which should consist of two-thirds fibry boun and one-third leaf-mould, and a little sand) to a depth of 9 to 12 inches.

carefully lift the plants with as many roots as possible, and plant them about one foot apart each way, well water them in, and keep close for a few days, after which air should be freely admitted, and the lights removed altogether during favourable weather.

Pleating Hardy Bulbs.—Although many of these are not generally planted until November, if it be possible they should be planted during the present month, especially Narcissus, these commencing to make roots very early. Narcissus bulbs should be planted about 1 to 6 inches, but those of Tulips need not be planted at more than half that depth. If it is intended to plant bulbs in patches on the lawn, the present time is a good one for doing this, as the turf is in a moist condition.

Mesembryouthemum cordifolium variegatum.—Cuttings should be put in at once, inserting the enttings (which should be 1½ to 2 inches long) in light sandy soil in boxes or pots, placing them in cold frames, and keeping them close and shaded for a few days. Or they may be placed in heat, and as soon as the cuttings are rooted, removing them to cooler quarters, and, if possible, to a shelf near the glass during the winter months.

to acral Work.—Keep the flower beds and borders in neat condition, and roll the walks and drives so that these may be in good condition before the winter sets in. Evergreen hedges may still be trimmed, and the planting of shrubs proceeded with as advised in a former calendar. Some herbaceous plants will yet need further attention by securing the growths to stakes, &c. Some of the plants in the herbaceous borders will look unsightly from the presence of the old flower stems, which are turning yellow, and these should be promptly removed.

THE HARDY FRUIT GARDEN.

B . G. Woodgate, Gardener, Rolleston Hall, Burton-on-Trent.

Root-pruning, if it be done in an efficient reasurer, and at the correct time, is one of the best methods by which to make a healthy barren tree become fertile. The operation should be carried out as soon as the leaves commence to change colour in autumn. It may be done in some cases as soon as the fruit has been gathered, but greater care is then necessary that too severe a check be not given to the tree, and it will be needful to shade and syringe the foliage in the event of warm, dry weather. If the work be postponed until after the leaves have fallen, a season, at the least, is lost before bringing the tree into a fruiting condition; but if the root-pruning be performed as advised, many flower-buds may form before the corl of the season, and the young wood will become sufficiently ripened to withstand the frosts of winter.

Trees which have been planted only two or three years, but which are making too much growth, should be lifted and replanted. This simple operation is a work that requires great care, trench about I foot wide should be taken out round the tree at a distance of 18 inches from the stem, and about 15 inches deep. Cut off all roots found in making the trench; work a little of the soil away from the ball with a garden-fork, then insert a spade underneath the tree, so as to cut off any of the roots which may be growing downwards. The tree may then be lifted without disturbing too much of the soil from the roots near the stem. With a sharp knife shorten back the main roots, cutting them from the under-side upwards and outwards. The young rootlets which will spring from the point of the roots thus cut will with spring from the surface than if cut the reverse way. Prime back any of the smaller roots which may have been bruised with the spade, and replant the tree as soon as possible. Keep many of the roots near to the surface, and, if necessary, afford water to settle the soil about them. Afterwards make the trees temporarily safe by fixing them to supports. Trees which are too large to be lifted may be made fertile by taking out a trench 2 feet deep at some distance from the stem; this distance depending upon the age and size of the trees, cut off all roots that are found to extend into the trench.

THE WEATHER IN THE NORTH OF SCOTLAND.

Writing under Monday's date. 14th unst.), an Aberdeen correspondent says: "The cold, dismal, foggy weather still continues, with no improvement apparent. The bright expectations indulged in, in the months of June and July, as to an early barvest have been abundantly realised but the wet weather prevailing will not permit of the corn crops being removed from the fields. Three weeks have elapsed in many cases since the crops were cut, and much damage must necessarily ensue."

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER.

Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be written on one bide only of the paper, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illustrations, values by special arrangement.

Illustrations.—The Editor will thankfully receive and select photographs or drawings, suitable for reproduction in these pages, of gardens, or of remarkable plants, flowers, trees, &c.; but he cannot be responsible for loss or injury.

Local News.—Correspondents will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

Newspapers.—Correspondents sending newspapers should be careful to mark the paragraphs they wish the Editor to see.

APPOINTMENTS FOR THE ENSUING WEEK.

TUESDAY, SEPT. 22 Geneva Exhibition Temporary Show (twenty-three days).

SALES.

MONDAY, Sept. 21 \ Dutch Bulbs at Protheroe & Monday.

TUESDAY. Sept. 22 (Sale of Greenhouse Palms, Ferns, Herbaceous Plants, &c., at the Floral Nurseries, Castle Hill, Madenhead, by order of Mr. R. Owen, by Protheroe & Morris. Dutch Bulbs at Protheroe & Morris' Rooms.

WEDNESDAY, Sept. 23 { Dutch Bulbs at Protheroe & Morris' Rooms.

THURSDAY, Self. 24 | Dutch Bulbs at Protheroo & Morris' Rooms.

FRIDAY, Sect. 25 Dutch Bulbs at Protheroe & Morris Rooms.
Orchids at Protheroe & Morris' Rooms.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK — 56 3°.

The New Tulip We not glad to observe in so widely read a newspaper as The Field, in its issue for September 5, the following protest against the use of Latin names for florists' varieties of Dutch bulbs, and the needless and confusing practice of giving new names to old varieties. We have suppressed the names of persons mentioned in the article, not wishing to particularise any lirms when the practice condemned is become almost universal:

"We find in the catalogue of a large bulb-grower and dealer the following flowers of speech, descriptive of groups of Tulips:— 'Late Rectified Amateur Tulips,' 'True English Amateur Tulips,' 'True English Amateur Tulips,' 'True Old Dutch Amateur Tulips,' aud 'Darwin Tulips.' Confusion must arise in the public mind from these things, and such language is no gain to our garden lists. It is surely time the Royal Horticultural Society stopped in and simplified Tulip names a little, using English names for garden varieties, and stopping this needless confusion about late Tulips, which are dignified by so many names and called a new race, which they are not.

"It is not only that this misnaming is wrong in itself, but it confuses the fact that these so-called Darwin Tulips are simply the self-coloured kinds, once thrown on one side in the raising of the striped florists' late Tulip, varieties of T. Gesneriana. People should now begin to see that the once-rejected self-colours of the late Tulips are the finest and most

effective kinds. 'Late self-coloured Tulips' is quite sufficient to distinguish them as a group, each variety to bear any simple name fitted for it that the raiser selected. As in the case of the Carnatiou, which has been kept out of gardens for years owing to the misguided efforts of the so-called florists, and the Rose, which rosarians have tried to model on the form of a flat Dutch Cabbage, we see that similar silly ideals eet up for the Tulip begin to be knocked on the head. Then there is the misuse of Latiu names for garden forms, as such uames as Tulipa Gesneriana major aurantiaca maculata, for Tulips that are of garden origin, and should have an English or some simple name. Latin names are often falsely, and quite needlessly, applied to plants of garden origin; and hybrids and varieties of garden origin, it is now agreed, should bear simple names only, as, indeed, some of our handsome late Tulips now bear, such as Ida and White Swan. It is not a question of our own wishes ouly in the matter, as the question has been deliberately discussed by botanists at a conference, and the law as to names of garden varieties laid down, so there is no real excuse for giving a Latin name to any but the wild forms or species of Tulip."

Market Measures for Fruit and Vegetables PENDING the long-wished-for introduction of the metrical system of weights and measures into this country in place of the present chaotic ones now in vogue in al-

most all trades and occupations, it is very necessary that the buyer in the fruit and vegetable markets should know when he purchases in quantities other than strictly retail the exact equivalent of market measures of capacity. So long as his transactions with the market salesmen concern pounds, dozens, and similar obvious denominations, he is on safe ground. Far otherwise is it, however, when he buys by the sieve, half-sieve, barrel, flat, box, prinnet, banch, tally, &c. The introduction of some sane method in place of all these confusing measurements of capacity and of numbers would be of incalculable benefit to the ordinary purchaser, however little such a method would serve the needs of the retailer and middleman, by whom the market measures are well understood, and who make their calculations accordiugly. Still, in the interests of these persons, unvarying uniform measures of capacity would be a great advantage, especially in purchasing from those Continental countries which have adopted the metric system in its entirety, kilogramme and litre, their subdivisions and multiples being identical the world over.

We publish herewith some remarks, which we have received from a correspondent well acquainted with markets, growers, and marketmen, pertinent to the matter appearing in our issue of last week, p. 308.

"It seems somewhat odd that the very interesting and important question raised by the prosecution of Mr. A. REFFELL at Brentford, reported at p. 308, should have originated at a subordinate market, whilst the greater ones of Covent Garden, the Borough, &c., should have been ignored. The law is the same in relation to the stamping of measures in the county of London as it is in Middlesex, but hitherto no motion in the direction of prosecuting the users of unstamped basket-measures in London seems to have been thought of. When a law is made it ought obviously to be universally respected. In this case it seems to have been left entirely to the discretion of an inspector of weights and measures to make the law operative or otherwise. It does not seem as if the public, and especially that portion most immediately interested in the matter, viz., the retail buyer, had urged that the law should, in relation to ordinary wicker-bushels, half-bushels. or similar well-known measures, be put into force. Indeed, it seems rather as if the purchaser was more the gainer, seeing that all these wicker measures,

when first made (and they are always made to an exact pattern, of precisely the same dimensione), have, when thus new-and when, of course, they should be stamped—their smallest holding capacity. Every time they are used the etrain upon their sides becomes greater and the more they expand, so that the older they are, if also in ordinary condition, the greater the quantity they hold. All purchasers know that, and in purchasing, whether Peas, Runner Beans, or other vegetables other than Potatos, also fruit, such as Apples, Pears, Plums, Gooseberries, &c., they can always tell by lifting whether there be good measure or otherwise. So far as Potatos are concerned, 56 lb. is the statutory bushel-weight, and the baskets when filled are always placed upon the scales and weighed before sending to market. These scales and weights. it is well understood, must be stamped, and it is, of course, the duty of an inspector everywhere to see that they are so. But it is not possible to set up for Peas, Beans, Cabbages, and other vegetables, or for fruit, statutory basket-weights, because all these things vary so much, according to sort or to circumstances. But it is to the credit of the market-growing trade that they always give good measure. Anyone who has been even a disinterested observer of their packing methods for market cannot fail to have noticed that the haskets are charged to their utmost capacity ere the contents are finally secured. Of Peas and Beans, for instance, it is notorious that this hard pressing in of the contents, and heaping-up, means five pecks per bushel rather than four; but the grower prefers to err against himself rather than against his retail customer. It is because of this fact so very much that retailers, whether they be shopkeepers or costermongers, thrive so well. If there be any special need for the active supervision of the weights and measures inspector, it is really in the case of these retailers to the consumer in small quantities rather than the wholesale grower, whose keen customers can so well take care of themselves. There seems to be special hardship in thus attempting to interfere with a none too prosperous and yet most meritorious home industry, whilst such enormous quantities of fruit and vegetables come to our markets from abroad neither weighed nor measured, and in all sorts of packages-tubs, boxes, crates, &c., unstamped, and which are openly sold in the market as they are, the purchaser knowing about their small holding capacity, just as he knows the average holding capacity of the market bushel, a sieve, and no one is in the least degree deceived or injured. It is so obvious this state of things cannot continue to exist if the market growers' ancient bushel and half-bushel baskets be condemned, that we may expect to see the Market Growers' Association taking action to compel the London County Council to equally presecute importers, salesmen, &c., who dispose of vegetable and fruit produce in unstamped measures, even though in the guise of barrels, boxes, er crates; uo oue, of course, assumes that the inspector in this case has exceeded his duty, or that any animus has been shown towards Mr. REFFELL, or anyone else. The inspector has to do his duty, but it is hard to understand why this particular question should but now be raised, and the Act known as the Woights and Measures Act should so long have been the law of the land. Perhaps the market growers are somewhat to blame in not having sought to have their ordinary wicker baskets exempted when the bill was before Parliament, but probably no sensible person over dreamt that the Act would be strained and interpreted in the way this case shows it to have been. Some time since the London County Council was strongly denounced because it interfered materially with the profits of coal retailers, but coals have always been sold by weight, therefore no new principle was instituted. That body, however, has not felt it necessary to deal with market measures in the way that has now been done in Middlesex. To tackle the great metropolitau markets in this way would indeed be undertaking a stiff and troublesome job.

A reference to p. 341 in the present issue will show that the resumed hearing of the case before the magistrates sitting at Breutford resulted in the conviction of the defendant. It

Fig. 62—a summer camp for orchids, troy, new york, u.s.a. (see p. 338.)

is a matter which, from its very important bearings, cannot rest here, and we and our readers will await developments with some amount of curiosity.

A SUMMER CAMP FOR ORCHIDS.—In climates having more summer warmth than the warmest parts of these islands, cultivators of Orchids find it beneficial to these plants and other inmates of warm houses to place them out-of-doors during the snmmer months, taking care not to expose without shading plants liable to injury by direct sunshine; and to keep the ground moist on or above which they are placed. Mr. A. Dimmock, of Messus. F. Sander & Co., The Nurseries, St. Albans, Herts, to whom our thanks are due for the use of the photograph from which our illustration (p. 337) was taken, sends us the following note: - "About May I. A.R. SMITH, Esq., removes all his plants from the houses into the open air, and places them on wooden stages where at all times they are surrounded with pure air and ample shade from the trees. The collection includes some magnificent specimens of Cologyne cristata hololeuca, 3 feet across, and a quantity of small plants; fine examples of C. ocellata maxima (about 100 plants), C. Massangeana, C. Sanderiana, C. flaccida, C. Dayana, and others. Vandas and Aërides thrive well, and several may be noticed in bloom. Cymbidium eburneum and C. Lowianum, &c., also make veryvigorous growths; and at the rear a fine lot of Cypripediums in bloom make an extraordinary display. They all remain outside until the end of September, and are afterwards removed to their winter quarters, and grown comparatively cool, which enables the plants to pass through the excessive cold winter months without any difficulty."

THE LATE MR. BRUCE FINDLAY .-- We have received the following notification of a movement to be set on foot, having for its object the raising of a fund in aid of the late Mr. BRUCE FINDLAY'S daughters. At a meeting on Thursday, August 27, 1896, at the office of Mr. Joseph Broome, 6, St. Peter's Square, Manchester, Alderman GRANTHAM in the chair, it was stated that the late Mr. FINDLAY entered upon his duties at the Manchester Botanical Gardens in the year 1858. He introduced to the Conneil at different periods movements to improve the gardens and to make them more valuable and attractive as a place of resort, on easy terms, for the inhabitants of this great, growing city, and the neighbourhood. His chief object in life was to disseminate amongst the million a love of flowers and of their cultivation, knowing the consequent purifying influences this gentle art engenders. The thirty-eight years of his career spent as Curator and Secretary of the Society were oftentimes of great anxiety, requiring sacrificing labour, which he gave unstintingly. Mr. FINDLAY was well known in Manchester, London, and all over the country wherever there were botanists and floriculturists. His fame was not, however, confined to this country; his name and abilities were well known and respected among the leading horticulturists of Continental Europe. It was then resolved, on the motion of Mr. W. Stones, seconded by Mr. BLACK-"That a movement be inaugurated to obtain funds in aid of the daughters of the late Mr. BRUCE FINDLAY, for many years Curator and Secretary to the Manchester Botanical and Horticultural Society. That the following gentlemen constitute a committee (with power to add to their number), to carry out the object of the foregoing resolution:-Thomas Black, Joseph Broome, J.P., Rev. Harry de Trévelee, John Farrell, Chas. Wm. Foster, John Galloway, J.P., Alderman Gibson, J.P., Alderman Grantham, Thos. Harker, J.P., Councillor Jas. J. Lambert, Juo. W. Maclure, M.P., W. H. Milner, Conneillor Adam Murray, William Stones, Robert Tait, John Wainwright, J.P., T. R. Wilkinson. That Mr. Joseph Broome, J.P., be Chairman; that Alderman Gibson, J.P., be Deputy-chairman; that Mr. T. R. Wilkinson be Freasurer, and that Mr. James J. Lambert, Solicitor, be Hon. Secretary of this Committee." Promises of support by subscription have been received from various gentlemen, besides those which were mentioned at the meeting, viz.:-Joseph Broome, £105; Wm. Stones, £105; Richard Hardwick, £21; Alderman Grantham, £21. Chas. Wm. Foster, £21; John Wainwright, £21; T. R. Wilkinson, £21; Robert Tait, £21; Alderman Gibson, £10 10s.; Francis Robinson, £10 10s.; James Brown, £5 5s.; James O'Brien, £2 2s. Mr. FINDLAY has left three daughters, for whom very little provision has been made; their father's estate, when realised, will only produce a small sum. May we appeal to your most generous impulses to assist in this effort to lighten the cares of the future for these motherless and fatherless daughters, one of whom is in a very delicate state of health. Contributions may be made to any member of the committee; or to the BRUCE FINDLAY Memorial Fund Account, at the Manchester and Salford Bank Limited. JOSEPH BROOME, Chairman; ROBERT GIBSON, Vice-Chairman; T. R. Wilkinson, Treasurer; James J. LAMBERT, Hon. Secretary, 83, Mosley Street, Manchester. September, 1896.

NATIONAL ROSE SOCIETY.—A meeting of the General Purposes Committee will be held, by kind permission of the Horticultural Club, at their Rooms, Hotel Windsor, Victoria Street, Westminster, on Tuesday, the 22nd inst., at 11 A.M.

CRYSTAL PALACE FRUIT SHOW .- On Thursday, October 1, and the two following days, the Royal Horticultural Society's great Show of British fruit will be held at the Crystal Palace; and it promises to be, in regard to the entries, quite equal to previous shows of that kind held by the society. Entries in the competitive classes will be received up to Saturday, Sept. 26, and schedules of prizes in the meantime may be obtained from the office of the society, 117, Victoria Street, S.W. A lecture will be given each day on the following subjects:-Oct. 1, "The Importance of British Fruit Growing, from a Food Point of View," by Mr. EDMUND J. BAILLIE, F. L.S.; Oct. 2, "The Cider and Perry Industry," by Mr. C. W. RADCLIFFE COOKE, M.P.; Oct. 3, "Gathering, Storing, and Profitable Utilisation of Apples and Pears," by Mr. John Watkins, F.R.H.S. It is hoped that fruit growers who attend the conferences will join in the

Two Forcino Plants.—Doronicums are well-known bedding and border plants, but it is not widely known that D. plantaginenm grown in the open ground and taken up with good bulbs in the autumn, and potted, will flower well after the New Year, if gently forced, say at a temperature commencing at 45°, and never exceeding 55° by night, or 65° by day with sunshine. The flowers are valuable for cutting, and possessing stalks from 1½ to 2 feet high, they are of use for a variety of decorative purposes. Inula glandulosa also, under a similar kind of treatment, the actual forcing of the plants commencing in the early part of the month of February, is a useful plant. Tho natural flowering period falls in June, but when forced, flowers are obtained in April and May.

MR. J. IRELAND is desirous that we should inform our readers that he has been appointed representative for Messrs. Cowan & Co., Limited, of the Vineyard Nurseries, Garston, near Liverpool.

THE USES OF VARIOUS SPECIES OF GRASSES.—The estimation in which certain gramineous species are held varies much in different countries. For instance, Holcus lanatus, which in Britain is universally regarded as a weed, though it intrudes abundantly upon many of our pastures, is deliberately sown in mixtures of meadow-grass seeds in France. The Agricultural Gazette of New South Wales (vii., 5) cites another example in the tufted Hair grass (Deschampsia caspitosa, Beauv, or Aira caspitosa, Linn.). This species is locally known in England as tussockgrass, and as "bull faces" or "bull pites," and efforts are constantly made to extirpate it from our permanent pastures. In Australia, however, "it affords a fair pasturage if periodically burnt down." Graziers on and near the Australian Alps have been asked to send notes of their observations of this species, as it is regarded as quite possible that the Australian plants differ in forage-value from those of the northern hemisphere. The culms are sufficiently tough to permit of door-mats being made from the hay.

TEAK IN SIAM.—We learn from the report of the trade for the past year of Northern Siam, prepared by Mr. Archer, British Cousul at Chiengmai (Zimme), that the working of the Teak forests—the most important matter connected with British trade in that region—has of late been put on a much more satisfactory footing by a new form of lease issued by the Siamese Government, which has worked without serious complaint up to the present. An experienced officer of the Burma Forest Department has been lent to the Siamese to aid them in framing proper forest regulations.

MARRIAGE OF MR. HENRY CANNELL, JUNR.—Mr. HENRY CANNELL, Junr., eldest son of Mr. H. CANNELL, Senr, of Swanley, was married on Wednesday, the 9th inst., to Miss Christine Robertson, of Inverurie, at Inverurie.

ONIONS AT BANBURY,-Mr. H. DEVERILL'S annual Onion exhibition took place in his warehouse, Cornhill, Banbury, on the 5th inst., and it being market day, a good deal of attention was drawn to the show. The Onions, having suffered like most plants from the drought, were not so heavy, or on the whole so well finished as last year, though some fine bulbs were staged. The best six specimens of any one of DEVERILL'S Pedigree Onions was Ailsa Craig, weighing 151 lb., from Mr. T. Bowerman, gr., Hackwood Park, Basingstoke. Six bulbs of the same variety, from Mr. R. Lye, gr., Sydmonton Court, Banbury, weighing 14 lb, were highly commended. Mr. R. LYE was the only exhibitor of twelve bulbs of the new Challenge Onion, receiving the 1st prize. This is a red-skinned variety of a distinct character, with ilesh as free from colour as any light-skinned variety, and though flat-shaped, it is heavy and solid, and the base is full. Mr. R. LyE also had the best twelve bulbs of Ailsa Craig Onion, handsome and well finished, which weighed 281 lb. Mr. J. MASTER-SON, gr., Weston House, Shipston-on-Stour, was 2nd, with some capital Onions, only a little below Mr. Lye's in weight and quality. He had also the best twelve bulbs of Cocoa nut, weighing 264 lb. Mr. W. T. WYTON, gr., Crookley Hall, Garstang, was 2nd with smaller but well-finished examples. Mr. C. J. WAITE, gr., Glenhurst, Esher, was 1st with twelve bulbs of DEVERILL's Advancer Onion, weighing over 17 lb., Mr. LyE taking the 2nd prize; and the same exhibitors were again 1st and 2nd respectively with the Improved Wroxton, a globular variety which is said to keep well. One of the handsomest Onions is Anglo-Spanish, and Mr. Lye was 1st with twelve well-finished bulbs, weighing 20 lb., Mr. W. T. Wyron taking the 2nd prize; and Mr. LyE was 1st with twelve Lord Keeper of about the same weight. Mr. PEASE, gr. to Lieut. Colonel Morris, Swaleliffe, Banbury, being 2nd. Mr. LyE was 1st with a dozen Royal Jubilee, of about the same weight; and Mr. PEASE again 2nd. Rousham Park Onion was represented by a dozen fine bulbs, weighing 18 lb., from Mr. LyE; and Mr. W. KEEP, gr., Faringdon House, Berks, was 2nd. Some finely-finished Onions were shown by cottagers, mechanics, and others, the variety Ailsa Craig taking the leading prizes.

THE RAILWAY COMPANIES AND SMALL PARCELS RATE.—The experience of the Great Eastern Railway Company during the last nine months in their endeavours to bring the farmers in the country into closer touch with the consumers in London, have been, says the Times of Sept. 12, both interesting and encouraging. As will be remombered, the Great Eastern Railway Co. insisted on several conditions of packing being complied with by senders of farm and garden produce, and they undertook to supply boxes of various sizes at prices ranging from 1½d, to 5d, each. It was, however, found desirable to make producer and purchaser better acquainted; and the next step the company took was with the aid of their station-masters, to compile a list of farmers, market gardeners, and others in

the district traversed by their lines, who were prepared to send produce direct to consumers. The final edition of this list contained the names and addresses of about 900 such persons, and also stated what produce they could supply, and whether in large or small quantities. Yet even such a list would not have been of much use unless it had been properly distributed, and it is interesting to learn that the railway company has printed and circulated no fewer than 160,000 copies. The effect of all this has been that in many instances producers have been unable to execute all the orders they have received.

ever, all of the florets are perfectly tubular and united for about two-thirds their length, beyond which they appear as spreading lobes. It may be that from such a variety a new type of Dahlia will be evolved.

Chrysenthemum Queen of the Earlies.—Blooms of this new variety of Chrysanthemum reach us from Mr. W. J. GODEREY, Exmouth Nurseries. It is a Japanese flower, with slightly incurving and twisted florets. It is almost pure white, but there is a little amber colour radiated from the centre. The flowers are fairly large, and have been produced by plants bearing from five to eight flowers. It is specially

Fig. 63.—RUDBECKIA LACINIATA FLORE-PLENO *** GOLDEN GLOW.

From Mr. W. E. Gumbleton's Garden, Belgrove, go. Cork.

The demand for Asparagus, poultry, and eggs could not be met. The consumer paying better prices than the London wholesale dealers, it is likely that the latter in many instances will be ousted out of the district.

FLOWERS IN SEASON.—.1 Quilled Diddia.— From Messrs, Keynes, Wheleams & Co., Salisbury, we receive a Dahlia bloom with quilled florots, which is the first variety we remember to have seen exhibiting this peculiarity in the same degree. In such varieties as Lady Blanche, Guiding Star, and Grand Due Alexis, the quilled appearance is due only to the florets being folded inwards at the edges, and if one be taken out and examined, it will be seen to be flat when unrolled. In this new crimson variety, how-

recommended as a decorative variety, and for market work, for which purposes it certainly seems suitable. Mr. Goterier lives in a very favoured spot, and it is possible that in other districts the plant would flower rather later than in this case. In October, such a flower would be welcome, but we hold the opinion that large flowering Chrysanthemuns which bloom in September are not needed.

Violet Princess of Wal.—Some flowers of this single-bloomed Violet are obligingly sent us by Messex. H. Cannell & Sons. It was figured in Gurdeners' Chronicle, March 28 last, fig. 53. The flowers are very large, and the peduncles in specimens now before us are upwards of 7 inches long, and they are stout also. It is of French origin.

MOUNT LOFTY GARDENERS: ASSOCIATION.—This is a body recently formed of gentlemen in the locality of Stirling, South Australia, having for its objects the formation of a good library, to arrange exhibits of flowers and fruits, and as the Association increases to hold an annual show, and in every possible way to promote horticulture. At the preliminary meeting, which was held in the Stirling West Institute, Dr. Henderson read a paper before intending members on "What should be the Objects of the Association." Dr. E. C. Stirling is the President; Dr. Henderson, Chairman; Dr. Carr, Vice-chairmin; Mr. J. Howard, Treasurer; and Mr. O. E. Menzel, Hon. Secretary.

THE LATE F. G. TAUTZ'S COLLECTION OF ORCHIDS.—We learn from Messrs. H. Low & Co., Clapton N., that the entire collection of Orchids, including seedlings, once the property of the late F. G. TAUTZ, Esq., of Dibden House, Hanger Hill, Ealing, has passed into their hands by purchase.

NEWCASTLE AND DISTRICT HORTICULTURAL MUTUAL IMPROVEMENT SOCIETY.—The sixth session of this Society was opened on Tuesday night, the 15th inst., when the chairman, Mr. J. Bullock, read an interesting paper, entitled "Forty years in the Garden." Commencing with the kitchen-garden, Mr. Bullock compared the varieties of vegetables grown thirty or forty years ago with those that are grown to-day, treating the flower-garden in much the same manner. Passing on to Vines and Tomatos, Mr. Bullock introduced many observations that were especially interesting to the younger gardeners present.

THE VALUE OF SALTBUSH .- Baron von MUELLER favours us with an interesting account received from California, regarding the success of the introduction of Atriplex semibaccatum in the alkali land. For years this land was nothing but a barren waste, until it was suggested by Baron von MUELLER that the Australiau Saltbush should be tried. He forwarded seeds of various species, but the above-mentioned was the most successful. Now this land has rapidly increased in value, and is being sought after. Protessor HILGARD, of the University of California, in a letter, dated March 26, 1896, makes the following remarks:-"The reason why the other Saltbushes have not been mentioned more prominently is simply that they have not showed up to great advantage on the alkali soil of all kinds and grades (on our Tulara station. But the Atriplex semibaccatum spreads wherever it touched the ground, even in the hardtrodden stable-yard of the station and on roads, which none of the others will do. Sheep, cattle and horses, are particular in selecting Atriplex semibaccata. We find this plant refuses to do anything of practical value outside of alkali lands. Here, at the central station, Berkeley, it is the least successful, remaining quito inconspicuous. Where planted thickly, it grows taller, and can be cut with a seythe for folder. We cultivated nine species sent by you. The Professor remarked, in a former letter, that the value of this one plant to the alkali country of California had more than paid the expenses of experimental grounds from the commencement.

RUDBECKIA LACINIATA FLORE-PLENO "GOLDEN GLOW."

This very showy novelty came to me in March this year by post from Mr. Henry Dreer, of Chestint Street, Philadelphia, under the name of Golden Glow (fig. 63), and the plants, though not more than about an inch high, having a good portion of the tuber attached to each, began to grow almost immediately in the pots in which they were placed on arrival, and on being planted out in my border, quickly attained a height of about 5% feet, and produced a handsome bunch of about thirty flowers each. The duplicature at first was rather coarse and uneven, but the flowers greatly improved after a little, and I consider it quite an acquisition to our hardy borders. The plants are now throwing up young growth all round their bases, so that it should be a plant most easy to increase and propagate. W. E. Gumbleton.

HOME CORRESPONDENCE.

A REAL HYBRID BEAN. Recently, Mr. Eishop made a note in the Gredeners' Chronich respecting Mr. W. Smythe's hybrid French Beans. Being at Alton recently, I went on to Pasing Park, not only to see the veteran gardener there, and his beautiful place, but also this interesting hybrid. It has been declared that the two distinctive forms of Phaseolus multiflorus, or the Scarlet Ronner, and vulgaris, the dwarf French Bean, would not cross. Mr. Smythe has, however, conclusively proved that such a suggestion is incorrect. It is about ten years since began by crossing Canadian Wonder with Ne plus Ultra, both dwarts. Then, soon afterwards, the best product of the strain was fertilised with Scarlet Runner pollen. The product was unsatisfactory, and the best form again was fertilised with pollen from the Scarlet Runner once more. The result now is, that a Bean and plant are produced, having in great part the desired characters, which is a dwarf-growing Bean yet robust, having long erect racemes, as may be seen on the Runner Bean plant, and carrying bright-scarlet flowers. The plants not only crop most pro-fusely, but they seem to merit the appellation of per-The variety is named Smythe's Scarlet Perpetual Dwarf. The pods are long, and of the best form, very green, and slightly rough to the touch, though still most resembling those of a good dwarf Bean. seeds are reddish, but some are speckled and others striped, and are as pretty as they are distinct. This hybrid seems likely to become, when well selected, a formplable rival to the Climbing Bean on the one hand, and the old bush or dwarf torms on the other. The pods when cooked have in them much of the flavour of the Scatlet Runner pods without their roughness. An early selection has already received three marks at Chiswick. A. D.

APPLES AT MERTOUN HOUSE. - There is generally a wide difference in the appearance of Apples in various parts of the kingdom. The finest in size and colour are grown in districts south of London. In the Midlands the fruits are almost of equal size, but the colour is much deficient. Those from parts further north are usually poor in size and also colour. I was surprised, therefore, to find such good specimens in the gardens of Mertoun House, St. Boswell's. Berwickshire, the seat of Lord Pelwarth. A good collection is grown there on useful sized bush trees, cordons, &c. Mr. Fowler, the gardener, is quite an enthusiast about Apples, and everyspare nook on warra walls, ends of bothouses (χ, γ) , seems to be occupied by an Apple tree, and well do they repay in size and colour the attention be devotes to them. Among those noticed during a hurried visit I may mention Prince Albert, Pott's Seedling, Ecklinville, Peasgood's Nonsuch (very fine), Lord Derby, Melrose White (stetty), New Hawthornden, Ribston Pippin, several large trees looking very healthy), Lady Sudeley, Gas-First trees looking very healthy). Lady Suideley, Gascongne's Seedling, Yorkshire Beauty, Cellini Pippio, Mere de Menuge, Schoolinister, Worcester Peara ain, Cockle Pippin, Ohn, Ac. There was a fine crop of John Howing Crab on bush trees. Pears also do well on the walls. Jargonelle, Marie Louise, Williams Bon Chrétien, Easter Beuré, and several others of the best varieties, were earrying good crops. W. H. Dires, Believe Cuttle Gardens,

TROPÆOLUM SPECIOSUM.- Having been in a district in Scotland recently where this plant not only thrives, but in some cases is regarded as a muisance, I would like to reply to Mr. Coomber's remarks upon 277 by giving your readers the information I gathered regarding the culture and habit of the plant there. It is agreed that one has to be patient, for until two years at the least are elaps of the roots do not become established. During this time and afterwards it should be left overcly alone. The plant delights in a rich soil, inclining to stiffness, Scotland, a conthern position is invariably selected for its growth, and it flowers abundantly. This treatment I have also found successful in my own case, as three years ago I planted some mots at the foot of a south wall, using heavy Banstead burnwas despairing of ever being able to establish the plants, when, to my surprise, it started early this summer to throw up strong growths, which subsequently flowered profusely; and I am told by people who grow the plant well that I am sure of a succossful plantation and abundance of flowers for years I had the pleasure recently of seeing a splendid clump growing luxuriantly in a northern aspect at East Burnham Park, the residence of Mr. H. J. Veitch, who informed me that he had the staple soil removed, and provided ample drainage. A compost was used consisting of moderately light soil, with the addition of peat lime rubble, and sand, evidently a suitable soil, as the growth of the plant was strong. It occurred to me, however, that to ensure the very best results, a site commanding a certain amount of sun-heat is essential, and from my own knowledge of its habits I have formed the opinion that it is a much less difficult plant to grow than is generally supposed. J. F. Me Lord, Darce House Gordens.

DRY WEATHER BEDDING PLANTS. -1 can quite endorse" II, s "statements on p. 270 of the Gardners' Chronich for September 5 respecting these plants, and I think Zinnias most assuredly should take first place. I have noted them in various gardens this season, and always found them literally smothered with flowers. Zinnias, both tall and dwarf, are cipital town plants, not suffering in the least from smoke. Very large beds of mixed varieties have produced in our garden a fine display for three months, so long a season of flowering bein; a great advantage. Antirrhinums, too, are attractive and showy plants, coming true to colour from seed. Verbenns and Phlox Prummondi seem to have yied with each other in quantity of bloom this year, despite the fact that Verbenas are now seldom used as bedding plants; and given an average season, they are pleasing plants for beds. Ten-week Stocks do well in town gardens, and grow with great vigour; a large bet here, containing 1200 plants of these Stocks, has presented a cautiful show throughout the season, and their fragrance is, as every one knows, delightful. Nicotiana affinis should not be forgotten, and I do not remember having seen such a wealth of bloom on the plants as this year. The drawback of the plant closing its flowers the greater part of the day in bright sunshing is more than compensated by the show made and delicate odour contted in the early morning and in the evening. They have been planted in large quantities in the Lendon parks this season It is fortunate that these subjects will flourish under adverse circumstances; and pechaps I am correct when I say that a more trying season has not been experienced for a very long time-and this, together with the smoke, fog, acids, and other acrial impurities inimical to vegetation, renders gardening in London a difficult business. IV. H. Aggett, Bermond-

FAILURE TO FLOWER THE PRINCESS ALICE STOCK.—This beautiful Stock has failed to bloom with me this season, although the plants attained their usual size. Thousands of plants were raised from seed sown on a hot bed early in March, which on being planted out grew rapidly, but not a plant has flowered. In other years they have done well, and the seed was precured from a first class source. W. H. Amett.

HYBRID ANNUAL SUNFLOWERS. - Observing that a Cultural Commendation was lately given by the Floral Committee of the Royal Horticultural Society to a hybrid aunual Sauflower, I take the opportunity of making a few remarks on garden hybrids. I do not object to such an award being given to any beautiful flower, but these hybrid annuals are more ephemoral individuals, and though the same cross may be repeated, it can never be perpetuated by the seed of the hybrid. From my habit of allowing self sown seedlings of all kinds to flower in my garden where they come up, it is probable that few gardens have contained so many accidental and spontaneous hybrids between distinct species of hardy plants. I could enumerate them by dozens, but few have been worth the trouble of trying to perjetuite. One thing, however, I can assert about them that I have never yet had any experience of a true hybrid between distinct species proving constant from its own seed, so as to establish a new garden flower which can be repeated from seed. New varieties proving quite constant from seed may often be raised within a species, either by selection or by crossing distinct varieties of it. This happens every year with such plants as Papaver somniferum, and other variable annuals; but no constant variety can be produced between P. Rhicas and P. somniferum, though such are often offered in catalogues. years ago a friend told me he had raised a beautiful hybrid between Helianthus annuus and H. cucumerifolias, of which he sent me a photograph, and offered I told him that either the plant would be barren, or the seedlings would vary in the direction of one of the parents. He saved sixteen seeds, of which he sent me seven, all of which flowered. Our experi-ence of the seedlings was similar: they divided

themselves most conscientiously in flowering between the two parents. Some being unmistakeable H. annuus, and others H. cucumerifolius; these facts I recorded in the Gardeners' Chronicle. There are many genera in which hybrids between distinct species are more or less fertile; it is so with Dianthus, Lychnis, Aquilegia, and some others. On the other hand, I have never been able to lind a perfect seed in hybrids of Polemonium or Verbascum. though both form hybrids plentifully; or of Papaver, or of Campanula, with the exception of the closely-allied species of the C. rotundifolia section, which may be varieties of one species. With regard to Dianthus, there are two species, D. superba and D. casius, of neither of which I can depend upon getting a typical plant from seed saved in my garden, so great does their preference to fereign pollen appear to be. Moreover, in the third or fourth generation, D. exsius often develops a double garden Pink, such as would probably be classed as D. plumarius, though I suspect that D. cosius is a factor in many forms of garden The vagaries of alpine Primroses in crossing are too many and various to explain here. I will only say that seed saved in my garden from typical Primula viscosa, or typical P. auricula (yellow alpine), nearly always produces exclusively the many-coloured large-flowered kinds, commonly called border Auri-This has happened so repeatedly that I have eased to be surprised at it, or to suspect, as I did at first, that seed had been accidentally substituted. If I had space I might say much more about the spontaneous production, and the habits of hybrids, but I content myself with repeating, without any wish to dogmatise, that I should feel much obliged to anyone who would point out to me a true hybrid which can be reproduced in a constant form from its own seed. C. Wolley Dod, Edge Hall, Malpas.

MAIZE AS A VEGETABLE .- "A. M. O.'s" complaint with respect to the non-growth here of Maize as an article of food, and of course, as an ordinary vegetable, comes rather late. The subject is an old one, having been written about, discussed, and put to practical test, years ago. It must have been fully wenty years since, for it was in the days of the great Tichborne trial, that my immediate neighbour was William Cobbett, cldest son of the celebrated William Cobbett. My neighbour claimed that he, and not his father, was the actual introducer into England of the precocious variety of Maize known as Cobbett's Corn. He, for the few years he was resident at Bedfont. filled his garden each season with the variety, and also induced a neighbouring farmer to grow a large breadth of it for seed purposes. Every effort was made to popularise the variety, and induce agricul-turists and gardeners to grow it, not merely to produce ripe corn, but also green cobs, such as are referred to by "A. M. O." However, nothing useful resulted, and yet there could be no doubt but that the Cobbett selection was the very earliest variety in cultivation. Maize will grow with us well, but it ripens corn only when the summers are warm. The price of imported Maize is so low that under no conditions could it be made here a profitable crop. As to the green cobs, which can easily be produced, but delectable as they may be to Canadians and citizous of the United States, they do not take on here at all. We have a wonderful wealth of fine vegetables in this country, far beyond what America can furnish, hence there is less need here for such a vegetable. Again, the corn-cob eats here rather watery, and not very highly flavoured, and when cooked whole is a very nnhandy vegetable to partake off. In any ease, the British people are no more attracted by green corncobs than by Pumpkin pies. I do not for one moment wish to deprecate the green core cob as a vegetable; I am simply pointing out what has been done with it, and the probable causes of the failure to popularise it. $A,\,D,\,$

With reference to the note of your correspondent, "A. M. O.," as to the reason Maize is not grown as a vegetable in England, I think the answer must be that it does not prove a success in our ordinary summers. Somewhere in the seventies, when the late J. S. Morgan first took the late of Dover House. Rochampton, he was very anxious to have some grown for table, as he spoke of it as a choice vegetable much used in America. He procured some seeds which were sown in heat, grown on into strong plants in pots, and subsequently planted out the first week in June on a plot of ground that had been specially prepared by deep trenching and heavy manuring. Every attention was paid to them, but a very small percentage produced cobs fit for use;

the season being an unfavourable one. Maize was tried another year, but was not an unqualified success, and it was then given up as an unprofitable crop—at least, during my stay there—much to my employer's disappointment. Probably a hot summer would be favourable to it. J. Howard, Benham Gardens.

— Your correspondent. "A. M. O.," is evidently unaware that most varieties of Maize are totally unsuited for the English climate, and especially is this the case north of London. I have for the last twenty years or more grown every variety I could obtain, both in this country, the United States, and Canada. Of all the varieties tried, not one approaches Zea Curigua. In favourable years, we have grown this from 9 to 11 feet high, and one stem grown in 1894 produced three cols, each weighing, when stripped ½ lb. Although large cobs of the Curagua Maize can be grown easily, we have never found any variety which is good for boiling as "green corn:" it does not grow quickly enough to be tender when boiled, and it can only be classed as a decorative or fodder plant, and even for the latter purpose it is too uncertain and too much trouble to be very desirable so far north as here. Thus, Fletcher, Grappenhall, theshire.

BEGONIAS FROM BEDS.—The enclosed blooms of double Begonias are from an outside bed, and are all seedlings of this year. You will notice that all the blooms sent have stout upright stems, in which respect they have been very greatly improved during the last few years. There is nothing to compare with beds of double-flowering tuberous Begonias at this time of the year. Most bedding plants suffer early in the autumn through frequent rains, but Begonias seem the brighter for it. We have several thousands of this year's seedlings, and no other plant could have given us a brighter mass of colour than these have done during the past two months. T. Given, Courdray Gardens, Madhust. [The flowers sent are large, but their most valuable characteristic exists in the exceptional stoutness of the stems, and the consequent "staring" habit of the blooms. Etc.]

SWEET PEA "CUPID."—I have been trying this new Sweet Pea, but have not been successful with it; the plants seem healthy and robust, as you will see by accompanying sample, the flower buds are numerous, but somehow very few come to maturity, the most of them falling off when about half-developed. They do not seem to be eaten by misects. I shall be pleased if any of your readers can give me the reason for this. Ordinary Sweet Peas growing close beside them are flowering beautifully. A. M.

SOME FINE VARIETIES OF VIOLET.—I am sen ling you a bunch of Princess of Wales Violet, which is a fine single Violet. It has been grown nearly in the full sun this summer, and has thriven well. In the same hed there were likewise plants of the Princess Beatrice Violet, which has not stood the ordeal of the dry season so well as the first named variety. Princess of Wales is now in profuse flower, and the long stalks some 9 inches or more in length; the fragrance and bright blue colour of the flower should make the variety a general favourite, A. B. Walds, Cliveden Gardons, Maidenhaad. [A bunch of very fine flowers with extremely long stalks came together with this note, Ep.].

BLACKBERRY THE WILSON JUNIOR.-I was not a little surprised to learn from Mr. Divers that he had only recently succeeded in finding good examples of the Wilson Junior Blackberry, and these were in Berwickshire, because there are many splendid examples of this desirable fruit to be found in the Mid-kind Counties. Ten or twelve years since I planted a quantity at Hardwick House, Notts, and successfully traited it there for some years. The plants were obtained from a Leicestershire firm, who claimed the right of its introduction into this country. Like most of the family to which it belongs, it delights in a moist soil, and the natural soil of the garden being of a sandy kind, it became necessary to plant in a specially-prepared soil : large holes were got out, and filled with good, turfy loam, with a liberal sprinking of lime scraps. The plants were planted in November, the small growths being cut close back during the following summer. Shoots were made by the plant, ranging from 9 to 10 feet in length. These growths were carefully thinned out to about four of the strongest, which were allowed to remain, and secured to Larch-poles 10 feet high. During the succeeding autumn, quantities of fine fruit were gathered from time to time, which was enjoyed by all who tasted it. The

third or fourth year after planting, cause averaging from 10 to 12 feet were made by the plants. which also produced large quantities of excellent fruit. and with the exception of The aspect was south-west the old wood being annually out away after gathering the fruit, an occasional application of liquid-manure and a thorough mulching of fresh stable-manure in the autumn, no other attention was given. There are at the present time fruiting in the cottage gardens in various parts of Leicestershire plants of this variety of Blackberry, and I was pleased to notice a fine dish of the fruit at a village show in the Market Harborough district hat week At Woodhouse, Jugby, Market Harboro', Longhbor and other parts of this country it succeeds under good treatment. It will not succeed in very exposed situations, or in water logged soil. Many full with it in its young state after planting: it needs some slight protection to lestablished. The late Mr. William Ingram, after seeing the plants at Hard. wick House about six years since, assured me be intended to plant it at field ar, but whether he did so I cannot say, J. H. Willer, FRHS, Livetr.

— In answer to Mr. W. H. Divers on the above subject, I write to say that I grow the Wilson Junior Blackberry successfully. The plants are growing in good bring soil, in a line across the kitchen garden, the smoots being trained on wires. The fruit this second has been very fine and plentiful. I have already gathered two bushels, and should have been able to pick to the end of this month if the rain had not spoot them. I am surprised to and Mr. W. H. Divers has not succeeded with the plant, as it grows most luxuriantly here, and some if the shoots are not feet in length. Possibly the Inderence in climate may account for his lack of success. W. Williate, Monstee Milious to or long, Horits.

LAW NOTES.

A TRADE CUSTOM UPSET.

The legal arguments in the prosecution of Mr Alfred Reffell, firmer and market gardener of New Bridge and Covent Garden markets, Staines, and elsewhere, for having in his possession, for use in trade, an unstamped bush a measure, were heard on Saturday last by the Brent' od Justices. The facts of the case as reported in an ordenin-last week, were simple. Inspector Tyles, ne of the Middlesox county officials, sow the der udant's salesmon at Kew Bridge Market, se'l l'eas ir on a bushel basket, which was found to be unstamped and was so zell as aloga-To this the defendant requed that he could by custom of the trade, use such a basket for such a purpose. The Farmers and Market Garaners Association instructed Mr. Lyron, barrister, to argue on their behalf, and Mr. S. Woodbridge, School r. appeared for the Middlesex County Council. The latter, opening the argument relied on the Weights and Measures Act of 1878, that every utensal used for the purpose of measuring goods must be stamped. Section 2s required that all measures of capacity must be stamped and denominate it and their measure plainly marked on the outside; and Sect. 19 stated that "no local or customary measures, nor those used as heap measures, shall be lawfall. He would not contend that all baskets used by a charket gardener should be stumped. When used as vessels of conveyance this would not be necessary, by when used to measure a bushel of garden produce, they must be stamped, as in the case of liquor. If a class of wine or cap of teawere asked for, that was a varying measure for which there was no standard, and the Act would not apply but if a specific quantity, so has half-a-pint, were asked for, then the imperial measure must be given. So here, were a basket of Fers bought, the Act would not apply; but when a bashel was asked for, it must be served in a properly-stamped and denominated measure. If his learned it, all would assent now to have the bushel basket in question stamped, he would withdraw the prose stion on payment of the costs. The chairman, int-roosing, observed that stamping a basket would have little effect. The seed could run through it. Mr Woodbridge replied that by the bye-laws of the county baskets could be stamped and tested with the standards of the

Board of Trade. Mr. Byron, in reply, contended that the basket was not a measure, and was a recognise! either by seliers or buyer- in the trade as ne The sale of warden-produce was by parcel, it increases. and the practice had been followed from time immemerial. The charman said that a buver, a-sing fir a bushel must be presumed to consider he was obtaining that which he asked for. Mr. Evron replied that such baskets were well understood not to be measures. They could never be measures varied with the temperature, contracted or expanded with the damp, and could be compressed or extended. They were known as seves. A bushe', in the trade, wis taken two ways as a metrimeasure and as a basket to put things in. The Chairman stated that a double interpretation would not do-As to the sieve as a measure, Section 19 of the Act ab lished it. Here a bushel was asked for, Mr. Byron said that was disputed. The lower did not ask "What are the Pers a bushel " but " How much are these makels of Peas and a make recognised the trade bushel. Moreover, there should be standards at the market office, and the salesman should have been protected by that, is the inspector distinctly said he would be satisfied if stamped measures were on the premises. Thomas Wheatley, sale-man to the defendant, sudthat the lory-rin this case iske ithe price of the bushels of Peas, and he clearly understood he was buying by the parcel. He was a constant dealer. and know the costons of the trade. Bushel in the tride applied . backets. He believed he was protected by standard measures being in the market ffice. In cross examination, he said if a sieve in a bushel were askel for he should give a basket. Mr. W. Penpart, President of the Farmers and Market Gardeners, Association, Mr. Henry Mash of King Street, Covent Garden, a deiler of large experience. and Mr. John Asbee, Superinten lent at Covent Garden Market, gave evilence that the custom of the trade was to sell by parcel and not by measure. No one but a novice asked toria bushel, and the tribe well know how garden produce was s II Backets could never be standed by a set they altered in size under very higher imstances. A momb r i the arm of Moser- Perrin, basket makers. der sed that baskets were never in de to size there muzion to be three in a the asimilar or estre. closed the case. The chairman, in delivering onlymost add that the Pench were all flone job. on. that the wird bushel was used in the commandism. In , trade that would have all one measure, an imperial measure. It was a identified that the world beshelms should incern a in the trade. havora membered to a measure of expects. an imperial measure. They must held that the wirl lers of meant only the imperial meas re It was a used in the Borlot Trade regulations, and it could have not other legal meaning. If a pur baset asked for a bushel, he meant the legal measure and in this case he was served from an unstainfed measure. They were non h indebted to both sites for the way the question had been argued but they would have to convict the defendant for using in his tride an unstanged insigner. There wie no implication of from I, but the law was clear. The defendant would to the biventy slithner and costs and as the case wis the figurest importance, the Bench would assist tylevery means in their power if a case were desired for the Court al ve.

SCOTLAND.

APPIES

Fin good quantity, size, and high a correct Apples the present season will be long tendent end his Socioland. The crops are also some works earlier than usual, and on wall trees the trust is qual to the best grown in the southern and moderal counties of England; and it sime of the exhibitions the high colour of the fruits leds in equipment to appose they were grown in a hard have. But as become all known, Apples which are grown on walls and have plenty of sunlight laring development, are equal in

colour and flavour to the best orchard-house fruit which is grown. Indeed, we have many varieties of a deep golden tinge this year, which in ordinary years are of a pale green colour. These are from dwaif standards well exposed to the sun.

ONIONS.

This has been one of the best seasons known for vegetables in Scotland for many years. Culinary roots of all kinds are in fine condition in gardens of every grade I have visited. Onions have been for some years a specialty in the north, and the bulbs exhibited at many of the horticultural shows were in capital form. The largest bulbs I have remarked were half-adozen from Culzcan Castle Gardens, where Mr. Murray, the gardener, has done much to encourage the cultivation of this vegetable. The six were of the variety Ailsa Craig, and weighed 18 lb. My best bulbs this year for trial have again been Cranston's Excelsior, Veitch's Main Crop, and Dobbie's Golden Ball. They were sown early in March in the open ground, and are the best we have had for some years. M, T.

NURSERY NOTES.

WM. CLIBRAN & SON, OLDFIELD, ALTRINGHAM.

This firm has a large seed, bulb, and cut-flower business in Manchester, and their nurseries extend now, if we include the principality nursery at Llandudno and that at Bangor, to about 200 acres. The Oldfield nursery, which consisted in 1872 of one greenhouse and a few acres of land, has now, beside land, five acres covered with glass. As showing the growth of a horticultural establishment, the rent in 1872 was £20, and the wages bill about £50 per annum. The employ's are now over 200, and the wages total up to about £7,000, and the rental about £1,500. The firm are issuing this year 100,000 catalogues. The outdoor trade is a general one, comprising forest-trees of every description, flowering and evergreen shrubs, herbaceous and bulbous plants galore; while indoors there is a large stock of stove and greenhouse plants, and a varied stock for keeping the cut flower department in touch with the wants of the Manchester cut-flower trade. The out-door department has been taxed to the utmost this season, partly because of the iron bound season of the year previous, and of the growing demand among the people for plants to beautify their residences; so that while "bad trade" is a stock phrase among many of the community, there is evidently something to spare for the luxuries of a homestead, showing clearly enough, as is verified by our Board of Trade returns, and the sumtotal realised by the income-tax, that the nation is prospering. Instead of going into a general survey of stock-in-trade, which would make up far too unwieldy an article for such a paper as the titrdeners' Chronicle, I prefer pointing out some of the more notable and noteworthy subjects that passed before my eyes as possibly being more interesting and instructive to your realers.

FOREST AND ORNAMENTAL TREES.

The Scarlet Oak (Quercus coccinea) is a splendid ornamental subject, with its large leaves assuming already a tinted hue, but most beautiful in the autumn for its ruddiness. Querons pannonica, by name conferta here, is very striking, its large leaves cut deeply into about twenty divisions, having a glossiness of green that marks it out as one of the first of showy ornamental Oaks. The narrow-leaved infinitesimally-cut form of pectinata called filicifolia is striking because of its rigid, upward-growing, crowded caves. The variegated form of the Turkey Oak (Quereus cerris variegata) makes a handsome tree because of the whiteness interspersed with green of its oblong cut-in leaves. The golden-leaved Quereus concordia looks a free, decorative slow-growing Oak, with sencely a shade of green about its crowdedtogether pectingle leaves.

Chief among the Acers for making a grand landscape tree is Acer pseudo platanus var. atropurpureus. It has quite as large a leaf as the invaluable Syca-

more, and then its dusky-brown upper-surface, and its dull violet under surface, make it a most effective tree. Acer Schwedleri is a more liver-coloured leaf, and is generally three-lobed, and a limp that does not stand out like the leathery A. atropurpureus. The cut-leaved silver-leaved Maple (Acer dasyearpum heterophyllum) is also a stylish form of tree, with green leaves and pale wine-coloured stems and leaf foot-stilks. The purple form of the Hawks-claw Maple (Acer platanoides laciniatum) is one of the most distinct of the larger-leaved Maples, with large leaves, carried on slender foot-stalks. Acer Woorleyi is a nice greenish-gold-leaved Sycamore. Acer ginnala is a close-growing, upright, finely-cut Maple, not unlike a Birch in its leaf-form, a free-grower, and very effective as an ornamental tree.

The purple-leaved Hazel makes a very effective low-growing tree. Its great cordate, rounded, ovate leaves, tell well among its fellows, with upper-surface bronzy, and under-surface claret-coloured. Among the varieties of greens we have in a landscape this is a notable gain. The purple Birch is a fine fellow to the ordinary alha, having bronzy stems and leaves; and the cut-leaved Weeping Birch (Betula alba lacinata) passes pleasingly before the eye. The Aucuba-leaved Ash has large, evate, clouded green and white leaves, quite a departure from the normal form, and when grafted on straight stems, as it is here, it makes a beautiful ornamental standard. The mop-headed Robinia inermis makes a splendid plant, with beautiful pinnate leaves of a captivating shade of green; the standards here are very striking. The Imperial variety of Alder (Alnus glutinosus imperialis) has deeply incised leaves of a fine shade of green, and grows freely. The variegated Elm has about as much white as green on the leaves, and is a good grower, making shoots a foot long in the season. The goldenleaved variety of Ulmus campestris (Louis Van Houtte) has nicely formed ovate leaves of fine sheen of gold on the upper surface, ranking high as an ornamental subject. We were much struck with the golden variegated Cornel bush (Cornus sibirica Spathi. It is a free grower, and very striking in the landscape, standing well, too, in smoky districts, where Acer Negundo gives way. Among Laburnums, Cytisus vulgare aureum is a notable subject; its fine trifoliate leaves of a golden east attract attention, and it appears to be a free grower.

Chief amongst the lower-growing bush trees and shrubs, we would place the yellow-berried Hawthorn, Its finely cut leaves, as fine as anything in sub-tree life we have, command attention; and then its great crop of berries, generally in clusters of four or five, makes a fine terminal appendage to each shoot, The snowy-flowered Mespilus, with its white pentaphyllous flowers, make it a very desirable subject among others; and the Snowdrop-tree (Halesia tetraptera) is crowded up its stems with three to five drooping white bell formed flowers. The serrateleaved Elder (Sambucus racemosa serratifolia) makes an ornamental shrubbery plant, with a profusion of small scarlet berries in midsummer. The Weeping Pear (Pyrus salicifolia pendula) has hoary stems, with lanceolate leaves and prominent white mid-ribs, making ornamental plants when grafted. The goldenleaved Privet (Lighstrum ovalifolium aureum) is a handsome companion to the well-known and invaluable ovalifolium Privet, its leaves having broad irregular margins of white, the green centres having a tendency to colour ruby with age. The Wayfaring tree (Viburnum Lantana) makes one of the best of ornamental shrubs, with its crowd of scarlet berries, grand to look at, and fine for indoor ornamental work. The variegated Snowberry looks well, and is so useful for what we may call a seavenger plant under the drip of trees. The golden Weigela is a useful gain amongst that class of ornamental shrubs. Its leaves are large and goldencoloured, all the better for being set in reddish stems; the new Weigelia Eva Kathke has terminal dull-red Pentstemon-like flowers. The Brambles are in great variety, many of them showing leaves, flowers, and fruit together. Shepherdia argentea is a highly-finished subject with beautiful silvery leaves sbining like a piece of silk on bronze-gold stems.

Coniferous plants do not do very well about towns; the principal exception is the Austrian Pine, which is grown here in quantity. The one above all others that is doing well, and commanding a ready sale, is Picea pungens glauca. It forms a most symmetrical young tree of model pyramidal habit, the branches clad with closely set needles of a beautiful glaucous line; as a villa Conifer of not too large dimensions it is unequalled. Hollies, particularly green Hollies, are in quantities and in varied sizes, and are doing well. The decidnous Mountain Holly (llex monticola), is worth noting, although one does not take to Hollies without leaves in winter, but they are as singular and unlike a Holly as possible from its oblong pall-green smooth leaves, and then the balance is in its favour when it is furnished with strings of red berries on the leafless stems.

Herbaceous plants are largely grown, and the mixture of those and of Alpines in the rockeries, surmounted on salient spots with specimens of Adam's Needle (Yucca filamentosa), with its candelabralike flower spikes, now full of flowers, are very showy. Rudbeckia purpurea looks well in crowds of its composite flowers with dullish-crimson rays. Scabiosa caucasica is a striking plant with it bluish flowers, and the white variety is particularly choice. Heliopsis Pitcheriana carries splendid golden flowers, and is one worthy of general cultivation. Astilbe rivularis has fine leaves, and grows rampautly, all the more so in moist situations, bearing large white flowers. Columbines are in great variety, and so are Campanulas; the purple-belled glomerata being in profusion among many others. Centaureas and Chrysanthemums, particularly of the maximum type, arrest attention, as well as many other herbaceous, and alpine plants.

THE HOUSES.

Large quantities of Crotons are grown, one called ruberrinus being much grown for market; and so are Coleus, Caladiums, and every description of ornamental-leaved plants. Gardenias are found in quantities, and clean and vigorous, radicans and Fortunei especially. Stephanotis is of the fino free-flowering variety, with broadly ovate coriaceous leaves, and full of umbels as one looks along the branching stems. Pavetta montana with its Ixora-heads of white flowers is notable. I was glad to notice a fine lot of Plumbago capensis, and the white variety, which finds a ready sale. It is a good old decorative plant. Daphnes also are in quantity, and among a lot of Acacias, A. pubescens singled itself out. Rochea falcata, too, is worthy of general cultivation.

The stock of Azaleas is a large one, the one most in demand for selling as plants for greenhouses or for cut flower purposes, being Dentsche Perle. It is here in great quantity. Large beds of Begonias, both single and double, were a bluze of flower. Tea Roses are grown by the thousands in houses which get little ventilation. Ivies are done here excellently, and pains are taken to have strong fully-developed variegated sorts, strung up perpendicularly in pots set close together, Petunias, Pelargoniums, Tydeas, Gloriosas, &c., pass before the eye. Ferns of all sorts fill a large space, and so do Clematis of sorts, Fuchsias, and such like. Callas are also grown largely, the two most notable sorts being Elliotiana and Pentlandi, both having yellow instead of white spathes. The leaves of Elliotiana are not unlike a Dieffenbachia, pale green, with white blotchy spots. Both sorts have received the highest award from the Royal Horticultural Society, J. Anderson.

TRADE NOTICES.

Mr. Alex. McGregor, who has been head gardener to Charles Walker, Esq., of Brettargh Holt, Kendal, for the last twenty-two years, leaves to start business for himself at the Union Street Nurseries, Greenoek, which he has taken on a lease, and where he intends growing for market purposes, plants, flowers, and fruit.

Mr. H. W. WARD, an old and talented correspondent of this journal, having left Longford Castle Gardens, Salisbury, has taken some land distant about 2 miles from the town of Rayleigh, Essex, and intends to carry on the business of nurseryman and florist.

SOCIETIES.

BATTLE FLOWER SHOW.

"The month is now September," as John Hullah sang, "the hunter's moon's hegan," and so summer flower shows should be all over. At any rate, Battle Show would have been had it not been postponed because the chief day of the Hastings' Carnival was fixed for the same date, an alteration which, however, did not please many inhabitants of Battle, But be the differences of opinion what they may, the last horticultural event of the season is, as it deserves to be, very popular in the locality, and no exertions are spaced by the committee, and the honorary secretary, so sptly named Allwork, to make it successful.

The exhibits were arranged in three large marquees, but had there been a fourth it would have been better, as there were many evidences of crowding. As usual the cottagers showed very well, proving what a little encouragement, properly exercised, will do; and the prizes provided by the Duchess of Cleveland, by Lord and Lady Brassey, the Honourablo T. A. Brassey, and his lady, brought keen rivalry; while I am told the neatest and prettiest garden in the parish, which took 1st honours, was in every way a model of neatness and good culture. The lion's share of the prizes in the Open Division fell to Mr. T. Portnell, gr. to Sir Archibato Lam, Beauport, and, indeed, he seems quite invincible in flowering plants, and stove and greenhouse cut-flowers. He was also successful with fruit, but was beaten by Mr. J. Snow for Colonel Hankey's prize for eight dishes, which always invites a share competition. By far the best Peaches were staged by Mr. Jenner, gr. to E. T. Lambert, Esq., Telham Court. Fruit, generally, was not of the size and colour of that of last year, although Plums were very good; some Gages, and other kinds grown on a high wall on young trees, and shown by Major Thoure, were beautifully finished, and excellent in every point. Besides stove and greenhouse cut-flowers, florists' flowers were well shown; the Cactus Dahlias of Mr. W. Streedwick, and some bright and fresh Phox Prunnicondi, shown by Mr. J. Chivers, being very noticeable. Table decorations were good, Mrs. Glemeter from Hawkhurst being to the fore; while the best bouquet was that shown by Mr. W. Allen, gr. to Lord Brassey Normanhurst. A Correspondent.

HORTICULTURAL FÊTE AT MILTON.

SETTEMBER 9, 10.—The minth annual exhibition of flowers, fruit, and vegetables in connection with the Milton and Sittingbourne Horticultural Society, which took place in the Board Schools, Milton, on Wednesday and Thursday last, will be memorable for having been the means of bringing about what was, perhaps, one of the finest displays of horticultural produce ever seen in Kent.

An interesting retrospect of this unique result was due to the competition among amateur and cottagers' horticultural societies in the county for the Kent Champion-belt, offered by Messis, H. Cannell. & Sons, Swanley. The belt, accompanied by substantial money prizes, forms a competition which has been in existence for some years. It was instituted by Messis, H. Cannell & Sons with the object of promoting the higher cultivation of vegetables by amateur and cottage gardeners. The idea "caught on" directly, and for a time the champion belt took up its residence in West Kont. At the luncheon at Rodmersham last year, Mr. H. Cannell amounced that the conditions of the competition would in the future be altered, and that, in addition to the collection of vegetables, fruit and flowers would also be added. Under the new conditions, cultivators of flowers and growers of firm would be given chances of exhibiting their skill in these special departments.

There were ten entries this year, the competing societies being Milton (the holders), Ash-next-Sandwich, Chatham, Eynsford, Gillingham and New Brompton, Ightham, Milsted, Murston, Rodmersham, and Rochester and Strood. The exhibits were staged along one side of the building, and each collection was nearly put up. The competition was for ten varieties of vegetables, six dishes of hardy fruit (distinct varieties), and a stand of annuals, or other out-door grown flowers, arranged for effect (the dimensions of the stand to be 2 feet by 1 foot 6 in.). The collection of ruit consisted of two dishes of Apples and two dishes of Pears, each distinct 'six to a dish), a dish of twelve Plums, and a dish of Cherries. The vegetables were as follows:—Three Caulitowers, six Beet, six Tomatos, three Marrows, nine Onions, a dish of Kidney Potatos, and a dish of round Potatos (nine to a dish), thirty Runner Beans, six Carrots, and six Turnips. First prize of £3 and champion belt, Rodmersham, with an aggregate of £3 and champion belt, Rodmersham, with an aggregate of £3 points; and £1, Eynsford, 78 points; and 4th, Ightham, 70½ points. The highest possible number of points was 102.

THE BUNYARD CENTENARY SHOW.

SEPTEMBER 15, 16.—A thoroughly representative exhibition of fruits, vegetables, and thowers, was held in the Corn Exchange, Mudstone, on the above dates. Kentish grown fruit, with its charecteristic finish and quality, was strongly en cridate. This remark applies not only to out-door fruits, but also to Grapes, which were very fine. The vegetable

classes were surprisingly well filled. A most commendable feature of the show was the encouragement given by special classes to the smaller growers including the amateur and the cottager. The collections of vegetables exhibited collectively by separate local societies thoroughout Kent, made a most imposing display, there being no fewer than ten competing societies. The arrangements throughout were excellent, $the {\bf attractiveness} of the show being {\bf greatly enhanced} \ {\bf by} \ {\bf Messrs},$ BUNYARD & Co.'s own exhibits, which embraced a reproduction of the fruit trophy car which appeared in the Lord Mayor's Show in London in 1893. Groups of plants and cut flowers, also from the same source, added greatly to the effect. The good wishes of those present at the luncheon [held at the conclusion of the judging] were expressed for the increased prosperity of the firm, and an acknowledgment was made of the impetus given to fruit culture far and wide by the high-class productions so frequently and successfully exhibited from Maidstone.

Fruit.—For a collection of twelve dishes of indoor and out-door fruits in variety, Mr. Jarman, gr. to H. L. C. Brassey, Esq., Preston Hall, Maidstone, was placed 1st for a collection, including not a weak dish. Grapes were represented by Muserat of Alexandria, heavy bunches, fine in berry and colour; Black Alicante was well finished; Pears, Pitmaston Duchess and Triomphe de Vienne; Apples, American Mother and Gravenstein; Peaches, Princess of Wales and Sea Eagle; Nectarine, Victoria; Plum, Coe's Golden Drop; Melon, Hero of Lockinge; and a strong dish of Morello Cherries. Mr. Earl, gr. to O. E. n'Avignou Goldsmip, Esq., Tunbridge Wells, also exhibited well, his best dishes being Grapes, which were almost equal to those in the best exhibit.

For eight dishes, Mr. Rohinson, gr. to W. Lawrence, Esq., Hollingbourne, was 1st, having well-coloured Grapes, Machine Treyve Pears, and Cox's Orange Pippin Apples as his heat dishes. Mr Snow, The Gardens, Wadhurst Park, showed well in this class, but by an inadvertence he staged nine dishes, which led to his disqualification; his Grapes and Peaches were of excellent quality.

For six dishes, distinct (for gardeners employing a lad or hoy only), Mr Relf, gr. to A. T. Killer, Essa, Weavering Street, was 1st for an alteroid good exhibit of hardy fruits, the best being Grand Duke Plums, extra fine; excellent Pitmaston Duchess and Durande at Pears, and Worcester Pearmain Apples. Mr. Kennad, gr. to Hrubert Mosekros, Esq., was 2nd.

For three distinct kinds of Grapes Mr. Snow was 1st, with large well coloured Black Hamburgh, tine in berry; extra good Museats, large hunches, well finished; and Gros Maroc, in similar condition. Mr. Roderson, who followed, also showed well, but he had smeller bunches. Mr. East was 1st for Museats, with large well proportioned bunches, he being the only exhibitor. Mr. Snow won for Black Hamburghs, having another equally fine pair of bunches.

For Buckland Sweetwater Mr. Romason was 1st., and for any other white Grape also, having clear examples of Foster's Seedling. For two bunches of any Grape, size of berry and of bunch being the quadifications, Mr. Rabjohn, gr. to Hon. R. P. Neville, Birling Manor, was easily 1st with Gros Maroc, having weighty bunches and immense well-coloured berries.

Peaches were shown well, but in more than one instance the wet weather had left its mark upon them. Mr. Woodward, gr. to Room Lefon, Esq., Earlian Court, was 1st for six dishes, staging fruits of extra quality and finish, the best varieties being Dymond, Princess of Wales, Late Admirable, Sea Eagle, and Lady Palmerston; Mr. Browning, gr. to S. Lee Smith, Esq., Latkfield, was 2nd, with smaller fruits.

The best trio of Nectarines, Albert Victor, Victoria, and Pirmaston, were shown by Mr Snow; and the next best, Pine-apple, Rivers' Orange, and Pirmaston (very close to the former), came from Mr. Westowans.

Mr. JARMAN had the best three dishes of Peaches in Thames Bank, Dellegarde, and Sea Eagle, all in good condition.

Mr. Eart was easily 1st for Ploms, with well ripened Jefferson, Bryanston Gage, and Coe's Golden Drop.

Tomatos, though not present in large numbers, were excellent in quality, Mr. Lewis, gr. t (T. OLIVERSON, Esq., East Sutton Park, being 1st.

For two varieties of dessert Tomatos, Mr. Humphrey, gr. to A. M. Ibmaxa, Esq., Ashford, was 1st, with New Green Gage and Sunbeam, both yellow kinds.

With six dishes of Pears, Mr. Lewis was a splendid 1st, with very fine examples of Souvenir du Congrès, Williams' Bon Chrétien, Triomphe de Vienne, and Doyenne Boussoch.

For three dishes, Mr. RARJOHS was 1st; his selection comprised Doyenné Boussoch, Souvenir du Congrès, and Brockworth Park. Mr. Graves, gr. to Rev. E. BARTRUM, Wakes Colne, was 2nd.

In the class for twelve dishes of Apples, Mr. Lewis won again with an even exhibit, the best being Peasgood's Nonsuch, The Queen, Golden Noble, and Mère de Ménage.

In the class for six dessert kinds, Mr. BROWNING was a worthy 1st, having varieties of high-class quality, as Cox's Orange, Ribston, American Mother, King of the Pippins, and Mabbott's Pearmain; in Mr. GRAVES' 2nd prize exhibit, Ribston Pippin was very good.

Mr. Lewis was 1st for the best dish of Ludy Sudeley Apple, with well-coloured fruits.

Vegetables.—These were shown in large quantities in a number of classes, so arranged as to give an opportunity to

all, from those with large gardens down to the allotment holders.

The competition in the large class for not more than eighteen kinds brought four excellent exhibits. Mr. Snow was 1st, his collection being staged to the best advantage, whilst there was an absence of coarseness, for where size was apparent it was combined with good quality. His best exhibits were Peas (Kentish Hero), Hill's Prize Searlet Runners, Ellam's Cablage, Autumn Gant Caulitlower (large, but solid and clean), and Ailsa Craig Onions. Mr. Clements, gr. to the Rev. H. H. Domirans, Westwell Vicarage, was a very close and indeed, the arrangement only detracting in a measure from the effect as a whole; Red Celery was fine, so were Tomatos, Puritan Potatos, Excelsior Onions, and Erussels Spronts.

For nine varieties distinct, Mr. Kennard was 1st, with an extra good exhibit, well arranged, the quality being speedally good, and the best dishes those of Windsor Castle Potato, Autumn Giant Cauliflower, and Cheltenham Beet.

Vegetables shown in the next division were for prizes offered for special strains of Messrs. BUNYARD & Co.'s own selection or as introduced by them. For their strain of Cheltenham Beet, Mr. Thomas, gr. to Miss Balston, Thornhill, was 1st. For Hill's Prize Searlet Runners, Mr. C. Beale, Wheeler Street, was 1st. For Turnip-rooted Carrots, Mr. NUNN, Hollingbourne, was 1st.

For Bunyard's White Spanish Onion, Mr. Hosmer was again 1st with the finest sample we have seen this year; a superb exhibit. For St. John's Day Cablage, Mr. Clements was 1st; and for Elland's Early, Mr. Frond, gr. to J. B. Hinsen Esq., Tunbridge, occupied the same place. For Puritan Potatos, Mr. Clements won, and also for Windsor Castle, both being fine specimens. For Snowdrop Potatos, Mr. Cow ure, Ashford, was 1st with a good exhibit.

For six varieties of vegetables, open to amateurs who occasionally employ a gardener, Mr. Clements, Westwell, was 1st; and in a similar class for mine kinds, Mr. W. Mist, Lehtham, occurried the same rest of honour.

In the class for an unlimited collection, in which the members of various local societies may combine their exhibits, there was a grand display, and no fewer than tenentries for the eight very liberal prizes. The Milton Society was the winner of the 1st prize, and rightly so, in a very keen competition; this exhibit was of even quality, very fresh and bright. The lightham Cottagers' Society was a good 2nd, with a few more select dishes than in the 1st prize exhibit, but scarcely so weighty. These and all of the other exhibits in this class had a line of plants between and at the back of each; thus the divisions were simple and the effect was excellent, and the tidles were only about 2½ feet high, being thus very convenient.

cut However.—These were shown in three sections. Mr. KENNAM had the best twelve plants of Asters in pots as lifted from the ground; and Mr. Hardeway, gr. to Colonel Pirrithe best twenty four cut blooms in another class.

Other classes were provided for Asters, also for Scalious, Phlox Drammondi and Zumias, the exhibits being good, although in most cases the wet weather had evidently leid some effect upon them.

Messrs, Buyn un's own exhibits were distributed throughout the show to the best possible effect, forming good accessories behind dishes of fruits, and in various other ways. The firm's chief efforts with fruit were to be seen on the fruit trophy, as here they had a selection of the best Apples and Pears in biskets, and as small pyramids at the base, the whole being very tastefully finished by the use of Crategus pyracintha in berry and cut flowers. This exhibit was flanked by a group of well-grown and freely-flowered zonal Pelargoniums on the inside, and by cut flowers, plants in pots, and heavily laden trees of Apples and Pears in pots on the other

The proceeds after the payment of prizes will be distributed between the Gardeners' Royal Benevolent Institution, the Royal Gardeners' Orphan Fund, and the Church Institute at Maidstone.

ROYAL CALEDONIAN HORTICUL-TURAL.

SEPTIMBER 9, 10. The annual exhibition of this society was held on the above dates in the Waverly Market, Edinburgh, and was a very great success. The Finit classes were the most important, but Plants, cut Flowers, and honorary raiscellamons exhibits from nurserymen were present in considerable quantities.

FRUIT.

Soldom or never has the Waverley Market been tilled with a finer collection of Fruit, especially Grapes, than on this occasion. The white or black bunches of Grapes may at times have been bigger, but soldom, if ever, have they been equal or superior in quality, finish, and bloom. Not were big bunches backing; the E3 Bb, cluster of Black Museat grown by Mr. Lestir, of the Portcullen Gardens, Perth, formishing an admirable illustration alike of size and quality. There were also some admirable clusters in the general collections of truit, as well as in the special classes for Grapes; in the magnificent collection from the Forth vineyards; in those of Messrs, Bicchank, Inidage of Allan,in which Hauburghs, Alicantes, Almwick Seedling, Cooper's Black, and Camon Hall Museat, were splendially finished. The finest Museats in the show were from the same district, that is, at Rothessy, Erudge of Allan, grown by Mr. Rutherford on old established Vines. His launches were not more than from it to 4 lb in weight, but they had that rich

golden hue-the sure sign of the highest quality in Muscats that enabled Mr. RUTHERFORD to take the whole of the 1st prizes for Muscats The success was so striking and complete as to suggest serious questions as to the effect of size of wood and of bunch, and also the age of the Vines in relation to colour, quality, bloom, &c.

The question is not a new one, but it has not as yet been satisfactorily settled. Perhaps Mr. Rutherford may be induced to chronicle his views on the subject. He was good enough to state, in a conversation at the show, that the Muscats lost weight in the final process of finishing, as also that they seldom reached their best until probably two months after they were ripe. Most of us have noted such facts before, but they need re-discussion, as does another view advanced by the growers of the splendid Grapes from the Forth Vineyard, viz., that while manurial dressings do brighten the berries without doubt, their effect on flavour is probably nil, or may prove injurious. One more point: have the Messrs. Buchanan or any one else ever been able to colour the Cannon Hall Muscat up to the golden standard of Mr. Rutherford's Muscat of Alexandria?—and if not, why not?-or what relation the size of the herries has to the inferiority of the finish?

Grapes may be said to have dominated the fruit show—three fine bunches in each collection of twelve varieties, and two bunches in the collection of eight varieties. Then there were classes for the best bunches of Grapes, containing at were classes for the best bunches of Grapes, containing at least three varieties—for two bunches of Muscat of Alexandria; two bunches of Hamburgh; one bunch of bunch of Hamburgh; one bunch of Alicante; one bunch of Alicante; one bunch of Lady Downes; one bunch of any other black Grape; one bunch of Lady Downes; one bunch of any other black Grape; one bunch of any other white Grape; one bunch of finest-flavoured black Grape; one bunch of finest-flavoured white Grape; one bunch of finest densest-bloomed black. It is only needful to add that most of these classes were well filled to make it abundantly evident that the Royal Caledonian Horticultural Society still holds its place and power as patron of Grape and other fruit growing.

The names of the winners in a few of the principal classes are appended. There were also numerous classes for varieties of Apples and Pears in single dishes of six fruits, and of Currants, Gooseberries, &c. In the long list of classes for Apples, there was only one not familiar to Southerners, James Grieve,

raised in Edinburgh we understand.

Collection of twelve dishes of fruit, grown in an orchard

Collection of twelve anshes of trint, grown in an oreard house; not more than two dishes (distinct varieties) of each kind, Grapes excluded—1st, J. Hunter; 2nd, W. Cruden, Castle Kennedy; 3rd, Thomas Bowman, Lasswade.
Collections of twelve dishes of fruit, Pines and Bananas excluded.—1st, Mr. A. Kink, Alloa; 2nd, Mr. J. Hunter, Lambton Castle Gardens; 3rd, Mr. Smith, Oxenford Castle Gardens. Gardens.

Collection of twelve dishes of fruit grown out-of-doors, 1st, Mr. J. Day, Galloway House Gardens

Collection of eight dishes of fruit, 1st, Mr J HUNTER;

2nd. Mr. A. KIRK.

Six bunches Grapes, at least three varieties—Ist, J LESIF, Portcullen Gardens, Petth; 2nd, D. & W. BUCHANAN, Kippen.

Four bonches Grapes, distinct varieties 1st, J. Lesi ie; 2nd, G. POTTER, Whitehall Gardens, Cumberland

Two bunches Grapes, Museat of Alexandria 1st, W RUTHERFORD, Bridge of Allan; 2nd, J. MAITHON, Currichill Two bunches Grapes, Black Hamburgh. 1st, W RUTHER-

FOED, 2nd, G. POTTER. time bunch Grapes, Muscat of Alexandria, 1st, W. RUIMER-FORD; 2nd, P. M'HONALD.

One bunch Grapes, Black Hamburgh. 1st, W. RUIHER-FORD, 2nd, D. KIDD, Calberry Towers Gardens One hanch Grapes, Alicunts—1st, D. & W. BUCHANAN; 2nd,

One bunch Grapes, Aluwick Secolling. 1st, H. Thomas,

Bonnybridge; 2nd, D. & W. BUCHANAN, One bunch Grapes, Gros Colmar - 1st. A. Rowland, Yester

House Gardens; 2nd, J. MacPHERSON, Mayfield.

One bunch of Grapes, Ludy Downes. 1st, H. Thomas; 2nd,

J. Boy D, Callander House.

One banch of black Grapes not named above. 1st, W. L.

Farmer; 2nd, W. J. Green, Yorks.
One bunch of white Grapes not named above. 1st, J.

POTTER; 2nd, J. DAY.

One bunch Grapes, finest flavoured black—1st, G. Potter; 2nd, J. Morrison, Archerfield Gardens, Drew.

One bunch Grapes, finest flavoured white 1st, W RCTHERFORD; 2nd, J. S. ALIAN, Dumfries.

One bunch Grapes, black for finest bloom 1st, J Macenerson; 2nd, T Boyp, Falkirk.

One Queen Pincapple, not less than Tlb. in weight. 18t. D Kidd; 2nd, M M'INTYRE, Innerleithen.

One Pineapple, any other variety, not less than 5 lb. in

M. M'INTYRE weight

Collection of Apples, twelve varieties, three of each, ripe or unripe. Ist W. Cullon, Castle-Houghas; 2nd, J. Nowell. Six Dessert Apples, two varieties, three of each, fit for the table. 1st. J. Culton.

Collection of Dessert Pears, six varieties, three of each, ripe or unripe. 1st, J. Nowell, 2nd, J. Day Six Pears, two varieties, three of each, fit for the table. J

NOWELL.

VEGETABLES.

Collections of Vegetables were capital and clean, and the Potatos, notwithstanding the delage of rain, free from disease. Tomatos were superh; Cauliflowers good; Cabbages, Savoys, Brussel Sprouts, course and large; Celery and Turnlps, all the dishes, save one golden yellow, were good Leeks, a dozen or more, were superb; Onions fine but not

numerous considering that Edinburgh is full of French and German Onions, hawked in ropes through the town, and that Scotch Onions in the shops are mostly inferior. The pots of well-grown Parsley were a welcome feature, and all the best Carrots well shaped.

Collection of Vegetables, twelve varieties. 1st, D. M'BEAN,

Johnstone; 2nd, W. Harper.

Twelve varieties of Potatos, six of each. 1st, R. Wilson; 2nd, J. Cossar, Dunbar,

PLANTS

The two tables of plants exhibited for prizes were grace fully arranged, and maintained a nice balance between foliage and flowers. Messrs. Lairb's table, between the two, chiefly filled with choice new flowering and foliage plants, probably helped. Both stove and greenhouse plants were choice and good. A fine Clerodendron Balfouriana, a white Lapageria, and a grand Statice were excellent. Febage and table plants were also rich, fresh, and nicely blended and contrasted. Tuberous-rooted single and double flowered Begonius made a bright display of colour, while Fuchsias and Zonal Pelargoniums took us back to old times. Pot Lilies were plentiful and good, while Balsams, Cockscombs, &c., were inferior

Table of plants, circular, 12 feet diameter, for effect-1st, G. Wood, Oswald Road; 2nd, J. M'INTYRE, Darlington

Four stove or greenhouse plants, in flower, distinct varieties (First Prize presented by the Corporation of the City of Edm burgh)-1st, J. M. INIYRE; 2nd, G. Wood

Four Orchids, distinct varieties-1st, D Wilson, Glasgow; 2nd, W. HUTCHINSON

Four exotic Ferns, distinct species, exclusive of all others lst, J. Nafier.

Two Gleichenias, distinct species-1st, J. M'INTYRE Four Adiantums, distinct species—1st, J. M'INTURE Tree Fern, not less than 3 feet stem—1st, A. LAING

Four British Ferns, distinct varieties-1st, J. NAMER Nine dwarf British Ferns, distinct varieties 1st, J. PRESTON.

Six Lycopods, not less than three species 1st. G. CHAPTIN, Edinburgh

Six foliage plants distinct species, exclusive of Palms lst, T. LUNT

Six foliage plants, distinct species, exclusive of Palms, pots not exceeding 9 inches-1st, T. LINT.

Two Crotons, distinct varieties-1st, T Luxi; 2nd, J

Six table plants, foliage, distinct varieties, pots not exceed-

Six time plants, forage, distinct varieties, pots not exceeding 6 inches—1st, P. Mackay; 2nd, A. Unquiarr
Six table plants, ferns, distinct varieties, puts not exceeding 6 inches—1st, T. Lunt

Six tuberous-rooted Begonias, single, distinct varieties—1st, D. Mackay; 2nd, D. Adams.

Three tuberous rooted Begonias, double, distinct varieties

—1st, G. CHAPLIN, 2nd, S. Abbott, Prestonfield (Ionse. Two Fuchsias, distinct varieties—1st, D. MACKAY).

Six Chrysanthennums, not less than three varieties—1st, D. MACKAY; 2nd, J. PUARSON.

Three pots Liliums, distinct varieties, in bloom -1st, J Byin.

Roses

While the Royal Caledonian Horticultural Society has done much of its best and most important work among fout, it is even more creshtable to show to all country through its great shows in the Waverley Market what can be done by skill and culture and dogged pegging away to wrost a rich harvest of Roses from such leaden skies and flooded soils as have prevailed through this August and September. We have seen more and better Roses than were to be seen here this year; but when one heard, saw, and felt the energy and this year; but when one neard, saw, and tert the energy and persistency of these morthern rains, the wonder grew not that the Roses were not more perfect, but that so fine blooms were present. In fact, so far as not a few of the white and light pink Teas and perpetuals were concerned, most of them were without speek or flaw; while many, most of the more glowing colours, bore traces of overmuch washing. But considering their local environments for the last month or more, the Roses were wonderfully plentiful and good. Another singular fact may be note lefewor no southern growers put in an appearance. How is this? Is it that the prizes are not good enough, or were the rains, of which we have had so much in the North, came too late to reach the roots of the Roses? Or can it be that the Scotch trinity of growers for trade, the Messrs, Cocker of Aberdeen, the Messrs, Croll of Dundee, and Messrs, Smith & Son of Strangaer are impregnable on Calcdonian ground? It is gratifying to find them scattered so widely over the country so that their success can hardly be based on the unco-gudeness of either their soil or climate. These three firms secured all the prizes in the nurserymen's classes, excepting a few prizes taken by Mr. J. Downie, Edin burgh, and Messrs. Adam & Craigmile, Aberdeen, and Mr. H. Dickson, Belfast.

The prizes for private gardeners were also won by very few

Twenty-four Roses, distinct varieties—1st, W. Parrans, Rossica Row; 2nd, J. Hood, Twelve Roses, distinct varieties—1st, J. Hood, 2nd, W.

PARLANE Twelve Tea Roses, not less than six varieties. 1st, W. Partane, 2nd, A. Bryton,

CUL FLOWIRS OTHER THAN ROSES.

Gladiolus, Hollyhocks, clear of disease, beautiful and stately ; Dahlias, Herbaccous plants, Carnations, Prootees, Pansies, Chrysenthemuns, Asters, annuals, all were good. Bouquets, sprays, &c., in which Paneratiums, Eucharis, and Orchids played a conspicions part, were tasteful.

A FEW NURSERTMEN'S CLASSES.

Messrs. R. B Lairn & Sons won 1st prize for twenty-four evergreen shrubs in distinct kinds, there being no other exhibitor. The same firm were awarded 1st prize for six Palms in distinct species, Mr. A. Potter being 2nd.

For twelve Conifers in pots or tubs, distinct species, Messrs, J. Dickson & Sons, excelled Messrs, R. B. Laird & Sons,

Mr. J. Downie won for twelve plants most suitable for table decoration, Messrs. Lairo & Sins being 2nd.

The best tree Ferns we e from Messrs. R. B. Lairo &

HONORARY EXHIBITS.

The Show was largely furnished and enriched by the liberal contributions of the leading nurserymen. Messis, Dickson & Co., 7, Waterloo Place, Edinburgh, had a large table arched over with Grape vines, filled with choice protable arched over with Grape vines, filled with choice products, and fringed with a magnificent collection of Apples grown in their Silverton Nurseries. Messrs. Methyen & Sons had a splendid tible richly decorated with Lilies, Crotons, caladiums, a most satisfying maze of beauty and fragnance; and yet another filled with the newer and grander tuberous Begonia. Wr John Downe, Princes Street, had a rich collection of dwarf Cannas, Liliums, Begonias, and foliage plants. Messrs. Lairo & Sons had a rich display of charming folingel plants, crowned with the graceful Coccus plumost, and various other Palms and groups of plants. Messrs James & Son, of Hanover Street, showed some choice Conifers.

The growers of herbaceous plants were greatly in evidence. Messrs, Cocker & Sons of Aberdeen being the largest exhibi-Messers, Cocker & Sors of Adoption being the largest exhibi-tors, having over 200 species and varieties. Messers, Dorble & Co. of Rothesay, and others, also mure a brilliant display of Cartus Dablias, Marigolds, Asters, and Pentstemons. Tables of herbaceous plants were also shown by Messers, Lakno & Mather, Kelso. Mr. John Forness of Hawick, whose grand clean spakes of Holly bocks were the admiration of all; RELL & CO., Wenham: Mr. CAMPBELL, High Blantyre; ALLYANDER LISTER, Rothesay, who showed a matchless collection of Pansies. Chas laying of Jedburgh and others Mr. Eckford, Wem. Shiopshire, had a table of Sweet Peas; and Messes. Lang & Mattorn, Kelso, had a companion table, entirely furnished with their new seedling white Chrysanthemum Duchess of York, grown wholly in the open air.

CHARLES IRVINE, Jedburgh, showed the finest Penstemans yet seen; and the Mesers Buchanan, of the Forth Vineyard, a charming red Tourito, Stirling Castle.

Mr. Cutimerrson, from Rothesny, and others also showed herbaccons plants. Glabidus, and Hollybocks.

ADVICE TO THE TRADE.

THE Florists' Exchang of New York lately instituted a competition with a view of ascertaining the best method of forming and maintaining a satisfactory business establishment. The following are some of the recommendations made in the prize essay

Employ competent help. Pay your bills promptly Keep your environments they. Be punctual in delivering orders. Read, study, pause and consider. Maintain a reputation for honesty. Work hard and study intelligently. Be neat in your personal appearance. Never permit lounging in your store. Grow only what can be sold at a profit. Always grow the staples in cut flowers Send out all orders attractively put up. Post your customers on cultural points. Place advertising where it will do most good. If your trade calls for cheap plants, grow them. Offer bargains whe I you can afford to do so. Provide a waiting-room for your customers.

Keep your prices as consistently uniform as possible. Keep a supply of seeds and bulbs of the best quality. Keep a stock on hand of prdinières, baskets, &c.

Treat your employes as you would like to be treated.

Anticipate fashion, and be always ready to meet her caprice.

Keep a few of the advertised novelties; also one or twa curiosit es.

Remember daily the sick poor in your locality with a few flowers.

Show some telling effects in your greenhouses in plant arrangement.

Endeavour to educate your customers to purchase high-grade material.

Do the work for others entrusted to you carefully and conscientiously.

Adorn your surroundings where your work will be seen to best advantage. Always have some window attraction in the form

of a novelty or tasty design. Have the interior decoration and furniture in your

store in perfect harmony.

If situated for it, handle vegetable plants and fruits; but only the best varieties.

Send a few flowers to church every Sunday for pulpit and altar decoration.

Place your advertisement in the programme of any local concert or other local happening.

When called upon, be ever willing to aid an enter-tainment promoted for the sake of charity.

Keep your name before the public as much as possible, in every legitimate manner.

Make a personal canvass of your town for business wherever you are likely to secure any.

Be courteous to your patrons, and if you employ

help, exact from them similar conditions.

Provide your village square with a sample of free

bedding for one season; get a contract the next.

Explain the eccentricities of plants, according to environment; "What is one man's meat is another's peison."

Be generous to your patrons-and visitors; a button-hole or corsage-bouquet freely donated, always brings its reward.

Encourage the school children to love flowers by offering a prize in the form of plants or otherwise, for the best written essay on the subject of flowers.

Give free exhibitions, and invite the people and the press to witness them - say at Chrysanthemum, Christmas, and Easter times; or whenever you have a display worthy of notice.

Additional Hints to the Beginner.

Do not get discouraged.

Economise every inch of space,

Buy in bulk in order to get the largest discounts. Be able to deal intelligently with outside firms.

Have a thorough knowledge of the work you

are to undertake.

Bear in mind that what is worth doing at all is worth doing well.

Subscribe to your trade and all thorough-going

horticultural papers.

Employ your time profitably; it pays better to pull weeds than to talk politics.

Be methodical in keeping your accounts. Never hesitate to work at the head of your men when necessary.

ENQUIRIES.

"He that questioneth much shall learn much."-Bacon.

A CORRESPONDENT, "J. C. M.," would be obliged if any of our readers will state the disadvantages or otherwise of using the following for preserving woodwork of greenhouses and garden-frames, instead of paint. Creosote, tar. and sulphate of copper. Would either of them have an injurious effect upon plants, or give an unpleasant flavour to Tomatos or Cucumbers? He would want to use the preservative after the house is put up.

The Rev. Canon Ellacombe, Bitton Vicarage, Bristol, would like to know if Clematis Sieboldii (Bot. Reg., xxiv., 25, and tiarden, August, 1882); and Phlex Van Houtti (Bot. Reg., xxix., 5), are now in cultivation. He used to grow both, but has not seen either of them for many years, and would like to get them again.

Obituary.

SIR THOMAS DAWSON BRODIE, BART .- The death of this gentleman took place on September 6, at his Forfarshire residence, Idvies Honse, in his sixty-fourth year. The deceased baronet was known throughout Scotland for the active interest that he took in the welfare of the Scottish people, supporting many institutions established for science and art, and the furthermee of philanthropic work. He will be greatly missed in those counties where his extensive property is situated. He was a great admirer of the wild and beautiful, and spent large sums of money in Nairushire and Morayshire in developing and maintaining the forests and trees generally. He was a munificent patron of agriculture, horticulture, and arboriculture, of which there is much tangible proof at Carron House and Powgoulis, in Stirlingshire; and he was largely engaged in tree planting in Forfarshire. The funeral took place at Dean Cemetery, Edinburgh, on Thursday, September 10, in presence of a large number of sympathising friends.

RICHARD CURNOW.—We regret to announce the death of Mr. Richard Curnow, which occurred at sea, whilst on his way home on sick-leave from Columbia. Mr. Curnow had been in the service of Messrs, H. Low & Co., The Nurseries, Clapton, for more than twenty-two years, the last nineteen of which he had spent as one of their Orchid travellers, and he was, without doubt, thoroughly at home in his employment on foreign service. For some three months he had suffered from malarial fever, and succumbed to a paralytic seizure on August 25 last.

HENRY KNIGHT.—We regret to announce the death of Mr. Henry Knight, head-gardener to His Majesty the King of the Belgians, which took place at Lacken, Brussels, on Wednesday, September 9 last, aged sixty-two years. We shall allude at greater length to the deceased gardener in our next issue.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named: and this combined result is expressed in Daydegrees—a "Daydegree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending September 12, is furnished from the Meteorological Office:

"The weather during this period continued in a very dull, unsettled, and rainy condition over the greater part of the kingdom, but was relatively fur and dry in the north and west of Scotland. Thunderstorms were experienced in various parts of England during the latter half of the week

various parts of England during the latter balf of the week. "The temperature was above the mean, the excess being 2" in nearly all districts. The highest of the maxima were recorded, as a rule, either on the 8th or 9th, and ranged from 72 in 'England, S.' and the 'Channel Islands,' and in 'Ireland, N.,' to 66' in 'Seotland, W. The lowest of the minima, which were registered on rather irregular dates, varied from 36' in 'Seotland, E.' and from 42 in 'England, S.W.' and 'Ireland, S.,' to 51 in 'England, E.,' and to 56 in the 'Channel Islands.' the 'Channel Islands.'

"The rainfall was again greatly in excess of the mean over the southern half of the kingdom, and slightly in excess in 'England, N.E.' and 'Scotlind, E.;' elsewhere, however, there was a deficit. The greater part of the fall was recorded during the later days of the week

"The bright sunshine was again very deficient, t'e percentage of the possible duration ranging from 37 in the 'Channel Islands,' and from 24 in 'England, S.W.' and 'Ireland, S.,' and to 9 in the 'Midland Counties' and 'Scotland, W.,' and to only 8 in 'Scotland, E.'"

MARKETS.

COVENT GARDEN, SEPTEMBER 17.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

POTATOS. Supplies exceed demand, large quantities diseased. Best, 60s. to 70s. per ton. J. B. Thomas.

SEEDS.

LONDON: September 10.-Messrs, John Shaw & Sons, Seed London: September 10.—Messrs. John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write that the sudden condition of the limit naturally keeps lack sowing orders. As regards Red Clover seed, the universally poor prospects for the new crop have considerably augmented the values of fine yearling samples. The trade for Tribdium seens bearly over—Mustard and Rapessed are much mgod—For winter Tares, the demand for the moment is slow. Seed Rye, being source and waited, is desert. Charayseed keeps firm, the remark ide and continued absence of offers from Turkey of new seed inspires with confidence English. from Turkey of new seed inspires with confidence English

holders of last year's seed. For Wisconsin 2s, per qr, more money is asked. Harivot Beans are strong. The Board of Tride Returns give the imports of Clover and grass seeds into the United Kingdom for the first eight months of this year as 272,717 ewt., value £526,362, as against 261,964 ewt., value £609,657, for the corresponding period of 1895.

FRUIT AND VEGETABLES.

Glascow: September 16.—In the appended figures will be found the averages of the last week's prices:—Feuit:—Peurs, 2s. 4d per case; Apples, 6s. 6d. to 10s. do.; Green Gagos, 5d. to 6d. per pound; Gooseberries, 1s. per ewt.; Tomatos, Jersey, 4d. to 5d. per pound; Gooseberries, 1s. per ewt.; Tomatos, Jersey, 4d. to 5d. per pound; Grapes, home, 2s. do.; Turnips, 2s. to 2s. 6d. per dozen bunches; Cabbages, 8d. to 9d. per dozen; do., Red, 2s. 6d. to 3s. do.; Cauliflowers, English, 2s. to 2s. 6d. per dozen; do., Edinburgh, 1s. to 1s. 3d. per bunch; Parsnips, 5s. 6d. to 6s. per ewt.; Herbs, assorted, 1d. to 2d. per bunch; Locks, 2s. to 2s. 6d. per dozen bunches; Onions, Dutch, 3s. 6d. to to 4s. 6d. per bag; do., Portugal, 10d. per stune; do., Globes, 2s. to 3s. 6d. per cwt.; Parsley, 8s. to 10s. do.; Onions (silverskin), 6s. to 7s. per dozen bunches; Celery, 2s. to 2s. 6d. per bundle; Potatos, 8d. per stone; Curots, 4s. 6d. to 5s. per cwt.; do., new, 1s. to 1s. 6d. per dozen; Cneumbers, 4s. to 4s. 6d. per dozen; Lettnees, 6d. to 8d. per dozen; do., Cos, 9d. per dozen; Radishes, 9d. to 1s. per dozen; do.; Mushrooms, 1s. to 1s. 3d. per pound; Rubusth, 2s. 5d. to 3s. per cwt.; Beetroot, 7d. per dozen; do., new, 3s. 6d. to 4s. per dozen bunches; Cress, 2d. per backet; Brussels Sprouts, 2s. 6d. per stone.

Liverpool: September 16.—Potitos: Early Regents, 1s. 4d. to 1s. 8d. per ewt.; Sutton's Abundance, 1s. 6d. to 2s. do.; Maincrops, 1s. 10d. to 3s. 3d. do.; Bruce, 1s. 4d. to 1s. 8d. do.; P. E. Kemps, 1s. 6d. to 2s. 2d. lo.; Turnips, 6d. to 9d. per doz. bunches; Carrots, 6d. to 8d. do; and 3s. per ewt.; Parsley, 4d. to 6d. per bunch; Cheumbers, 1s. to 2s. 6d. per dozen; Onions, English, 6s. to 7s. per ewt.; do., foreign, 3s. 6d. do.; Lettuces, 6d. to 8d. per dozen; Cauliflowers, 6d. to 1s. 4d. do.; Cabbages, 6d. to 10d. do.; Celery, 1s. to 2s. per dozen heads. The prices in St. John's Market were as follows:—Potatos, 6d. to 8d. per peck; Grapes, 1s. to 2s. 6d. per pound; foreign, 4d. to 8d. do.; Pines, English, 4s. to 6s. each; Damsons, 12d. per pound; Cucumbers, 3d. to 8d.; Mushrooms, 4d. per pound;

VARIORUM.

THE ALIMENTARY VALUE OF WHITE AND BROWN BREAD.—At the Paris Academy's meeting in June, M. A. GHAND contended that white bread, made from pure flower, is quite as nourishing as brown bread containing all the brau of the Wheat, "I have already pointed out," he observed, "that an identical proportion of gluten is present in white bread made from flour that has been bolted, so as to leave 10 per cent. behind, and in brown bread male from flour, from which only 25 per cent, has been rejected." Another objection in ide to white bread is, that it does not furnish the human organism with sufficient phospheric acid; but M. GIRARD contends that the difference is unimportant in favour of brown bread. While, not even in the poorest countries, does bread now constitute the exclusive diet; eggs, milk, cheese, Chestnuts, Potatos, and other vegetables supplying a far more important contingent of phosphoric acid than the difference between the quantities contained in white and brown break. While physiologists assert that the human organism requires 5.19 grains of phospheric acid daily, M. GIRAND has weighed and analysed the daily food of labourers in the poorest districts, and found that it amounted to double the above quantity. He considers the normal bread to be that made from flour that has given up 30 per cent, of corticle, to serve as food for eattle to be given back to men in the form of meat, Janea Sa Irt.

A Business as Frontst: E. G. W. Doubtless there are openings in London for pushing men in the florist trade, but we are unable to advise you in the matter.

ACCOUNT OF MOUNT HARRY IN LAST WKIK'S 1880). By in elvertence, the name of the gardener was printed Mr. Jones instead of Mr. H. Garnett.

BOOKS: IV. E. Mushrooms for the Million, by Mr. J. Wright; published at the Journal of Horticulture Office, 171, Fleet Street, E.C.

CHRYSANTHEMUM LEAVES: Kill-m-right. We can discover no trace of fungus upon the leaves, and the disfigurement is, we believe, due to another cause. It might be the result of excessive or inappropriate manures, or other cultural error.

CHRYSANTHEMUM SHOW-BOARDS: E. C. L. For twelve incurveds, 2 by 1½ feet, holes 6 inches apart from centre to centre, 6 inches high at the back 3 inches in the frout. Two "12 boards" make one for twenty-four blooms, and three of them will do for thirty-six blooms, and so on; or boards may be made on this pattern to suit a particular number. The stands for six blooms are 1½ feet long by 1 foot broad. For Japanese blooms of twelve the board should be 2½ feet long and 1¾ feet broad, the holes 7 inches apart from centre to centre. Stands for six blooms 14 inches long and 21 inches wide, the height at the back 7 inches, and at the front 4 inches. All stands to be painted green, and to have the supports made secure. See the National Chrysanthemum Society's Annual Report for 1895, p. 56.

CINERARIA FUNGUS: S. J. G. The Cineraria rust is Coleosporium senecionis, P. The only remedy recommended hitherto is the spraying with Condy's Fluid—but your plants appear to be too far gone for any hope of success. M. C. C.

FRUITS FOR NAMINO: A. L. T. Only send six kinds; and if you can spare them, two fruits of each. When sending Plums and stone-fruits generally, forward shoots with foliage, and send them before they are perfectly ripe.

Growth on Leaves of Grass: J. D. The organisms growing upon the dead-grass and leaves belong to Physarum einerenm, a group which is placed on the borders of the animal and vegetable kingdoms under the name of Mycetozoa. See Guide to British Mycetozoa, price 3d., British Museum (Natural History), Cromwell Road, S.W. W. G. S.

INSECT: Dendrobe. It is a species of beetle, Diaxenes probably imported with some Orchids. As it is an insect which injures the leaves of Orchids and other plants, it should be hunted for and destroyed, although it is scarcely likely to become acclimatised. — Enquirer, Gryllus migratorius (Locust).

Manure from Town: W. E. The manure containing a large quantity of spent Hops will not grow Mushrooms, although when thrown into a help and allowed to ferment till partly decayed, it will make a good manure.

MELONS: A. G. H. The fruit and foliage sent showed no bacteriosis in the stems, or of any fungus disease in the fruit. The seorched spots on the leaves exhibited no trace of parasite, hence there appears to be no danger of infection, and we are disposed to attribute the condition of the plants to some error in culture rather than to inherent disease. M. C. C.

Monstera belictora: Thos. Fletcher. Not considered of sufficient interest to be figured. We believe that its receipt was acknowledged in due course. Many thanks.

"I The application I counse flow is, and a specially reads, are a numerous of the season, as severy to lar our resources. They colled our repealed we of time, labour, and many, of which our workers have little idea. We are will not before our cover-spindents us for as we can, but we must rejuct that they will observe the rule that not more than six varieties be seat at any one time. The specimens should be good mass, just approachem repears, and to proved desipposition, then should be projected anothered, and corefully parked. We do not a distribute to said a new through the part. The season was controlled.

Pears: 1, Gansell's Bergamot; 2, Beurré d'Amaulis, Apple, Cox's Orange Pippiu.—J. M. The small Apple may be merely a local variety; wo canot recognise it from such a specimeu as that sent.

NAMES OF PLANTS: Correspondents not answered in this issue are requested to be so good as to consult the following number.—A. B. L. Tropwolum speciesum. -Phono. Palinrus australis.-L. B. G. 1, Epiendrum species, send when in flower; 2, Epidendrum species, send when in flower; 2, Epidendrum purum; 3, Cypripedium Eismaunianum (Boxalli & Harrisianum).—F. M. Vanda tricolor formosa, a very pretty variety.—F. Br. 1, Polypodium aureum; 2, Adiantum cuncatum Phillipsii. 3, Grunourramma, echragae; 4, Phasis trapula; 5 3, Gynnogramma ochracca; 4, Pteris tremula; 5, Denstædtia davallioides; 6, Doodia caudata; 7, Begonia incurnata, commonly called B. metallica in gardens; 8, Hedychium Gardneriauum.—G. B. 8, Ginkgo biloba (Maiden-hair tree); 9, Ptelia tri-S, Ginkgo biloba (Maiden-hair tree); 9, Ptelia trifoliata (Hop-tree); 10, Biguonia radicans; fruits
next week.—E. C. L. Kindly send a shoot—Kent
& Brydon. Datura Stramonium.—M. 1, Pteris
argyrea; 2, Woodwardia radicans; 3, Asplenium
premorsum; 1, Todea pellucida; 5, Asplenium
bulbiferum; 6, Adiantum speciosum; froits next
week.—S. L. Epidendrum alatum. It is a very
pretty and fragrant species.—J. W. Haemanthus nathlensis.—S. J. G. 1, Dracena rubra; 2, Dracenna terminalis; 3, Croton, Johannis; 4, Croton ciena terminalis; 3, Croton Johannis; 4, Croton cena terminans; 3, Croton Johanns; 4, Croton chrysophyllum; 5, appears to be the same as 3; 6, Croton longifolium; 7, Croton irregulare; 8, Croton interruptum; 9, Croton nigrescens.—

W. M. B. Onopordon acanthium (Cotton Thistle).— J. M. P. Clerodendron fallax. The species Quercus next week, if they can be identified without fruits.— T. W. 1, Statice Halfordi; 2, Statice sinuata; 3, Statice floribunda: I. Statice macrophylla; 5. Statice profusa.—II. II. W. The crested Fern is Pteris cretica albo-lineata aristata; the other, Adiantum concinnum.—S. Dixon. The leaf is Pulmonaria officinalis (Lungwort), and the labiate plant probably a species of Dracocophalum. -O. B. 1, Ophiopogon Jaburan : 2, Anthericum variegatum, probably ; send when in flower.—W. II. Dirers.—1, Physostegia imbricata : 2, Chrysanthemum balsamita : 3, Sedum populifolium; I, Erica stricta; 5, Caluma vulgaris; 6, Acrostichum scandens.—G. Abbay. 1, Sedum sarmentosum; 2, Caphea cyanea; 3, C. Llavea (C. miniata); 4, Maurandia erubescens.

NARCISSUS BULBS: C. D., Rosemorran. Most of the balbs are bully decayed, and contain numbers of the "balb mite," as well as the large of a weryll. You should carefully examine the whole of the consignment, and reject all bulbs that are not perfectly sound. Burn these, as there would be nothing gained did you use them. If you have already planted some such bulbs, we should be disinclined to use the ground next year for any kind of bulbs. Plant it with other crops, and give it dressings with quick-lime and soot during winter.

Pracen House: T. B. If you want early fruit, choose a lean-to with a southern aspect, otherwise a span-roofed house is best. The pots to be planged in the soil of the border, if large, should have three holes just above the bottom of the pot, and one large one or three unddling sized ones in the bottom.

RED CURRANTS AND GOOSEBERRIES FOR A NORTH WALL: J. A. Of the first, choose Raby Castle, Red Dutch, Long-bunched Red, and Knight's Large Red. Of the second, choose the red-skinned varieties Rifleman, Ironmonger, Keen's Seedling, Warrington Smill Rough Red, and Slanghterman. Yellow: Leveller and Yellow Champagne. Green: Hepburn's Prolific and Pitmaston Green-Gage. Gooseberries may be trained fun-shaped, or as single and double-stemmed cordons; and Currants say U-shaped cordons on short stems, or as oblique cordons with two or four stems. The stems of cordons of either fruit should stand not nearer together than 14 inches; and having decided on the form the plants are to take, it is an easy matter to calculate the distance apart at which to plant.

RED-SPIDER ON CARNATION SOUVENIR DE LA MAL-MAISON: J. A. C. Repeated vaporising with Richard's XL All should rid the plants of red-spider without injuring the former, but as it has not done so, you might try a solution of soft soap, 4 oz., flowers of sulphur 2 oz. to the gallon, the sulphur mixed like mustard is made, that is with a small quantity of water, and then added to the water in bulk. By making 30 to 40 gallons of this mix-ture, and one man holding the plants over the edge of the tub containing it, they can be conveniently syringed by another operator on the upper and lower sides of the leaves. Two or three applications at intervals of three days should clear the plants of the plague. Preferably the mixture should be used in a warm state.

RED SPIDER ON VIOLETS: Jups. and E. C. L. If the soil and air be kept moist, and the under-sides of the leaves well syringed when the weather is dry and warm, the red spider will disappear. Use Richard's XL All Vaporiser, twice or thrice.

Roses: H. M. E. We know of no Rose named La Belle Lyonnaise; but there is Belle Lyonnaise of Levet, sent out in 1867, with canary-yellowcoloured blooms, changing to whitish salmon-red; it is a seedling of Gloire de Dijon. Lacharme, in 1854, also named one of his Roses Belle Lyonnaise, but it is flesh-coloured. Gloire Lyonnaise is one of Guillot's raising, and came into commerce in 1884. It is a very vigorous grower, and on that account might be called a climbing variety; its flower has petals of chrome yellow at the centre, changing to glistening white in those towards the margin of the flower.

Rest on Grapes. J. A. See answers to correspondents, under heading "Injury to Grapes," in our issue for September 5 last.

Strawberrh s: α , B. The first runner coming from the mother plant will in all probability produce the stronger plant in a given time than one that is produced further away, owing to the great length of time which it has for development before it is detached

TWIN COCOMBLE: (i. D. A good specimen of a very frequent phenomena.

Wall-plates of Glassiousis: R. P. Red, or pitch Pine. It should overlap the brick-work on either side, and the overlapping parts channelled or ploughed to prevent the ingress of water.

AND SIXPENCE FOR EVERY ADDITIONAL LINE.

If set across two Columns, the lowest charge will be 20s. If set agross three Columns the lowest charge will be 30s. Page, £8: Half Page, £4 10s.; Column, £3.

GARDENERS AND OTHERS WANTING SITUATIONS. 26 words, including name and address, 1s. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.

Notice to Advertisers.—In many instances Remittances in Payment of Repeat Adver-tisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all.

Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.

Position.—Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.

Births, Deaths, and Marriages, 5s. each insertion.

POSTAL ORDERS .- To Advertisers, Subscribers, and Others .- It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to II. G. Cove, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.

N.B.—The best and safest means of Remitting is by POST-OFFICE MONEY

ORDĚR.

Advertisements for the current week MUST reach the Office by first post, Thursday morning.

All Advertisements should be addressed to the PUBLISHER.

Publishing Office and Office for Advertisements, 41, WELLINGTON STREET, STRAND, W.C.

SUBSCRIPTIONS.

All Subscriptions payable in advance. The United 3 months, 12 months, 15s.; 6 months, 7s. 6d.; 3 months, 3s. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Post-office, Great Queen Street, London, W.C., to H. G. COVE.

Subscribers who experience any difficulty in obtaining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by post, the cover should be forwarded with complaint).

SCHRODERI

SANDERIANA £8 ,, MENDELI $\pounds 9$

The cases measure about 20 by 34 in., and contain from 40 to 70 good strong pieces of Cattleyas, of Odontoglossum crispum about 250, and of the other Orchida 180 good strong plants.

The plants are packed with the greatest care and best method, but under no circumstance will G. K. hold himself responsible for the state of plants on their arrival in Europe. Conditions:—All Consignments are shipped entirely at Buyer's risk and expense from port of shipment. Plants ordered must be paid for on receipt of bill of lading to Messrs. ROESING BROTHERS AND CO., 10, Basinghall Street, London, E.C., who will then give orders for forwarding the consignment to the Purchaser.

The best time for dispatching Orchids from here, and to establish them with the best advantage in Europe, are the months—December to April.

EARLY ORDERS INVITED.

A considerable reduction will be made on orders of 1000 and more of each kind of Odontoglossum, and on four cases and more of Cattleya of each kind, Orders of less than one case of a kind, can only be executed at a 25 per cent. higher price.

VALUABLE ORCHIDS.

About 3000 BARE ORCHIDS in spleadid condition, of which a great many have been gathered in bloom by an experenced Collector, from quite new localities. A great number are natural hybrids, and unique Odootoglossums and Cattleyas. They have been painted by him. Also there are fifty-three amongst them that will be guaranteed unique types, and not existing in Europe. Cattleya Pyanæ (after locality of section), labitat, flowers from May to end of June; large wooderful new variety. Some of these with over 100 bulbs and leaves. Cattleya azulea, the finest Cattleya in the world; large specimens, but only a limited number collected in hioom; there are pure whites amongst them. There is also a new variety of Cattleya autumnalis, which flowers in its native country at Christmas, with large sepale and petals, with dark or mon. Also an unque Cattleya Mossie albi, with flowersheaths; and C. virginalis, C. Wagneri albe, C. chirgaeanse albi, C. Percivallians alba, two plants with flower-sheaths, collected and painted in bloom; many rare varieties of Oncidium, large plants. Also 50 Odoutoglossum xanthium, true; 80 Cattleya Mendoze, never imported before. All to be Sold in one lot. The unique plants cons st of Cattleyas and Odontoglossums. The whole have been placed in a Private Genfleman's hands, and will be guaranteed by him. Address I tters only—

JAMES VEITCH & SONS

ROYAL EXOTIC NURSERY.

CHELSEA, LONDON, S.W.

FROMOW AND SONS beg to draw the attention of Planters generally to their extensive and varied Stock at their Nurseries at Windlesham, Bagshot, Surrey. The plants are all very carefully grown, and cannot pussibly be in better condition for removal, everything having been transplanted within two years, and much of it during the past season. There is a much larger stock than in Mr. R. Mason's time, W. F. & Sons having added a large farm at Astage Hill, adjoining part of old nurseries, which is well s'ocked with good and useful things well worth iospection.

Descriptive Catalogues on application.

Gentlemen visiting the Nurseries would be met at Sunningdale or Bagshot Stations by appointment.

The following are a few items of the Stock to offer:—200 000 SHAUBS, for potting, boxing, and winter-gardeoing. 30,000 DWARF and CLIMBING ROSES.

6,000 STANDARD ROSES.

40,000 FRUIT TREES.
200,000 PRIVET OVALIFOLIUM.

40,000 Best GOLDEN PRIVET.
200,000 RHODODENDRONS, named Hybrids and Seedlings.
50,000 GRODODENDRONS, named Hybrids and Seedlings.
50,000 SEAKALE, for forcing.
50,000 IRISH IVIEN, in and out of pots, 1 to 12 feet.
10,000 Standard PLANES, LIMES, ACACIAS, and ORNAMENTAL TREES, DUTCH and OTHER BULBS, of all kinds, at moderate prices.

Mason'e Nurseries, Windlesham, Bagshot, Surrey; also Chiswick, Hounslow, and Acton Green.

Mason'e Nurseries, Windlesham, Bagshot, Surrey; also Chiswick, Hounslow, and Acton Green.

WORDSLEY, STOURBRIDGE.

KING OF DENMARK.

Received an Amorel of Merit, May 5.

Flowers semi-double, measuring from 2 to 24 inches in diameter; colour rich risy salmon. Habit of plant dwarf and sturdy. Au acquisition either as a pot plant or for cut flowers. Strong plan s, in 48 pots, 18t. per dozen,

Packing free on rail Cash with order,

M. LARSEN,

Roebuck Nursery, Infield Highway, Middlesex; And 273, COVENT GARDEN FLOWER MARKET.

ORCHIDS — ORCHIDS.

Clean, healthy, well-grown plants at reasonable prices; many large specimens and rare varieties.

CHOICE DENDROBES A SPECIALTY. PLEASE WRITE FOR LIST.

JAMES CYPHER, EXOTIC NURSERIES, CHELTENHAM.

FOR OUTDOOR & INDOOR CULTURE Large Collections of all the very Best Varieties of Hyacinths, Tulips, Crocuses, Narcissi, Snowdrops, Irises, Lilies, &c.

Only the very best supplied, Prices extremely moderate. Illustrated Descriptive Catalogue (No. 468). POST FREE ON APPLICATION.

Gardeners' Thronicle.

SATURDAY, SEPTEMBER 26, 1896.

THE ROSE SEASON OF 1896.

T is very difficult, may, impossible, when writing about the Rose season, to dissociate our ideas of it from the various exhibitions which have been held during the season, nor perhaps is it quite necessary to do so. Some people are very fond of railing at fat Roses as if they were monsters of iniquity, and as much to be avoided as a stout lady in an omnibus but after all, where would the Rose have been at the present day if growers had not expended their energies on the beauty of such flowers. "Oh!" it would be said, "we should have had the dear old Roses of our early days;" but these were only summer Roses. They were pretty enough, and sweet enough, but you might have gone out into acres of them from the month of July enwards, and not a ghost of a bloom could you find; but now with our hybrid perpetuals, Teas, and Noisettes, and that anomalous section, hybrid Teas, we can go on gathering Reses until frost interferes. Yes, truly, we had the monthly China, pleasant and sweet enough, but not to be compared with the other sections to which I have alluded.

Garden Roses have, I think, obtained a very fair share of attention during the past few years, and it is just possible that people may go to the other extreme-as they did, for example, with single Dahlias. I suppose that of ten persons that used to grow them some years ago, only one does so now. Thus, though I greatly admire single and garden Roses, I am not prepared to disparage all others, those especially which have benefited by the skill and attention of the hybridiser. The National Rose Society has, I think, been not slow to recognise their value and importance, although, at the same time, it does favour the exhibition varieties

THE CHARACTER OF THE SEASON.

In estimating the character of the past season, we must bear in mind the great difference there is in the various localities where Roses are grown. Between the south of England and the northern counties there is a fortnight's difference in the time of blooming; and when the season is abnormal, that is, when it is especially early or especially late, it may tell injuriously on the Rose-garden, more particularly when the owner is an exhibitor. And so it is again in the matter of climatic influence; in an especially droughty season like that which we have just passed through, it has not affected all districts alike-for example, here, in East Kent, it has not been auything like so severe as in the western counties, and not to be compared with the drought of 1893. We had a splendid twenty-four hours' rain at the end of June, in which many other districts do not seem to have shared. I have a letter before me from a well-known amateur

in Somersetshire, in which he says: "We have had the worst drought here ever known, my Roses were all out of bloom by the first week in June; and although the second bloom gave me some good flowers, they were very irregular, and our time was so occupied with watering and keeping things alive, that we could not attend to the special requirements of our beauties." And this had held all through the season, not only with the Rose, but with other flowers; and, therefore, anyone living in a more backward situation would be in a much more favourable position, either for enjoying his Roses at home, or for exhibiting. Effects of the drought must not be so much looked for among the large growers, who have acres of Roses, as amongst amateurs whose culture is confined to a few hundreds or thousands. There are other points which have an amount of influence ou such questions which are not always taken into account: in a soil which is light and friable, the Roses will come much more rapidly into bloom than they will in a heavy and tenacions loam; alse it makes a considerable difference whether a grower has all cut-backs or whether he has a quantity of maiden plants, the latter are always later than the former, and I do not think that any exhibitor can continue showing all through the season unless he have a good number of these. From these and other circumstances it generally happens that the opinions of growers as to the character of the season will vary much, and will be coloured by their own personal surroundings; but this has not been the case with the past season, an unanimous opinion from all parts of the kingdom being that it is the worst season that Rose-growers have experienced since 1879. Those who recollect that terrible year, will remember the incessant rain which ruined all their hopes, and made them almost ashamed of the Roses they had to exhibit; this year, although the Roses were very inferior, it was from a very different reason. The long-continued drought at a time when they are generally in the habit of receiving a plentiful supply of moisture, and the hot sun which accompanied the drought, rushed the flowers prematurely into bloom, and where the locality was an early one this was the more keenly felt, as I have already noticed with regard to Somersetshire. Owing to the same cause we missed the stands of Lord Penzance's boautiful Sweet Briars; and little was seen of any of the earlier-blooming Roses.

INSECTS AND DROUGHT.

It was somewhat remarkable that in a season when insect-pests were so abundant, when our Oaks were half denuded of their leaves, and onr seedling crops eaten off by ground caterpillars, that we did not suffer more from insects on our Roses. I do not think that the magget was more than usually abundant-in fact, not so much so, and there were no such wholesale attacks of aphides as we have witnessed in some dry years. As far as my own culture is concerned, I have had no occasion to use a syringe to rid the plants of them. After the first floweringtime was over, we looked with some degree of doubt to the condition of our plants. I am speaking only of dwarfs, as most amateurs now grow them; there seemed to be little of that pushing out from the base on which we depend for next year's shoots. But when the rains came, it was marvellous what a difference soon showed itself, and how rapidly the plants became filled with vigorous and healthy shoots. This has gone on, and along with it we have been able to gather excellent blooms, especially

of Teas. Thus, one grower writes to me:—"I have cut to-day a dozen blooms of Souvenir d'Elise Vardon, which I should not be ashamed to put up in the height of the Rose season."

THE EXHIBITIONS.

Turning now aside from the general condition of Roses in our gardens to the exhibitions which have been held, specially those of the National Rose Society, it was seen how largely the character of the season influenced them. There was no standing in rapt astonishment before stand after stand of blooms of unparalleled excellence, for such were not to be seen; nor, indeed, were there many individual blooms of surpassing merit. The great Rose teurnament, held by the National at the Crystal Palace, is that which excites the keenest interest, and most clearly shows the character of the season; and here one heard on every side complaints, both of the number and the quality of the blooms exhibited, and the general verdict was unfavourable - and this, although exhibitors came forward from all parts of the country, and England, Scotland, and Ireland, were well represented. As might have been expected, the north had a good time of it, especially amongst the nurserymen; but as far as amateurs were concerned, the advantage did not lay so much with the northerners. The record of one southern grower, the Rev. Joseph H. Pemberton of Havering, near Romford, being very remarkable: he began with Colchester in June, and ended with Leicester on August 4, during this time attending at a dozen shows, he carried off most of the principal prizes for amateurs, among them being the two challenge trophies of the National Rose Society, the Mayor's Cup at Colchester, the Sutton Cup at Reading, the Challenge Cup at Croydon (finally won), and Challenge Cup at Woodbridge, beside two Gold Medals and four Silver, the Gold Medals accompanying the challenge trophies. Messrs, Harkness & Sons amongst nurserymen have made a remarkable record also, having won the two challenge trophies.

NEW VARIETIES.

Of new Roses there has been a scarcity, especially as regards those raised abroad; in fact, I do not recollect one for the present season that has made any impression as a Rose likely to be a great favourite in future years. The Gold Medal of the National Rose Society was awarded to a sport, not a seedling, exhibited by Messrs. Alexander Dickson & Sons. There are still some Roses much to be desired to which we seem to be no nearer. We should like to see a white A. K. Williams or Charles Lefebyre; and a yellow hybrid perpetual with more claim to that title than Gloire Lyonnaise, which was sent out under that misleading name. There does not seem to be any diminution of the interest in Rose growing or Rose exhibiting. Societies rise and fall. Exhibitors pass away or grow tired of it, but still the interest in the flower does not seem to flag. There is but one other flower which exceeds it in these respects, that is the Chrysanthenium; but beautiful, varied and valuable as this is, especially owing to the time of year at which it is in full beauty, it can bear no comparison with the Rose-moreover, it must be flowered to get it in perfection under glass, which is not the case with the Rose,

THE ROSE AND FLORAL DECORATION.

I do not think that the attempts to make use of the Rose for decorative purposes have been very successful at our exhibitions. It may be, and I think probably is, that the time is too limited to enable exhibitors in other classes to pay as much attention as they might do to this matter; or is it that the Rose is hardly adapted for grouping? It may be heresy to write this, but I think most ladies feel it a difficulty when Roses are brought for indoor decoration. The houquetists of Paris are supposed to excel all others in the elegance of their arrangements, but I well remember many years ago when the directors of the Crystal Palace Company were auxious to procure some of the best examples from Paris, the woeful disappointment experienced at the lumpy, mop-like eharacter of the arrangements sent by some of the leading houses who were in the habit of supplying the ladies who frequented the brilliant court of Napoleon III.

Such then is the record of what has probably been the most disappointing season ever experienced by Rose-growers; after a mild winter, in which no losses were experienced, and Roses broke well with the promise of great excellence, our variable climate exerted its power, and failure was anneunced on every side. Let us hope that better times are in store for us, and that while the energies of our Rose-growers continue undiminished, their efforts may be rewarded in 1897 by a more congenial season. Wild Rose.

NEW OR NOTEWORTHY PLANTS.

L.ELIO · CATTLEYA × VELUTINO · ELEGANS (Cattleya relutina ; L.-C. × elegans 3), new gard, hyb.

This pretty hybrid, which recently received a Firstclass Certificate of Merit at Paris, is the latest novelty produced by that indefatigable Orchid hybridist M. Chas. Maron, Orchid grower to M. Fonrnier of Marseilles. The plant, so far as it has yet developed, resembles in growth a stout form of Cattleya veluting, and the pretty and fragrant flowers, which are produced several together on upright spikes, bear a striking resemblance to those of a good form of Cattleya Schilleriana. The sepals and petals are of a creamy-white tinged with nankcen-yellow, and veined with rose; the showy labellum, which is blush-white at the base, has the side lobes folded over the column; the broad front lobe is of rich crimson purple veined with white, and having an orangeblotch at its base, and a toothed and crimped margin. James O'Brien.

A WILD BANANA OF NEW GUINEA.

In the tenth volume of the Proceedings of the Linnean Society of New South Wales, p. 348 (1885), the late Mr. N. de Miklouho-Maclay alluded to a Musa from New Guinea "with fruits containing very large, irregularly-shaped seeds (about 10 mm. long and 11 mm. in diameter), which, when ripe, are of a brilliant black colonr, and are greatly used by the natives as ornaments." In the same volume, p. 356, the writer of these remarks offered from personal inspection fuller notes on these seeds, and gave then to this species the name of M. calesperma, and an account of the Papuan M. Maclayi was also given. In a letter written in Sydney on September 4, 1885, the distinguished Russian naturalist mentioned (here translated), "Musa calosperma seems to occur only sparingly on the Maclay coast, that part of the north coast which stretches from Cape Croisilles to Cape King William), but is said to be very frequent near the south-eastern point of New Gninea and on the Louisiade Archipelago." Towards the end of last year Sir William Macgregor saw, 35 miles up the Mambare river, this same Musa. In ref. rence to this His Excellency writes me under date, December 15, 1895:-"I had a specimen brought on board the Merric England, where I invited Mr. W. Fitzgerald to study it. He undertook to send you his description of it. I enclose a sketch of the fruit by Mr. Winter. The bunch of fruits would have weighed nearly I cwt. It is not edible; the

Fig. 61.—Erythronium hartwegi: colour of the flowers white and yellow. (see p. 362.)

seeds are used for making beads. It is a fine handsome plant."

From Mr. Fitzgerald's notes, forwarded by him from Cooktown on February 7, 1896, and now given with some alterations in the organographic words, I extract as essential the following:—"I did not collect the specimens of the Banana, which grows on the Mambare river. Mr. Butterworth, on the request of Sir William Macgregor, brought a spike on board. Height 15 to 25 feet; stem stout; leaves 8 to 10 feet in length, 2 to 3 feet across; spike (thyrsoid raceme) pendulous, 3½ feet long by the same (in largest) circumference (as regards the fruit masses seen); bracts broadly ovate (very acute, according to Mr. Winter's delineation), 9 to 12 inches long, bright green.

Flowers numerous, \(\frac{3}{4} \) to 1 inch in length, white, the lobes of the calyx firm, linear, with sharply-recurved margins; corolla-lobes small, membranous; stigma trifid; fruit about \(\frac{3}{4} \) inches long by \(\frac{1}{2} \) inch in diameter, outside pale yellow; pulp whitish, streaked with purple. Seeds \(\frac{24}{4} \) to \(\frac{28}{4} \); testa bony, black. Albumen meally, bitter. The fruit is not eaten by the natives, and is known to them by the name of Tubi.

From a necklace made of these seeds, and transmitted by the Lieutenant-Governor, it may be added, that the seeds attain the length of half an inch, and are often semi-ovate in form. The necklaces are called by the natives Gudugudu. Mr. Wiuter's drawing tof much reduced size, indicates the flowers and fruits forming a total mass of ovate-conic form with crowded bracts.

Musa Fitzalani, as here recognized, differs from M. calosperma in the comparative pancity of its flowers, at least within some of the bracts, and in pulpless fruits with much smaller seeds. M. Hilli, which through Mr. Berthoud is now known also from the Johnstone River, is more widely separated by still more gigantic size, by a raceme erect, at least, during flowering time, as well illustrated by Sir Joseph Hooker, in *Estanica' Magazim*, t. 7,404 (1895), by its longer and less acute bracts, by yellowish flowers, by proportionately broader fruits with yellow pulp and smaller seeds.

M. Seemanni (tiardeners' Chroniele, third series, vol. viii., p. 182 [1890], with a woodcut from a photograph by his Excellency Sir John Thurston) belongs also to the series of species with erect inflorescence, but may perhaps be identical with M. Fehi of Tabiti and New Caledonia, as suggested in the Kew Index. I have not succeeded in identifying M. calesperma with any of the thirty-five congeners recorded by Mr. Baker in the Annels of Botany vol. vii., and in Mr. Dyer's Kew Bulleton for 1894. Should this Musa on further access to ampler material prove specifically distinct from Mr. Maclay's plant, then it should bear the name of Sir William Macgregor.

Attention may here be drawn at this apt opportunity to a Musa of extraordinary ornamental value, to which Dr. Warburg refers in Professor Engler's Julia Bucher, xiii., 274), with totally red leaves, cultivated by aborigines in New Britain, but indigenous to the Solomon Islands. It may only be a variety of some well-known species, but is not to be found in Australian gardens. Feed. con Mueller K.C.M.G., M. a Ph.D., LL.D., F.R.S.

THE GENUS ERYTHRONIUM.

Tuts genus of liliaceous plants is chiefly known perhaps from its only representative on this side of the Atlantic Ocean, viz :- E. Dens canis, commonly known as the Dog's tooth Violet. There are at present not more than a dozen species altogether known to botanists, and with the exception of E. dens-canis, these are natives of the United States and Canada. Small though the genus be, it has not failed to give a certain amount of trouble to betanists so far as identification and nomenclature are concerned. Dr. Sereno Watson in the Proceedings of the American Academy of Arts and Sciences (vol. xiv., 1878, p. 260, vol. xxii., 1886, p. 479), and Mr. J. G. Baker of Kew in the Journal of the Linuxan Society (vol. xiv., 1875, p. 296), and in the columns of the Gardeners' Chronicle have both grappled with the genus, but nowhere I believe has a complete monograph been published at one time. An attempt to do this has been made in the following notes, in the hope that such will be of interest to readers of the Gardeners' Chronicle. As the species do not appear to admit very readily of a natural classification (except perhaps by means of the stigmas), they have been described in alphabetical order for the sake of convenience.

1. E. albidum, Nutt.—This species is a native of the wet pastures of New York and Pennsylvania, extending to Minnesota and Texas, and flowers during April and May. The corms are ovoid and stoloniferous. The leaves are oblong-lanceolate, slightly or not all mottled. The peduncle hears a solitary white or bluish-white flower, the lanceolate reflexed segments of which are 1 to 1½ inch long, without auricles at the base. Style slender, stigmas somewhat spreading.

E. bracteatum, Bigelow, is considered to be a closely related form. It has somewhat larger leaves, and differs, moreover, in having yellow flowers, and being a native of the mountainous regions.

2. E. americanum, Smith.—This species extends from Canada to Florida and Texas, inhabits wet meadows, and produces its flowers in April and May, like E. albidum. It was introduced early in the present century to England, and in 1808 was figured in the Botonical Magazine, t. 1113, where it is stated to have flowered with Messes. Loddiges, of Hackney. The corms are ovoid and stoloniferous as in E. albidum, but the leaves are usually not only larger than those of that species, but they are also mottled with greenish-purple. The solitary flowers are clear yellow, the segments often having reddish-brown dots at the base, while the stigmas are undivided.

3. E. citrinum, S. Watson.—This is a comparatively new species, having been discovered in 1887 by Mr. T. Howell in the Deerbreek Mountains, Oregon. As indicated by the specific name, the colour of the flowers—three of which are usually borne on the peduncle—is lemon-yellow. There is, however, a broad orange-coloured blotch near the auricled base of the segments, while the tips are often suffused with a tinge of pink.

4. E. Dens-canis, Linn. This is the only species native of the Eastern Hemisphere, and is, of course, well known to almost everyone as the common Dog'stooth Violet. It is found wild chiefly in Central and Southern Europe, although forms of it extend across Asia to Japan. The corms are ovoid, cylindrical, and furnished with a more or less membranous tunic. The ovate or oblong-lanceolate leaves are glaucousgreen, marbled with dull purple. The peduncle bears a solitary flower, rose or violet-purple (rarely white), with brown dots at the base of the recurved segments, the inner whorl of which is provided with basal auricles. Stigma trifid. This species has been in cultivation for more than a century, and was figured in the Botanical Magazine in 1790, t. 5. Two very distinct forms are figured in Smeet's British Flower Garden, 2 ser., tt. 71 and 76.

Besides the white form, there are two other varieties of E. Dens-canis, viz., (a) sibiricum, a more robust form, from the Altai Mountains; and (b) japonicum (Baker), a Japanese form with violet-purple flowers, having a distinct blackish spot at the base of the petals.

5. E. grandiflorum, Pursh.—This was figured in the Gardeners' Chronicle, in June, 1874, p. 831, in connection with some interesting remarks from the pen of the late Mr. Andrew Murray. E. grandiflorum is a native of Oregon and Washington Territory. About 1827 or 1828 it was discovered by David Douglas (who was despatched to that region by the Royal Horticultural Society), and it seems to have flowered at Chiswick for the first time in cultivation about 1835 or 1836. The corms are elongate-ovoid, bearing oblong-lanceolate unmottled leaves, 4 or 5 inches in length. From one to six flowers are borne on the peduncle; they are white or cream-coloured, with a more or less orange zone at the base. Stigma trifid.

There are apparently many forms of E. grandiflorum, and so far as published particulars go, not a little confusion seems to exist as to their identity. The form figured in *Potanical Maga: inc.* in 1868, t. 5714, as E. giganteum, and in *Chartenflora*. 1873, t. 767, seems

to be the same as the variety known as albiflorum. It was collected originally by Douglas, in Califoroia, at an altitude of 6000 to 10,000 feet, and its large white flowers, with yellow base, seem to be the largest and handsomest of the genns. The leaves—unlike those of the species proper—are mottled with dull purple. The variety minor is indigenous to Utah and Colorado, and is distinguished by its smaller yellow flowers and crimson stamens. It is figured (as E. grandiflorum) in the Bot. Reg., t. 1786, and Bely. Hort., xxvi., 109, t. 6.

6. E. Hartwegi, S. Watson.—This species is named in honour of another of the Royal Horticultural Society's collectors-Theodor Hartweg. He collected it on the mountains near Sacramento about 1836. The late Mr. Bentham, however, in his Planta Hartwegianae, published in 1839, simply refers to it as E. grandiflorum, Pursh. : but Dr. Sereno Watson, in the Proceedings of the American Academy of Arts and Sciences, xiv., 261, describes it as a new species. Several specimens of it were shown at the Royal Horticultural Society's meeting on March 25 last by Messrs. Wallace & Co., of Colchester. The illustration (fig. 64), which was made from one of them, will give an idea of the habit of growth and size of the flowers. The upper surface of the green leaves is marbled with dull purple. The flowers are, as a rule, solitary, but two or even three may be produced on the same peduncle. They remain in good condition for three or four weeks. The segments are cream-coloured, with a more or less orange zone at

7. E. Hendersoni, S. Watson.—This distinct species was discovered in 1887 by Messrs. L. F. Henderson and T. Howell in Oregon, and is named in compliment to the former. It has oblong tunicated corms, and oblong duil green leaves faintly mottled with purple-brown. One or two flowers are produced on the peduncle; the reflexed segments are pale purple with a very dark purple base surrounded by a tinge of pale yellow, the inner segments being shortly clawed and auricled, and the filaments are coloured light purple. Figured in the Bot. Mag., 1888, t. 7017.

8. E. Howelli, S. Watson.—This species was discovered about the same time and place as E. citrinum and E. Hendersonii, by Mr. Howell, whose name it bears. It is said to bear a resemblance to E. Hendersoni, and there seems to be a doubt as to whether the surface of the leaves is plain or mottled. The petals are more or less of a pale pink tint, with a deep orange-coloured spot near the base. The inner petals have scales or auricles, and the stamens are white.

9. E. propullians, A. Gray.—This species is a native of Minnesota, where it was collected by Mrs. Hedges and Miss Darlington. The corms are small, ovoid, and stoloniferous, and the oblong lanceolate leaves are slightly mottled. The one-flowered peduncle is only 2 or 3 inches long, and the flowers are rose-purple, with a yellow base; stigma undivided.

10. E. purpurascus, S. Watson. — This species differs from all the others (except, perhaps, E. grandiflorum) in that its peduncles carry from four to a dozen flowers in a sub-umbellate raceme, instead of the normal one or two. They are in colour pale yellow, tinged with purple, and have a deep orange base. The corms are 1 to 2 inches long, producing somewhat large undulate leaves.

E. revolutum, described by Mr. Baker in the Gard. Chron., Jan. 1876, p. 138, is probably the same as the E. revolutum, Sm., and E. grandiflorum Smithi, Hook., and seems to be a slender one-flowered form of E. purpurascens. Specimens were collected in Nootka Sound by Menzies, and the flowers are said to be large, tinged with purple or rose.

E. multiplorum, Torrey, seems also to be referred to E. grandiflorum and E. purpurascens, but it is probably a variety of the latter, on account of its undivided stigma. It has mottled leaves, and the penduncles are said to bear as many as fifteen flowers at a time, these being in colour bright lilac with a vallow base.

A plant named E. Johnsoni was shown at one of the Royal Horticultural Society's meetings early this year (1896) by Messra. Wallace & Co. 1t has rose-coloured flowers, but does not seem to have yet been determined as a distinct species.

Growers of these pretty border-plants may be interested to know that most of the species described above will probably be in cultivation very shortly, as I believe Messrs. Wallace have received consignments of them from their collector in the United States. For the sake of arriving at a correct nomenclature, let us hope that it is so. John Weathers, Asst. Sec., R.H.S., London.

KEW NOTES.

BUDDLEIA VARIABILIS .- Information is asked with regard to a plant under this name in the collection of Mr. Gumbleton at Belgrove, Queenstown (see Gardeners' Chronicle, p. 301). The true plant of that name is a Chinese species, described by Mr. Hemsley in the Linnwan Society's Journal, vol. xxvi., p. 120, from specimens collected in China by Dr. Henry, and is a large shrub with quadrangular branchlets, narrow, lanceelate, toothed leaves, from 2 to 12 inches long, and rose or yellow-coloured flowers in cymcs. So far as I know this plant is not in cultivation. But this name has also been erroneously given to an African species, introduced from Natal to Kew in 1894, and described in the Krw Bulletin, 1894, p. 389, under the name of B. pulchella, by Mr. Brown, who says it is very distinct, and unlike any other species in the genus, its leaves being small, very variable in shape, but mostly hastate, glaucous green, the flowers in branched panicles, small, white with a yellow eye, and strongly scented. It forms a somewhat straggling shrub at Kew, where it is grown in a pot in the open air in summer, and wintered in a cold frame. It flowers freely in October.

POLYGONUM BALDSCHUANICUM.

This is an elegant free-flowering climber, which we owe to Dr. Regel, who introduced it from Bokhara, in Turkestan, in 1884, when it was described and figured in Act. Hort. Petrop., viii., p. 684. A plant of it was sent to Kew last year by Professor Max Cornu from the Jardin des Plantes, Paris, and it is now to be seen in the collection in the herbaceons ground, where it has scrambled over a cluster of pea-sticks, forming a Bindweed-like mass of long, thin stems, clothed with cordate leaves, 2 to 4 inches long, and terminating in long branching, elegant panicles of pink-tinted white flowers. It stood the cold of last winter without protection. As a trailer, it promises to be a plant of considerable usefulness. The Polygonums are particularly attractive at this time of year, and some of them form such grand specimens if planted on lawns, one wonders that they are not more often thus employed in gardens.

HELIOPHILA SCANDENS.

An example of this pretty greenhouse creeper may now be seen flowering freely in the succulent-house at Kew, where it is trained along a rafter at the cool end of the house, the shoots hanging loosely and bearing narrow lanceolate leaves 2 inches long, with numerous terminal racemes of white flowers, something like those of Erysimum, to which the genus is related. It scandens is a native of Natal, whence it was introduced to Kew about ten years ago, but it has never been so decidodly attractive as this year. About sixty species of Heliophila have been described, all of which are natives of South Africa.

DIMORPHOTHECA ECHLONIS.

This plant is now flowering freely in the open air at Kew. It has grown vigorously throughout the summer, but has flowered somewhat shyly until lately. It may be called a sub-shrubby form of D. annua, with flowers nearly twice as large. Whether it is really perennial, as stated by Cape botanists, remains to be proved; in any case, it is worth growing as an autumn-flowering Composite. The flowers are not unlike those of a Paris Daisy, but the disc is purplish, as also is the lower side of the ray florets.

Brunsvigias.

Two species of this genus of South African bulbous plants are now in flower in the Cape-house at Kew,

viz., P. Josephine and B. gigantea. There is not much difference between them, the former being, however, larger in all its parts, the umbel of flowers twice as large, and the colour deeper. These plants flower rarely in this country, but the excessive amount of sunshine of the past summer appears to have favoured them, as I have heard of several others flowering lately beside those at Kew. They are very attractive, glorified Nerines one might call them. B. Josephine

original Amaryllis ornata of Aiten, and to have been cultivated at Kew over one hundred years ago. It has small, globose, purplish, short-necked bulbs, thin leaves about 1 foot long and 1 inch wide, a slender peduncle of the same length, bearing several flowers with a slender curved tube 5 inches long, and a limb 4 inches wide, consisting of oblong-acute segments, white faintly tinged with red along the mid-rib at the back. It comes very near C. Sanderianum, a native

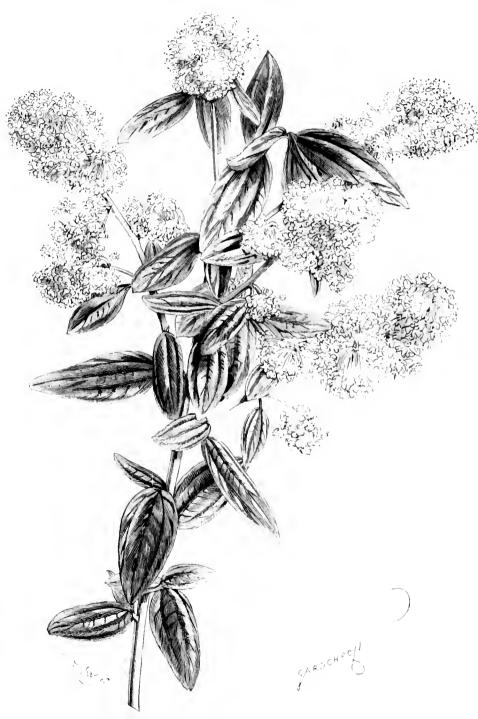

Fig. 65.—CEANOTHUS THYRSIFLORUS: COLOUR OF THE FLOWERS DELICATE BLUE.

has a scape 18 inches high, bearing an umbel of about fifty flowers, each of which has a stiff pedicel one foot long; the flowers are 3 inches long, the segments of which are reflexed, and coloured bright red. Eight other species have been described, but so far as I know none of these is in cultivation. The genus has been crossed with Amaryllis, and there are good reasons for believing that it would cross with Nerine.

CRINUM YUCCEFLORUM,

Plants of this Crimum from Sierra Leone are now flowering in the stove at Kew. It is said to be the

of the same region, but the latter has wider leaves, and is a sturdier and more ornamental plant. Examples of it are also in flower at Kew, as also of C. angustum, C. asiaticum, C. Hildebrandti, C. giganteum, and C. Mooreanum, W. W.

NOTES ON CEANOTHUS.

CEANOTHUS THYRSIFLORUS, Eschscholtz.—The illustration (fig. 65) is reproduced from a photograph taken April 11, 1896, in the Botanic Garden of the University of California, at Berkeley, California. The tree

from which the branch was cut a five years old, is about 12 feet, high, with a spread of 10 feet, and has a stem 3 inches in diameter; the thyrses range from 21 to 5 inches in length. This species is figured in the Botanical Register, xxx., t. 38, from a specimen in the Royal Horticultural Society's garden, raised from seed sent from California by Hinds while on the Sulphur voyage; the thyrses as there figured are much less densely flowered than is usual with us. The plant seems to have gone out of cultivation in England, as there is no mention of it in Nicholson's Dictionary of Gardening; it is, however, certainly well worthy of re-introduction, for no flowering shrub can be more effective when well grown. The colour is unique, a delicate blue, only very indifferently represented in the Botanical Register, fig. xxx. In its native wilds it grows best on northern slopes or in cool ravines.

Another handsome species now flowering with us is C. foliosus, Parry, of a more northerly range than the last, with smaller inflorescence, and of a much deeper blue colour. This shrub has a low, spreading habit, the more erect stems being rarely over 3 feet high, but producing many long spreading branches from the base; these sometimes covering an area 15 feet in diameter. When completely covered with blossoms, this plant is very effective on a northerly bank. It does not appear to be known in England.

C. lievigatus, Hook., now just coming into blessom here, is a species from yet farther north, and is remarkable for its large leaves, dark green above, pale beneath, with a heavy cinnamon odour; these sometimes attain a breadth of $2\frac{1}{4}$ inches, and a length of $3\frac{1}{4}$ inches. The thyrses are large and showy, of a yellowish-white colour. I have not seen it in its native wilds, but in the garden it maintains a bushy habit.

As an ornamental species, my preference is for Ceanothus Parryi, a beautifully-flowered shrub from 6 to 10 feet high, with a more bushy habit and smaller leaves than has C. thyrsiflorus, and deep blue-coloured flowers. This species is closely allied to papillosus, but was described as distinct by Professor Trelease in 1888. J. Burtt Davy, University of California.

TREES AND SHRUBS AT FOTA.

A RIDE of a few minutes' duration by railway from either Cork or Queenstown brings the traveller to the private station of Fota, and a word or two explaining the object of the visit to the station-master secures the traveller admission to this jealously-guarded and secluded domain.

The island forms only a small portion of the landed possessions of the Hon. A. H. Smith-Barry, M.P., a descendant of the ancient house of the Barons of Barriemore. The Castle of Barriemore has long been in ruins. The residence at Fota is a rambling sort of mansion, with few, if any, architectural pretensions; but the island on which it stands has much to recommend it in the eyes of some persons, in its utter quietude and retirement from the press and stress of the world outside, for being cut off from the mainland by water, visitors are few.

The climate, like that of the whole district, is mild and humid, and to many persons decidedly relaxing in its effects; and if it does not form an ideal abode for man, vegetation from milder climes than our own succeeds admirably. The plants of the warm temperate parts of the world, as Australia, Japan, the northern island of New Zealand, Chili, and Pern find here a congenial home, growing with vigour to a large size. A gardener seldom finds any difficulty in getting access to a brother of the craft, and a few words of introduction sufficed to put us and Mr. Osborne, the head gardener, on an amicable feoting, and we were soon engaged in the agreeable occupation of examining the beauty of tree and shrub in the extensive pleasure-grounds. It may be here stated, that there is an outer belt of plantations near the shores of the island, and an inner one surrounding the pleasure-grounds and gardens, both of these belts, which are of considerable depth, and consist of common species of timber-trees and evergreens, serving as windbreaks and screens. The island is almost flat, and but little elevated above highwater mark; indeed, on one occasion, a good many years ago, the sea broke through, causing consider, able damage among the trees and shrubs.

Our way led by a straight walk, bounded on either hand by tall Portugal Laurels, Quercus llex, and other trees; and here on the broad margin of turf were noted plants of Azara microphylla, 24 feet in height, and as much in diameter. It is here a most desirable evergreen shrub; the flowers are green and fragrant, and numerously produced in the spring. Eugenia apiculata, a once common greenhouse shrub in English gardens, and still largely grown on the Continent, and which might well take the place of the common large-leaved Myrtlein large greenhouses, being a faster grower, and bearing cutting better, was flourishing in this part of the grounds; one example measuring 8 feet in height, and almost as much in diameter, was noted. A specimen of another inmate of the greenhouse, and one not often seen nowadays, even there. Fabiana imbricata, formed a large bush, and near by it was a very fine example of Chamærops excelsa, planted twenty-seven years ago, which was quite uninjured by the frests of 1894-95: it is about 15 feet high. Veronica Traversii robusta formed a splendid bush, which, in its season, is covered with a profusion of blue flowers. It is one of the handsomest of the genus, and may safely be trusted out in the neighbourhood of London.

A tree of Benthamia fragifera measured 40 feet in diameter, and was laden with fruits at present unripe; not far distant from this bandsome and rare object was remarked a fine half-tree of Embethrium coccinea, and one of Cornus (Viburnum) brachypoda, syn. C. macropbyllum, a pretty Japanese species, succeeding only in the warmer parts of Britain. The tips of the shoots were just putting on their autumnal colouring of rosy-red, giving the plant a very attractive appearance. It is as remarkable a shrub, but in a different way, as are Colletia cruciata and C. spinosa. The firstnamed Colletia was a plant forty years old, and 10 feet high and broad. Leptospermum grandiflerum is a strong-growing white-flowering bush, although it was killed to the ground in 1894, as was also a bush of L. lanigera. Close by these shrubs there is growing the largest specimen of Hex cornuta in Britain; it measures 7 feet in height by 7 feet in breadth. Another fine thing was Glyptostrobus sinensis pendula. In this part of the grounds most of the Japanese Conifers are represented.

The pond with an island, planted with gigantic Thamnocalamus 18 and 20 feet high, and several other species of Bamboos; on the margin of the lake several varieties of New Zealand Flax and Gunnera manicata; and the surface of the water all a-flower with Nymphæas, including M. Marliae's handsome hybrids, and N. Leydeckeri, and others, is a feature that imprints itself on the memory. Chamærops excelsa, Enlalai japonica, Arundo Donax, and giant grasses, form some of the surrounding vegetation of the lake, and the whole, not being in the least bit trim or too gardenesque, had a remarkably natural tropical look. The handsome large-leaved Berberis nepalensis grows into a big bush, as do Salvia leonuroides (formosa), of which a vigerous plant was remarked with searlet calyces to the flowers, of which many remained; and Tracheleosporum Jasminiflorum. A bush of a species of Edwardsia grows and flowers well in the open. Many species of Pittosporum in variety are planted about the grounds in sheltered spots; and one of the pretty P. undulatum, forming a perfect columnar example, has grown to 20 feet in height. It flowers freely in the spring, but the flowers drop without setting, as we observed no seed-vessels on the plant. A comparatively immense tree of Arbutus Andrachne, with the peculiar flattened and channelled limbs, and stem of a reddish colour, was remarked. So large a tree as this one must, we should imagine, be extremely rare in British gardens.

Conifers are, however, the chief glory of Fota, so many fine specimens of the tenderer species, as well

as those capable of enduring the hardest frosts experienced in these islands, abounding. The beautiful trees, which stand in a kind of orderly confusion, and at, in almost every case, sufficiently wide distances apart as to secure perfect development, with the softest and greenest turf below them as a fitting setting, could not fail to please the most exacting critic. Here there are no cruel frosts to kill and maim, and the only dauger to be feared is snow. And we all knew how carefully-tended garden trees with their long and wide spreading branches, collect the snow when it falls heavily and without wind, until its weight is too much for the branches to carry.

An example of Thuia borealis (Nutkaensis) compacta, a lovely variety with finely cut foliage, and baving a height of 40 feet, and a Sequoia sempervirens, 60 feet high, with a stem 9 feet in circumference, have few equals.

Abies Albertiana is a fine large tree, beautifully proportioned; a good example of A. brachyphylla, and one of the rare A. Pinsapo var. glauca, with blue-green needles, were noted. A still more rare tree was a splendid Pinus Devoniensis (Montezumæ), 40 feet high and browl. The grey-green colour of the long needles, and the peculiar growth so different from other Pines, stamp this a first-class tree for planting in mild parts of the country—in all others it is always unsatisfactory.

Of Cryptomerias there are several species and varieties, and all of them do well. A fine large specimen of C. japonica spiralis, in which the needles coil tightly round the young shoots; C. j. Sandersii, which originated in Cork, and has pretty foliage and a dense habit of growth; beside the type C. japonica and C. clegans, were remarked. Abies Webbiana has grown into a beautiful specimen of large size, and it bears cones freely. A tree of Cedrus atlantica glauca, a seminal variety, has reached a height of 60 feet, and proportionate breadth.

Of Picea religiosa there are two trees near to each other, and 70 feet in height, perfect specimens; the one with glaucous green foliage, the other of the normal green tint. In the cones no difference can be detected. Splendid examples of Abies grandis and A. Nordmanniana were noted. The reputedly tender and rare Cupressus Lindleyana formed a well-furnished tree, 45 feet in height. Another "biggest tree of its kind in Britain," is a Cupressus macrocarpa—a faultless example.

Of miscellaneous species of trees, mention may be made of a form of biriodendren tulipiferum contertum, 20 feet high; of a large example of Pterocarya caucasica, of Eucalyptus coriaceus (E. amygdalina of some botanists), whose stem at the base measures 7 feet in girth, and whose total height is 50 feet. The tree was once somewhat injured by the removal of some trees which sheltered it, but it has now quite recovered its health.

A large hardy Fernery exists in the garden, and is very well furnished with choice species. We observed Lomaria chilensis, a fine evergreen species; Balantium culcitum, also evergreen; Cyrtonium falcatum, Woodwardia radicans, the latter with fronds S feet in length, and which propagates itself freely on the rockery from bulbils; and Dicksonia antarctica, many fine specimens, from 5 to 15 feet high, with a spread of fronds of 14 feet.

Fota is furnished with extensive kitchen-gardens, excellent fruit-walls, on which very excellent fruits were noticed: numerous modern-built glasshouses, which are well filled with useful kinds of plants; and everything in and about the gardens bears the stamp of the numerous cultivator, and man of taste and liberal ideas. Mr. Osborne has, we believe, held the post of head-gardener to Mr. Smith-Barry for the lengthened period of twenty-nine years, and he has therefore had the satisfaction, rare in these days of change, of tending to the needs of the rare species of tree and shrub from the time most of them were planted, and seeing them arrive at their present size.

THE SEED TRADE.

THE GRASS AND CLOVER CROPS.—Our customary advices from Germany in reference to the actual and anticipated crops of Grass and Clover seeds show

that the yield of the former has been, on the whole, smaller than that of last year, and some kinds have disappointed the expectations of the early summer. The two leading kinds of Agrostis-the fine and the Marsh Bent-grasses, promise exceedingly small yields in the United States, as well as in Germany; and as dealers sold out pretty closely last season, prices are likely to be high. Aira flexuosa (Hair-grass) has been harvested in small quantities, all of which are more or less discoloured by rain. Alopecurus pratensis (Meadow Foxtail) has given a satisfactory yield, but as the stocks on hand were largely exhausted early in the year, prices will rule as high as last season. The quality of the seed is exceptionally fine, and it is of a high degree of purity, and the growth is expected to be in every respect satisfactory. Anthoxanthum odoratum (Sweet Vernal-grass), and the form of it known as Pueli, show a yield considerably less than that of last year, but the sample is fine. Avena elatior (Out-grass), is good in crop and quality. Ductylis glomerata (Rough Cock's footgrass) is said to have proved a complete failure in the United States, and it would seem no imports can be looked for from thence. The New Zealand crop is medium, the seed heavy and promising. Prices are advancing owing to a large demand. France reports a good crop, but it is complaine I of the bulk that other grasses are mixed with it. Cynosurus cristatus (Dog's-tail-grass) is almost a failure, and prices are sure to be high.

The Sheeps and other bard Fescue grasses have greatly disappointed the expectations entertained during the earlier part of the season; but the weather became bad, and continuous rains spuiled much of the seed. A small yield is inevitable, and as considerable expense will be incurred in cleaning the seed, prices are certain to be high. The fine-leaved form (Festuca tenuifolia) grew badly in consequence of the autumn of 1895 being so dry, and this followed by the equally uufavourable spring of the present year, the yield is light, and has had to be thoroughly cleaned, thus raising its value in the market. F. pratentis (Meadow Fescue) shows a crop less abundant than last year, but in consequence of good stocks having been held over in some quarters, prices are likely to be lower than those of last year; the quality of the seed is excellent, though a little discoloured by rain. Tall Fescue-grass (F. elatior) saved in southern Germany is about one half the crop of last year, and will not cover the expected demand.

Holeus lanatus (Creeping Soft-grass) has given a good crop of satisfactory quality and high purity. Lolium perenne (Rye-grass), and L. italicum (Italian Rye-grass), have both been harvested in abundance, and prices are lower than these of last season. Phlenm pratense (Cat's tail or Timothy grass) has proved an excellent crop in the United States, and prices there are lower than for several years past; nothing appears to be known at present of the German crop. Of the meadow grasses, Pea nemo ralis has yielded a fair average crop, rain having affected it but little. Poa trivialis has a smaller crop than during the past two years, and the price has advanced. P. pratensis is a failure, and the present high prices are likely to advance. Phalaris arundinacea (Reed Canary-grass) is scarce, the dry spring having affected its growth.

All Clovers are expected to yield less seed than last year, though it is too early in the season to report with anything like accuracy. Sainfoin has produced an abundance of seed, but the samples are stained by rain. Trefoil has been harvested in small quantities only, and prices are likely to rise. White Clover gave a medium crop, but no fine samples have put in appearance in the market as yet. A large crop of Alsike has been secured in America; there the seed is very cheap. Trifolium incarnatum has quite failed in Italy, and a small crop only has been obtained in France. German and Austrian crops are good, and though the seeds are discoloured by rains, the seed grows remarkably well. In reference to red Clover and Lucerne, it is as yet too early to form a definite opinion, but unless the weather changes for the better, the crop is likely to be an indifferent one Pisum.

FOREIGN CORRESPONDENCE.

LATE TULIPS.

WE greatly approve of the editorial remarks (in your recent issue of September 19) ou the practice of giving Latin names to garden varieties. We have for many years protested against it, and those who were present at the first Daffodil Conferences will remember Mr. Krelage's, and others efforts in this respect. Especially the nomenclature of Tulips would become very annoying and confusing if this regrettable practice became universal. The origin of most garden Tulips is absolutely unknown, and it is very difficult to state whether Tulios generally known under well-registered botanical names are really the species described by their authorities. Many Tulips which first were described as original species have afterwards proved to be old garden Tulips, escaped from gardens louz ago, and found again growing wild. It is, therefore, of no use to give botanical names to any old garden Tulips which may have been re-discovered of late; appropriate fancy names are to be preferred, and will doubtless be approved both by nurserymon and amateurs.

The second point, referred to in *The Field*, and reprinted in your columns without any mark of approval or disapproval, should not be confounded with the condemned practice described above. The classification of rectified amateur Tulips has nothing to do with the giving of Latin names to garden Tulips. We are very proud to state that the catalogue to which reference is made in *The Field* is ours, and we are glad to have an occasion of defending our system of classification, which we shall certainly not abandon.

Late rectified amateur Tulips have for a very long period of time been a special feature in Holland, in French Flanders, and in England. The Dutch collections are the oldest; those in Fngland were especially renowned in the first part of the pre-ent century, and the Flemish collectors went their own way, and raised their best varieties about the same time. The development of Tulip culture in each of the three countries has its own story, and as, of course, no regular communication between the Tulip lovers of these countries existed to any exteut, the result was the formation of three well-distinguished strains of rectified amateur Tulips.

The Dutch strain, which was already renowned in the last part of the eighteenth century, did not improve very much in later years, but has always been kept by some of the Dutch nurserymen, who can still supply these varieties true to name.

The Flemish strain is distinguished by flowers which are very effective and beautifully coloured, but they do not exactly answer to the English Tulip rules. These flowers, which only include Violettes and Roses, but no Bizarres, are irregularly flamed and blotched, have not always a white base, and are as a rule, of longer shape than English Tulips. The English strain, which has of late revived to a great extent, thanks principally to the indefatigable zeal of Messrs. Barr and others, does not need further description in this paper. Each of these strains consists of different varieties, and there are only a very few which are to be found as well in the English as in the Flemish or the Dutch collections. The English Tulip collections contain the Dutch Rose Tulip, Heroiue, and others; the Dutch strain includes the Flemish Violet Tulip, Louis XVI., and so on. We have intentionally catalogued the three strains separately, in consequence of their distinct characters. Euglish Tulip collectors, of course, only allow the perfect English varieties in their gardeus, but other plautlovers, who do not grow these Tulips from the standpoint of the Tulip-fancier, but rather to enjoy their beauty, may prefer the Dutch and Flemish strains. This is, of course, a matter of personal taste only, but we, as growers, are obliged-so as to enable our customers to choose what they exactly waut-to classify late Tulips in a convenient and practical manner

The third remark, which in the Field is some-

what mixed up with the former, refers to the new strain of late self-coloured Tulips, which we have named in honour of the late Charles Darwin. This question may be considered as settled already, since the distinctness of this strain is so generally admitted, that the demand for "Darwin" Tulips now far surpasses the production. We do not like to be our own laudators in this question, but we kindly beg to allow to reproduce what your esteemed contributor, Mr. W. Watson, of Kew, said ou the matter two years ago, when the same question arose in the English horticultural press. This is what Mr. Watson then wrote in a Loudon letter to Garden and Forest :-(February 21, 1894)-" English horticultural papers are actively discussing these plants just now, some of them holding that the "race" recently named in compliment to the great naturalist, and offered by Messrs. Krelage & Son, of Haarlem, is not in any way distinct from thoold "Breeder" Tulips, which are forms of T. Gesneriana. In my opinion, there is a difference, the plants offered by Messrs. Krelage being much superior in colour attractions to the Breeders of English gardens. The former have been grown at Kew several years now, and their extraordinary colours attract considerable attention. No less au authority than Sir Frederick Leighton, on seeing them at Kew two years ago, expressed himself delighted with them, because they were so different from and so much more artistic in colour than the Tulips usually growu in gardens. If the quibbling over the name only leads to the general cultivation of these Darwin Tulips, it will have been productive of some good. I would rather call them Darwin than Breeder Tolips, even if they were identical, the latter name suggesting something unfinished or imperfect, whereas the flowers themselves are boautiful in their colours, kaleido-copic, never harsh or disagreeable to the eye, and often showing the most subtle blending of browns, and purples, and greens-in short, all colours. Breeder Tulips have never held a very promineut place in English horticulture - not within the last twenty years, at any rate; but, unless I am much mistaken, these Darwin Tulips of Messis. Krelage are certain to become favourite with all who love true beauty of colours in a flower.'

We may add, that the enormous demand for Darwin Tulips has proved the truth of Mr. Watson's prophecy. E. H. Krelage & Son, Haarlem, Holland, September, 1896.

FORMALDEHYDE.

REFERRING to the use of formaldehyde for preserving vegetable tissues, a subject which has been ventilated in the track-ners' Chronicle during the past month, I may now, perhaps, be allowed to give a few more details than I was able to do in my last communication. This substance is now known in commerce under the name of formalin, and appears as a water-white solution. In a small pamphlet on formalin issued by Schering, of Berlin, the following description of the substance is given.

Formalin is the name of a saturated aqueons solution of 40 per cent. of formic aldehyde (CH,O. Formic aldehyde is a gas prepared from wood spirit and other alcoholic liquids by oxidation. It dissolves easily in water, and is called in commerce formulin. It can be readily employed in any strength. For most purposes a solution of formalia, consisting of one tenspoonful of the fluid to one quart of water suffices. In many cases, however, a much more dilute solution is sufficient. It is an excellent lisinfectant and antiseptic, and is perfectly harmless. All kinds of food, such as meat, poultry, game, fish, fruit, &c., can be preserved by it. Fruit should be dipped in the formalin solution for about a minute. or wiped with a cloth moistened with it, in order to prevent external decomposition. As a preservative in which to keep fruits for museum purposes, a formalin solution of the strength here stated has, so far, been successful in preserving their substance and shape for a period of about two years, for it must be remembered that the substance is a comparatively new introduction. For preserving colours, however, the results are not in all cases equally satisfactory;

greens become chauged to a yellowish tint, while yellows and reds are the most successful, especially the latter. The splendid bright crimson of the fruit of Momordica cochinchinensis, after immersion for about two years, show but very slight change, the fluid it elf being only slightly tioged with yellow. In alcohol the bright-colonned, fleshy fruits, quickly lose their colonr, and become bleached; while in a saturated solution of salt-and-water the colours are fairly well retained for a year or two, after which the fruits themselves become soft and pulpy, and the colours, whether reds, greens, or yellows, have a faded appearance. The results then, so far as time will yet allow us to speak, are in favour of formalin. John R. Jackson.

DUDLEY LODGE, HARROW-ON-THE-HILL.

This is a garden which owes much to the artistic tastes of the owner, H. W. Bryans, Esq., who, during the few years he has resided there, has greatly altered it from the common type of lawn and border garden, usually bare of everything in the winter, and filled with "bedding plants" in the summer; to a pretty garden containing much variety, and one in which the botanist, florist, or the mere lover of flowers would be able to find much to interest and please. The alterations entailed much hard work, and a considerable amount of money. Numerous fine shrubs and herbaceous perennials were planted, which will, in the course of time, fully compensate the proprietor. At a short distance from the boundaries of the garden, raised banks have been thrown up, and planted at the top, and in places, on both sides, with flowering deciduons and evergreen shrubs. The outer side of these banks is skirted by a pleasant treeshaded walk, and in various parts, spring and summer flowering plants, such as Primrose Polyanthus, Forget-me-nots, Foxgloves, Saxifrages, &c., are planted so as to obtain some flowers both early and late. In the shade, clumps of Hypericum, Vincas, Ivies, and other suitable things, find a home; and the small-leaved Ivy is made use of sometimes to trail over spots where Lily of the Valley, Daffodils, and other bulbs are planted, which has, when these are in flower, a pleasing effect, and when the bulbs have died down, there is still a bright green carpet of Ivy instead of the bare soil.

Looking over the garden from beneath a rustic arch, and across the expansive lawn, Mr. Bryans' dwelling, climber-clar, comes into view; on one side a view over the surrounding charming landscape has been opened up, unobstructed by a light iron screen, to which are looped varieties of Clematis.

On another side of the house the front portion of the garden is shut off by a light wrought-iron screen, made from Mr. Bryans' design, and which a thin covering of Ampelopsis and other creepers decorato without quite concealing it. Beside it is a rosary, planted with a good selection of Roses, and around the entire garden runs a broad herbiceous border, varied to height, and undulating in outline.

When planting on so large a so de, the larger-growing species have to be planted in clumps, otherwise the effect produced is poor, especially when observed at a distance, hence the clumps of Hollyhocks, Phlox, Iris, Anemone japonica, both white aud pink; Delphinium, Gladiolus, Eryngium, and other showy borderplants, afford a constantly changing show of flowers. The brightest colours at present are obtained from varieties of Helianthus, Œnotheras, Lobelia cardinalis, Pyrethrum, and Potentilla, with here and there glowing Gladiolus, Tritoma Uvaria, &c. In planting the borders, the use of boliage for contrast in colour and form has been well considered, and clumps of Bocconia cordata, Eryngiums, &c., have been well and effectively placed. As an aid to the floral display, annual and biennial species are used whenever they do not interfere with the perennial plants.

In one of the recesses was observed a pleasing group of thinly-plauted shrubs, filled in with large specimens of Abutilons, which are still covered with bloom, the bed being finished with a broad edge of Calceolaria amplexicante.

The group is as pretty as any in the garden; and we were told that this sort of planting for summer effect will be carried out on a larger scale another season.

The Salvias have been very bright, and are so still. We remarked here Salvia patens whose flowers are of a handsome shade of blue, the neat S. Horminum with heads of floral bracts varying from pink to rich purple; a patch of hardy Heaths, and Menziesia polifolia in flower, and at other points some interesting objects. Here, as in other gardens, zonal Pelargoniums are being crowded out by hardier plants. Here some fine beds of Begonias put the Pelargonium to shame, at this end of the season. J. O B.

PLANT NOTE.

CHRYSOGONUM VIRGINIANUM.

In the new gardens of Aldenham House, Elstree, Mr. E. Beckett cultivates this plant in patches, which are very effective and charming at this season of the year. The generic name, Chrysogonum, is given, according to the Dictionary of Gardening, as being derived from two words—chrysos, gold; and gonu, a knee or joint; in allusion to that peculiarity of the plant of mostly flowering at the joints of the stem. It is of a somewhat dwarf and bushy growth, producing rather freely yellow composite flowers of a showy character. It seems to do well at Aldenhun House, both in the heavy soil of the new shrubbery beds, and in the lighter soil of the garden attached to Mr. Beckett's residence. It is a hardy herbaceous perennial, and makes a pleasing display when in full bloom. It is propagated by division of the roots in spring. The genus is said to include others, but the above appears to be the only one in cultivation, and is very seldom met with. R. D.

FLORISTS' FLOWERS.

THE AURICULA.

AURICULAS in pots appear to have stood the hot, dry weather without injury. I have seen several collections in different parts of the country, which are satisfactory in their present appearance. Probably the fears of cultivators caused more than usual attention to be paid to their wants. My own plants acquired a generous leafage during the fine weather, and they have not stopped growing yet, though the decay of the outer leaves shows that the resting season draws nigh. With cooler weather there has come less need for water, and as November approaches it should be sparingly afforded, and then only to prevent the soil becoming so dry as to cause drooping of the leaves. If this should happen, place the pot in water to ensure the ball being thoroughly moistened, and return it to the stage. If a plant be allowed to get dust dry, the younger root fibres perish, and of course an injury is done to the plants. I prefer to keep the soil fairly moist all through the winter, and then if the drainage be good and the soil sweet, no harm ensues; whereas, stagment moisture is always hurtful, and I quite understand why it was that the growers of a past generation, who had to winter their plants in a cold frame, used to insist upon the importance of having the drainage of the pots in good condition in the autumn. Some plants will, of course, die in the best-managed collections; "cracks" go down before the deathly visitant as well as the inferior types. Rarity affords no immunity.

Amateurs who possess only an elementary knowledge of Anriculas sometimes write in fear to impaire if the natural decay of the older leaves means coming death to the plant? Certainly not, if the plant is healthy and doing well; but if otherwise, if in harmful soil, then there is reason to fear further injury. An unhealthy plant manifests itself in the heaves looking weakly, curling at the sides or ends, and in a stoppage of its growth. Such plants need immediate attention, and the soil shaken quite away from the roots, which if examined will be found in

most cases to show signs of decay, or it will be found at the neck of the plant. It is often difficult to save a plant when decay is deep seated, and that is one of the reasons for having the plants at all seasons in places where easy inspection of them is possible. No plant suffers more from neglect than the Auricula, but on the other hand, it repays careful culture.

During the months of October and November the plants will gradually lose most of their leaves, leaving a filbert-shaped bud or crown. If the heart be plump, and the root-stem stout, then the spring may be looked forward to with hope, for the chances are all in favour of good growth and fine bloom. The Auricula is never without interest, even when at rest. It is well, however, to be as attentive to the plants in winter as in spring and summer, and no grower should grudge his plants this much. R. D.

TREES AND SHRUBS.

CORNUS SANGUINEA VARIEGATA.

Under this name we have growing here an ornamental variegated-leaved Dogwood 5 to 6 feet in height, which is very offective when seen in company of evergreen and decidnous shrubs. It succeeds in rather moist situations; and in winter, when the leaves—which have a silvery-white variegation—have fallen, the red colour of the stems and shoots is a pleasing feature.

SPIRMA ARLEFOLIA.

This pendulous white-flowered shrabby Spirae is one of the most attractive of the species flowering at midsummer; and as the planting season is now at hand, it is worth noting as being a valuable plant for the shrubbery border, or for planting as a specimen on the lawn or in the semi-wild garden, in either position it being a most telling object when in flower. The flowers are freely produced even on partially shaded plants, and when so grown the flowers are of a purer white than when growing on bushes fully exposed to the sun. It grows from 12 to 15 or more feet in height, and appears to flourish in almost any kind of soil. C. Herrin, Dropmore.

THE WEEK'S WORK.

THE KITCHEN GARDEN.

By CHARLES HERRIN, Gardener, Dropmore, Maidenhead

Lettace. — Plants from sowings made about the end of July will now be sufficiently advanced for tying up when dry. At this season of the year, Lettuces which in early summer fold-in and blanch without trouble, need to be tied up so as to obtain the desirable blanched heart. The seedlings from the sowings of Brown Bath Cos and other varieties which were made about the middle of August will now be large enough for transplanting to vacant spaces at the foot of south walls, after due preparation of the soil; and a larger batch be planted out in a part of the garden well exposed to the sun, which is moderately rich. After making the soil firm, proceed to plant the Lettuces in lines at 12 inches apart, and a inches in the row. If a garden-frame can be spared, place it on a hard bottom, and after spreading over the surface soil to the depth of 3 inches, make it firm, and plant Lettuces therein at 3 inches apart, to serve as a reserve stock of plants. The lights should be kept off the plants, except in excessively wet or frosty weather.

Endire.—Where sufficiently advanced in growth, the best may be blanched as required, by placing an inverted flower pot over the heads, or tying them up with matting when dry.

Herbs, -Sweet and bush Basils and Sweet Marjoram may now be pulled up by the roots and dried in the shade. Where green Basil is required, some of the smaller plants may be potted-up. Seeds should also be sown thinly in boxes forthwith, and placed in a warm house, where, when germination has taken place, the foliage should be kept dry to prevent "fogging" off. During the late drought Tarragon made but little growth, but since the rains set in has grown freely, and where it is much in request, a portion of the growths may be cut and dried for future use.

Miscellaneous Work, -Capsicums and Chilis, which have been growing in pots placed in cold frames up to the present time, should now be removed to a warm house to ripen their fruits. And if planted out in frames, the plants may be pulled up with the fruits attached, and hung up in a warm house to finish off. Dwarf early Peas are now podding, but the rainy weather has cansed mildow to become troublesome, rendering it very necessary to syringe the hanlm with soft-soap and sulphur in water, so as to check the spread of mildew. The hoeing of the soil has not been possible for some two or three weeks, and the growth of weeds has been rapid; and should the soil not be in a fit state for the hoe to be used, hand-weeding must be resorted to, etherwise beds of newly-raised Onions, Cauliflowers, Spinach, &c. will become greatly drawn or smothered with them. Weather permitting, Broccoli, Coleworts, &c. should be partially earthed up before the leaves cover the ground. Where Potatos that were interlined with these crops are still unlifted, they should be dug up as soon as possible. Slight frosts may now occur at nights, and the materials for protecting rows of dwarf and runner Beans should be got in readiness. For this purpose, canvas or mats be got in readiness. For this purpose, canvas or mats fixed to short stakes driven into the ground on either side, just level with the tops, answer well. Vegetable Marrows are fruiting freely now, and should be protected in some kind of way. Where Tomatos are standing in pots outside, remove them to a warm, ary house. Gather the fruits from those planted outside. of-doors as soon as they begin to colour, and place them in a warm, dry place to ripen.

PLANTS UNDER GLASS.

By Jno. McIntyrk, Gardener, Woodside, Darlington.

Bulbs and Plants for Forcing .- Make preparations for the foreing of bulbs and plants to provide flowers during winter. If a large quantity of flowers for entting be required, pot-up 200 or 300 bulbs of the common yellow Daffodil, as these 300 bills of the common yellow Daffodi, as these generally give a better return than almost anything else. If the bulbs be potted now, and for the next two months plunged in ashes, they may then be placed in a brisk heat, and will flower about the end of December. Eight or ten bulbs may be put into each 5-inch pot, and the compost in which they are planted may consist of good sandy loam and river-sand. If the plants of Azalea mollis are planted out subsequently to the flowering season each year, the plants that have been two years in the open and have set a considerable number of flower-buds should now be potted up. If the plants be lifted early, it tends to the maturing of the wood and the buds, and they become better prepared for early forcing. A compost of peat and leaf-mould is the best in which to pot them; and for the present keep the plants in the open air. Richardias which were planted out in the spring should also be potted-up. Lift them carefully, and preserve the soil about the roots as much as possible. Some old potting-soil of a rich and light nature will suffice for them, and pots varying from 5 inches to 8 inches in diameter will be necessary for the different-sized plants. When the plants have been potted, place them in a cool pit, which should be kept close for a fortnight; but acterwards expose the plants fully on all favourable occasions, and when growth has commenced, afford them an abundance of water. The most sappy them an abundance of water. The most sappy growths upon Deutzia plants should be removed, and growths upon reduce plants should be removed, and if any of the plants require to be repotted, this may be done at the present time. When lifting Deutzias, it is well to reduce the ball as far as practicable, and make use of pots a very little larger. Use good, rich loam, inclining to clay.

Dwarf growing Store Plants,—The present time is a suitable one for the propagation of most dwarf-growing stove plants, the stock of which requires to be constantly renewed, in order to have nice fresh young plants. Panicum (Oplismenus Burmanni), Pellionias, and Fittomas, may be put into 3-inch pots, placing four or live cuttings in each pot. They will soon take root if placed in the propagating-case, and become useful directly afterwards, when the old stock may be thrown away.

Allowandus, &c. -Specimen plants in flower should be moved into a house of intermediate temperature, and if afforded weak liquid-manure occasionally they will continue to give a supply of flowers for some time to come. The same remarks apply equally to Dipladenias, Bongainvilleus, and Clerodendrons.

General Work.—All shading may now be removed from the plant houses, and air should be admitted upon all suitable occasions. During the next mouth a little extra fire-heat should be given in the day-time, par-

ticnlarly if the weather be snnless. The watering of plants should now be effected before noon each day, so that the excess of moisture may evaporate during the afternoon. The conditions should be made as far as possible conducive to the ripening and hardening of the wood in the plants. Re-grange the plants in the stove, and remove all bulbous and tuberons plants, such as Achimenes, Caladiums, Gloxinias, &c., that have become unsightly. This will provide room for the earliest plants of Poins-titlas, which may be thinly distributed on the side-stages. All hard-wooded greenhouse plants now out-of-doors will need to be removed to the houses shortly. Carefully examine all of them, and if their or red-spider be found, syringe them with strong scapsules from the laundry twice or three times in succession; this should rid them of all insect pests, and give a glossy, healthy appearance to the foliage.

FRUITS UNDER GLASS.

By W. Pore, Gardener, Highelere Castle, Newbury.

Strawberry-plants in Pots.—The runners made by the plants since the latter were potted should be removed as soon as observed, and the soil kept free from weeds. When heavy rains fall, the plants are usually meistened sufficiently at the roots; but when the rainfall is slight, the surface of the soil may be wet, while below it is too dry, and this is a matter that should be carefully looked to. If grown in s nall pots, afford weak manure-water once or twice a week. Do not let them crowd each other, or their development will not be satisfactory. See that no worms get into the pots, and if any have done so, afford lime-water to the soil, which will have the effect of causing them to come to the surface.

Cucumbers.-They may be well gathered up. The top heat in pits, &c., should be kept at 70° by night, and 80° by day; lower temperatures than these may cause mildew to appear. Plants for fruiting soon will require supplies of liquid-manure when moisture is needed at the root. Do not over-crop nor allow fruits to hang too long on the bines, but cut and store them in a cool place. All mule blossoms and ten-drils should now be taken off as fast as they appear, and no more foliage retained than can be fully exposed to smulight. The syringe should now be used only at closing time on bright days, using water for this purpose as well as for root watering at a warmth of 80°. Top-dress with rich, moderately watering light, turfy loam, made warm, as the plants a lyance, and apply as much as will ever the young roots which show through the surface. Young seedlings or rooted cuttings intended for fruiting in the winter may be planted out, and afforded plenty of air on every favourable occasion, and a temperature of 70° by night and 75° by day, with an increase of 10° or 15° from sun-heat. Should thrips or green-fly appear, lightly fumigate the plants. Plants still in bearing on hot beds must have the proper degree of heat maintained by a frequent renewal of the linings; keep the shoots thioly disposed, and regularly stopped at one joint beyond the fruit, and cover the lights at night with mats.

Evrly Vineries.—Vines with which a start will be made in November should now be pruned, and the wounds dressed with styptic or patent knotting. Remove the looser portions of the bark, and wash the rods with a weak mixture of soft-soap and water, using a rather stiff brush in doing so, and working it well into all crevices. The outside border, if any, should be covered with shutters, or something that will throw off rain, a thick covering of dry leaves being placed on the border as soon as these are procurable. Keep the Vines cool by throwing open the ventilators to their full extent.

THE ORCHID HOUSES.

BY W. H. Whire, Butforl, Dorking.

Mosture in the Houses.—Owing to the rainy weather which appears to prevail everywhere, the management of Orchids, where they exist in quantity, should be modified as regards atmospheric moisture, it being a mistake to maintain, in the present state of the atmosphere, a standard of moisture suitable snough in warm dry weather. And more especially should atmospheric moisture be refueed in the intermediate and epol-houses; whilst as regards the warm-houses, a certain degree of moisture should be maintained in order to counteract the drying effects of artificial heat necessary in keeping up a proper temperature, but even here damping down should not be frequently performed. Till there is a need of more artificial

heat, the East Indian, Cattleya, and Mexican divisions may be damped to a moderate extent merging and evening: the intermediate and Odontoglossum-houses will have the requirements of the plants met by one thorough damping done in the morning if it be dull, sprinkling the paths again in the evening only if the dry has been sunny. Beginners in Orchid culture keep on syringing and damping-down each time the air in the houses gets in the least degree dry, but experience teaches us that this practice is a bad one for the plants, especially in the autumn, when most of the plants are finishing up or have completed their growth for the season. To enable new growths to miture, prevent or check the development of spot, to which all species of Orchids are liable, each division should be allowed to get comparatively dry for a few hours during the middle of the day. It is also important that the house or division be well venti-lated, as much air as possible being admitted to every purt, when it can be done without causing any great fluctuation in the temperature of the house or division. In the absence of sunshine, the plants do not dry up so quickly as was the case a month ago, and a good deal of judgment is required in affording water, and the grower will have to be guided by the state of and the grower will have to be guided by the state of each plant, whether in active growth, at rest, or approaching the flowering stage. The present is a critical season for a few of the Cattleyas that are finishing up their growth, viz., for C. Trianai, C. Mendeli, C. labiata, C. Eldora lo, C. Dowiana, C. D. aurea. It may happen that in damp weather the heath which we identify the content of sheath which encircles the new pseudo-bulbs becomes soft, and of a dark colour, which, if it be not quickly slit, may cause decay in the pseudo-bulbs. The plants therefore, should be carefully examined every day. slitting the sheaths from top to bottom when these signs of imminent injury are noticed, and keeping the plants drier at the root for a few days afterwards, and the air drier.

Repotting.-Plants of Cattleya Trianci, C. Mendeli, and C. Mossiae which have grown too large for their pan or pot, are liable to suffer from lack of rooting materials; and as at this season, on the completion of growth, the leading pseudo-bulbs make many new roots, more rooting-space may be safely afforded them. Seme Orchid cultivators object to a re-potting at this season, for fear of injuring the plants; these fears are needless if the right time be chosen, and due eare taken in doing it. As soon as growth in the new pseudo bulb is finished, and young roots become visible at the base, the pot or pan should be broken, and as much of it taken away as may be without disturbing the drainage or roots, and the whole be placed in a suitable sized pot, filling in around the plant and nearly up to the rim of the pot with crocks, and sur-facing with the ordinary Orchid-compost. After such repotting, afford water very spuringly, merely letting it run over the edge of the compost,

THE HARDY FRUIT GARDEN.

By G. Womarie, Gurdener, Rolleston Hall, Burton-on-Trent.

Fruit-gathering.-The fruit of late varieties of Apples and Pears should be examined from time time, taking only those which part readily om the shoots. The heavy rains have been of much from the shoots. benefit to orchard trees, and garden trees not artificially watered, swelling up the fruits of late varieties. Do not gather any fruit before it is fully ready, or it will shrivel, and be of little use. Fruit which has to be kept in good condition till the spring requires much care in gathering and the handling afterwards. When putting fruit into the fruit room, keep the sound and best to themselves; and those which are deformed, or which show signs of insect attack, in some other place apart from them, so as to avert any chances of infection by spores of moulds-they will do well enough for present culinary purposes. Fruits that are bully bruised, also very small fruit, unless they are intended for cider making, should be given to the pigs or got rid of forthwith. No rotting fruit should be allowed to remain in the fruit-room.

Plans, dv.—Fruits of late varieties may be gathered as they copaire a desirable stage of maturity, and laid thinly on the fruit-room shelves for a week of ten days; and if required to be kept for some time longer, they should be wrapped in soft tissue paper and put into shallow drawers or boxes in a cool place till wanted. It is good practice to gather late Peaches and Necturines as soon as they will part readily from the stulk, many being thus sived from wisps and flies. Gather them when quite dry, and place on some soft kind of miterial in the fruit-room to ripen. They will remain good for a week or ten days.

Where the walls have fixed copings, red spider is apt to establish itself on the foliage at the tops of Peach and Nectarine trees at this season, but it may be dislodged by using a suitable insecticide syringed on to it with the wall-tree engine or hand-pump, the foliage being afterwards kept clean by forcibly syringing it with clean soft water every day as early in the afternoon as possible.

THE FLOWER GARDEN.

By Haddev Wyrken, Gudener, Aston Clinton, Tring.

Roses are flowering profusely, the Teas especially, and unless damaged by frost, there is the promise of a quantity of Roses for some time to come. demand for Roses increases annually, if one may under from the output of some of the large Rose nurseries; and as the season for making Rose-beds or filling up of gaps in old ones approaches, the present affords a favourable time for making notes of varieties which are found to succeed in a particular garden, district, or soil, Roses varying much in this respect. Where but little care can be bestowed upon the plants, Gloire de Dijon is one of the best to plant, as it will afford plenty of flowers with a minimum of good culture. In preparing a Rose-bed or border, the soil should be well manured and trenched, and if it is very heavy soil, road-scrapings should be largely added to the staple in process of trenching; but shallow or poor soils should be dressed with marl that has been exposed to the air, or even clay may be beneficial. Old beds may have any of those ingredients added to the soil, so as to impart new vigour to the plants. Eurnt garden refuse and wood-ashes are seldom misplaced in a Rose-bed, as they are substances which help to keep the soil sweet. If a number of plants of a certain variety is required, the order should be given to a nurseryman at an early date, so as to ensure their early despatch if planting is to be carried out during November, which is generally considered to be the best planting month.

Herbaccous Borders. - Now borders may be similarly treated to those for Roses, and the work begun at an early date, which in the majority of cases is preferable to spring planting, except in the case of weak but valuable plants, or such as do not withstand severe winters very well; and these should be wintered in cold frames, or a sheltered place out-doors, to be planted out early in the spring when the plants are starting into growth. The arrangement of a herbaccous border depends greatly upon its position and width. The latter may not be less than 10 feet, if a fine effect is desired. It may have a background of flowering shrubs, and it these be placed at intervals they add to the effectiveness of the whole. As back-row plants, Hollyhocks, Sunflowers, Delphiniums, Tritomas, Paconies, tall flowering Asters, Galtonia candicans, Echinops in variety, Lathyrusl atifolius and rotundifolius, Lilies of various species, Papaver orientale, &c., do very well. As second-row plants, use may be made of Harpalium rigidum, shrubby Phloxes, Anemone japonica and its several varieties, Solidagos, Coreopsis lanceolata, Aconitum autumuale, Statice latifolia, Pyrethrums in variety, Irises of a great number of species, and Eryngium amethysticum. As third row plants the following are excellent, Gaillardias, Antirrhinums, Pentstenons in variety, Potentillas, Aquilegias, Matricaria, Rudheckia Newmani, Scabiosa caucasica, Carnations, Brodies congests, Chelone Achilleas, Carnations, Brodica congesta, Chelone barbata, Erigeron Geum, Helleborus niger and other dwarf forms, Heuchera sauguinea, Montbretias, &c. The front of the border may be filled with dwarfer-growing plants, as Sweet Williams, Pinks, Carnations, Picotees, Polyanthus, Violas, Aubrietias, Alyssums, (Enotheras, Convallaria, Iris eristata, Ramunculus, Erica curnea, Helianthemums in variety, Aster sibirica, and many others. Although it is not desirable to plant in straight lines, the foregoing list will afford an idea as to the arrangement of the vacious plants named.

ticneral Work. Sweeping and rolling will be very necessary after the run that has fallen, and the elgings of the turf require cutting to preserve a tidy appearance. Mowing will still require to be followed up, but where the lawn has suffered much from lack of rain, mowing should not be carried on very late in the season, it being preferable to roll the turf on every twomrable occasion. Walks should be freed from weeds, which abound at the present tune, and if this work be well done at this season, the walks will keep clean till the spring, at which season it is advisable to destroy the weeds with "weed-killer."

EDITORIAL NOTICES.

ADVERTISEMENTS should be sent to the PUBLISHER. Letters for Publication, as well as specimens and plants for naming, should be addressed to the EDITOR, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE SIDE ONLY OF THE PAPER. sent as early in the week as possible, and duly signed the writer. If desired, the signature will not be printed, but kept as a guarantee of good faith. The Editor does not undertake to pay for any contributions, or to return unused com-munications or illustrations, unless by special arrangement.

CORRECTED AVERAGE TEMPERATURE FOR THE EN-SUING WEEK, DEDUCED FROM OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK .- 55°.

THE advantages accruing to The Cultivation settlers in California who carry of Fruit in on the industry of fruit culture California. in an intelligent manner and according to modern methods, have frequently been expatiated upon in these and the columns of numerous journals in this country; and on the strength of the statements thus given currency to, doubtless many emigrants have invested much money in the business. It is conceivable, too, that many of these persons have met with but a very mediocre amount of success, owing partly to the usual great abundance of the crops of various kinds of fruit, the lack of consumers, and of means of rapid communication. As showing the present unfavourable aspect of the fruit-growing industry in that country, we publish the following letter from Mr. WM. KETTLEWELL, gr. to Mrs. A. J. POPE. St. Helena, Napa, formerly of Steventon Manor, Hampshire, together with a cutting from The Examiner of San Francisco of August 16:-

"During the past eight years I have resided here I have often seen bright reports of the fruit growing business, and the fortunes to be made at it, published in the columns of the tiard ners' Chronicle and other English newspapers. I herewith send you a newspaper report, which exhibits the true condition of the fruit-growing business as it now stands. The same thing occurs every year. This season being the worst fruit season ou record in California, I think intending emigrants should not waste valuable time, and very often their hard-carned savings, in fruit-culture here. California produces fruit in enormous quantities, but the great difficulty is to turn it into money at any price. During the time of my residence here, fruit has not averaged 1 cent (!d.) per pound. I remember my father turning the pigs into our orchard when Apples were fetching only 1s. per stone in Yorkshire some years ago,"

The statement in The Examiner, which we have not abbreviated, is as follows:--

"Nearly every inch of available space on Jackson Street wharf was occupied yesterday by erates of fruit and vegetables, which anybody could have had for the asking. McDonogh and Runyon, to whom most of the fruit was consigned, found that the market was glutted, and offered it to the orphan asylum and other public institutions. The result was that commerce in the vicinity of the wharf was blocked for several hours by the teams that came to eart the fruit away. There were five hundred boxes of Pears, five hundred boxes of Peaches, and about two hundred and fifty boxes of Tomatos to be dis-

"The attention of Health Inspector Jordan was called to the condition of the fruit, and he telephoned to the Board of Health. Inspectors Brown and Davis went done to the wharf, and they came to the conclusion that the fruit was not fit to eat. No objection was made to this judgment. The fruit, it was said, was intended for preserves or jellies. For this use it was agreed that the fruit was all right, but the wharf was still in a crowded condition when the teams had packed away all they could carry, and hundreds of tons were thrown overboard.

"The California Transportation Company has been carrying the fruit from the Sacramento River, but the shipments have been so heavy that the steamship people have been obliged to give way to the Southern Pacific Company. The present outlook is that there will be another glut in the market next week.

"The steamer Alvira of the California Transportation C. mpany was due yesterday morning with a cargo of Pears, but up to last evening she had not put in an appearance. She had too large a cargo on board, and got stuck in the mud in the Sacramento River. Most of the fruit on board will probably be consigned to the bay."

This statement seems to show that some, at least, of the Californian fruit-growers are as negligent in the matter of fruit preservation by drying, bottling, and canning as those of this country.

The use of American Vines American Vines. whereon to graft the finer Enropean varieties, has, as is known to most of our readers, proved the salvation of the vineyards in many parts of France. It is not that the American Vines are exempt from Phylloxora, but when attacked they do not fall so ready a prey to it as do the European kinds.

But the number of American Vines is large. and their individual peculiarities correspondingly diverse; some thrive on some descriptions of soil, others on land of a different description.

All this has to be found out by experience, and put on record by competent observers. On clay soils, where there is little or no lime, all the American kinds can be grown more or less successfully, but where the soil is of a calcareous nature, it is only certain of the varieties that succeed. Thus, Vitis Berlandieri is the best stock on limestone. On other soils it does even better, but on these it is surpassed by Vitis rupestris, which will not grow at all on the limestone. Such is the nature of the facts collected in a little work by MM. VIALA and L. RAVAZ, and which may be commended to the notice of those of our colonial friends who cultivate vineyards, and which is not without interest to our homo growers.

A description is given of the more important species and varieties, accompanied by illustrations. The powers of adaptation to particular soil, and the degree of resistance offered to the Phylloxera is also noted, according to observations made in the Agricultural School at Montpellier. A number of hybrids are also described. and of some of them the interesting observation is made (p. 227), that the powers of adaptation are greater than in the case of the parent species. They are more vigorous, as hybrids are apt to be, and they have at least equal powers of resistance. Hybrids between our European Vines (all forms of V. vinifera) and various American species have also been raised in great numbers. The hybrids, speaking generally, have a better power of adaptation than the pure American species, but their powers of resistance to the Phylloxera are not to be depended upon.

Taking the number 20 as representing absolute immunity, the authors of the book before us give the following comparative table: -

20.--Absolute immunity.

19.-V. rotundifolia.

18.-V. rijaria, V. rupestris-V. cordifolia, riparia -rupestris, cordifolia - riparia, cordifolia - rupes-

17.-V. Berlandieri, V. monticola (?), riparia-Berlandieri, riparia - monticola, rnpestris -

16.—Rupestris du Lot, rupestris de Lézignan, cinerea-rnpestris, riparia-æstivalis.

15.-V. einerea, V. astivalis, V. candicans.

11.--Vialla, Solonis, Novo-Mexicana, Noah

13 .- Taylor, Michigan

12.-Jacquez, Herbemont

11. - York, Madeira

10.—Elvira

9, below 10.-Othello, Autuchon, Concord, V. Labrusca, Senasqua, Black Defiance, Croton, Duchess,

The groups numbered 16 to 20 have sufficient resistance in all soils; groups 14 and 15 include Vines with resistance only sufficient in sandy and damp soils where the Phylloxera does but little harm; the Vines classed under 13 and under should be absolutely eliminated from vineyards.

A table in the Appendix shows the number of hectares in France treated with various insecticides, as compared to the number of hectares on which American Vines are cultivated. The figures are very interesting, but we can only find room for the entries relating to the years 1880 and 1894, and we give round numbers only. In 1880, 6000 hectares (a hectare = $2\frac{1}{2}$ acres) were devoted to the growth of Vines grafted on American stocks; 5000 hectares were treated with bisulphide of carbon, 1000 with sulpho-carbonate of potassium, 8000 hectares were treated by submersion, a process which can, of course, be carried out in certain localities only.

In 1894 the number of hectares variously treated was-American grafts, 663,214; bisulphide of carbon, 50,452; sulpho-carbonate of potassium, 8,744; submersion, 35,325.

Chapters on cultivation and on the methods of grafting are given, and the work ends with a bibliography, a classified table of contents, and an index. We need not say how much these add to the value of the book, whose full title we append in a footuote.*

CALCEOLARIAS AT THE GRANGE, BOOKHAM.

-The residence of ARTUUR BIRD, Esq., is about a mile and a balf from Great Bookham railway-station, and from Mr. Douglas' Edenside Nursery. The whole area represents 80 acres, and a large part of this is occupied by the garden and pleasure-grounds. usual features of a garden are all represented. There are fruit and plant-houses, in some of which we noticed during the summer very fine crops of Cneumbers and Tomatos. The vegetable gardon is rather small, being little more than one acre in extent. The pleasure grounds are distinctly pretty, and there are

^{*} Les Vojnes Andricaines, Adaptation, Culture, Greftage pépinières, par P. Viata et L. Ravaz (Paris: Firmin-Didor).

some old chalk-pits now clothed with under-shrubs and Ferns, which afford an excellent opportunity for creating a very picturesque feature. They are very pretty even now, for some work has already been done in them. Mr. A. W. SMITH, the gardener, has had charge only for a comparatively short time, and one of the first floral effects he produced was by a group of well-grown plants of herbaceous Calceolarias in the spring of the present year (see fig. 66). In cases where a gardener may move to a place possessing few plants in the houses suitable for furnishing a quantity of bloom, it is worth while to remember

attention of the committee was first drawn by the Superintendent, Mr. S. T. Wright, to a large collection of Potatos, chiefly late varieties. These had all been well cultivated, and for the season had done very well. On lifting a few roots of each, however, some were found to be too small or indifferent croppers, some had supertuberated considerably, especially the long kidney varieties. A few gross growers were all root-fibre, and had few or no tubers; and some others gave very fair results, though in no case equal to what other varieties have yielded in previous better seasons. The committee selected pine varieties for

have not been previously found quite true to character. The committee then visited the quarter devoted to an extensive trial of Beets. Whether due to the season, which led to irregular germination, or to bad stocks, very few of these were really true to character. Many, fully one-half, were of very course growth, more like Mangold Wurzels, the roots being also coarse. A few roots of each row were pulled, and sliced longitudinally, so as to show the colour and texture of the flesh. Many were too light in colour or had coarse flesh. One or two had a dark colour that was very objectionable. Some, however, had tops and roots

Fig. 65.-A 610 P 01 CAICEOLARIAS AT THE 61 C 6E, BOOKHAM, SURLEY, IN 1500 THE C 505

that there are plants of such a character, which may be raised from seeds, and in a few months be available for the purpose. The herbaceous Calceolarias are just such plants, and though they are less cultivated than formerly, we think many gardeners have very insufficient reasons for banishing them from their houses.

ROYAL HORTICULTURAL SOCIETY.— A fifth meeting of the members of the Fruit and Vegetable Committee was held at Chiswick, on Thorsday, September 17.—Present: Mr. P. Crowley, chairman: and Messrs. J. Smith, A. F. Barron, G. Wythes. W. Bates, J. Wright, G. W. Cummins, W. Farr, R. Fife, G. H. Miles, and A. Dean, thus making a full γ-torum. The

cooking, and samples having been so prepared, were submitted to the members at the close of their labours, when the following received awards.—Sutton's Triumph, a fine well known white round, and Syon House Prolific, had their previous awards confirmed. Saxon, white round (Kent & Brydon), and Early White Kidney (R. Dean), each had three marks given. Some trials of Cabbiges, spring grown, were next inspected, but whilst there were amongst each, especially those of Early York, many good, true heads, far too many were not true. In one instance a large, thickly-veined Drumhead, the stock was excellent, but the variety is totally unfitted for garden culture. It is a pity that large Cabbages should be sent to Chiswick for trial that

that gave great satisfaction. The following were selected for three marks each. Nutting's Dwarf Red, from J. Veitch & Sons, Nutting & Sons, and Heinemann. Cheltenham Green Top, from J. Veitch & Sons, Watkins & Simpson. Nutting & Sons, and Yates; Dell's Crimson, also from J. Veitch & Sons, and Dobbie & Co.; Perfection Dwarf Red, from Hurst & Co.; and Egyptian Turmp-rooted, from Vilmorin & Co., and Watkins & Simpson. Some varieties and stocks of known good reputations had either suffered from the season, or else were represented by inferior strains. As Beets do not increase rapidly in variety, and we can hardly expect to greatly excel the best of what we now have, it seems very advisable that the trial be repeated next year, but to the exclusion of every

carse, worthless variety that is unfit for garden calture. Chiswick merits better treatment than to be made the dumping-ground of any kind of rubbish; we have a right to expect that only the very best will be sent there for trial.

THE ORCHID HOUSES AT KEW, like similar structures in mist gardens are less gay ist now than they have been during the greater part of the year, but a week ago we hinted there a very fine spike of flowers up in a plant of Vanda contient. It contained seventeen expanded blissings of large size and good colour, and they exhibited that delicate mottled appearance that is is servable in some flowers of this species. It is grown in an intermediate house, with a temperature such as is afforded Carileyas. Where so much yequies have to be grown under one roof, as at Kew, successful culture becomes the more difficult.

A MUSCAT GRAPE SPORT AT CHISNICK tirrespendent remarks on what is an unblubted Mu-cat Grane sport, which might have been seen recently in the great vinery at Chiswick. Just within the west entrance, and in the right hand is le, is a strong Muscat of Alexandria vine. This season one of the laterals, about 8 feet from the floor, threw a bunch the berries of which exhibited alm at precocious size from the first; and when shown the other day to the Fruit Committee, not uly were the berries fully me-third larger than were those on any of the other lunches, but the skin was firmer, as also was the desh, and the flavour was of the nnest. It was generally agreed that the bunch and berry were exact counterparts of the Cannon Hall Muscat, and Mr. J. T. WRIGHT will propagate the sport from the lateral by means of eyes next year. It would be doubly interesting if eyes from the true Cannon Hall Muscat were struck at the same time, so that y ung Vines from the two enuly be planted and fruited simultaneously. Also eyes from other laterals of the riginal Museat variety should be grown on. The of it leads naturally to the inference that Cannon Hall Muscat may have originated in the same way. It is believed, ordging by the excellent set on the sport bunch, that the flowers, if the sport be perpetuated, will set freely; and if that should be so, it might greatly enhance the value of the Juriely.

THE DEVON AND EXETER GARDENERS ASSO-CIATION. - The annual has ness meeting of the Assilation will be held in the Council Chamber of the Gradhall, on Wednesday evening next, Sept. 30, at eight felock prompt. The President of the association will take the chair. Business: to reclive the secretary's and treasurer's report for the past year; to elect a president vice presidents, secretary, treasurer, and committee for 1500 97; and to transact any ther competent business that may be brought forward. The following programme for the session 1596-97 has been adopted. — Wednesday, O.t. 7. Mr. W. Charley, gardener at Wonford House, will read a paper on Stills; on Weinesday, Oct. 21, Mr J. W. Morman, superintendent, Victoria Park, London on the garlens at P timere Park will real one in Villas for Beiling Parposes, On Weineslay, N. v. a. there will be no meeting. twing to the Bevok at I Exeter Horticultural Society holding their Chrysattachina and Fruit Slow in November Jaul 6. Welbeslay, Nov. 1s. Mr. G. Foster, galleter t. H. Hommin's Spener, Esq., Glendurach. Teigramith, all read a paper on Chrysinthemiums and their Cuture; on Welmeslay, Den 2 Mr. F. W. Meyer, R yal Nationies, Exeter. van descurse on Fig. a Gurbens at Home and annul illustratel by amed glat - 111 au Welneslay, er 15. Mrs. Malaheter, Hame ale, Bampton (an andry member of the Association, who leature in els fil Decorative Luiposes.

NEW ROSES - It is more than it weeks, it that the first large of who ag Carpsonthem has of the season few of the jet we have how to alknowledge a magnituation of the first lass blooms, as fresh, as pretty, and as seet and it is immer was still with us rather

than the closing days of September. Madame Abel Chatenay is a hybrid Tea variety. The flowers are of moderate size, full, and very sweet. In the bud the colour is rich rosy pink, bordering upon cerise, the petals close, and the bud shapely, and as the flowers become developed, a lighter tint is assumed; it appears to be very free flowering in habit. Queen Mab belongs to the pleasing group of China It ses, and is one of the newest varieties in that freeblooming section. The buds are very pretty, and resemble these of W. A. Richardson in their adaptability for use in battanhole and other small bouquets. The flowers are in re-full than the usual type of China Rose, they are produced in very great pro-tision, and the colour is more or less salmon-pink, the base of each petal being pale canary yellow. The growths appear robust, and are exceedingly well armel with formidable spines. Both varieties are sent us by Messes. W. Part & Sons, Waltham Cr as Vorseries Herrs

THE ROYAL GARDENERS' ORPHAN FUND.—We are glid to learn that a concert in ail of this find his been arranged to take place under the auspices of the Shirley and District Gardeners' and Amateurs' Mitual Improvement Association on Wednesday, the both in-t. The secretary is Mr. H. J. Hobby, 41, Palwell Road, Southampton.

BERLIN IMPERIAL GARDEN.—The Short of Feleper chart of September 21 says that Mr. Owen Thomas, of the Royal Gurdens at Frogmore, was recently asked to select one of his young men to proceed to Berlin, in order to develop the vineries in the garlens attached to the Imperial Palace. The relection has now been made, and the viticulturist will shortly leave Windsor for his new appointment.

MR. W. G. HEAD.—We regret to learn that the popular superintendent of the gardens at the Crystal Palace was the subject of a critical operation for an internal complaint on the first inst. It is however, satisfactory that the operation has been successfully performed, and that there is every hipsoif a specify recovery.

SHIRLEY GARDENERS AND AMATEURS MUTUAL IMPROVEMENT ASSOCIATION.—At a monthly fixeding held on the filst inst, in the Parish Room, Shirley, Southampton, Mr. T. Lowss, honorary secretary of the Winchester Garleners' Mutual Improvement Association, gave a lecture on "The Cultivation of Roots Crops in Gardens." The licturer referred chiefly to Potatos, Carrots, Onions, and Beet; and there was a very interesting discussion on the relative value of Potato sets. There was also an exhibition of vegetables, &c., and C. G. Stuart Menterh, Esq. J.P. gr., Mr. W. Risbridger, was awarded a certificate for a collection of six kinds.

ESPARTO GRASS IN TUNIS .- It is officially reported from Tinis that the quantity of Esparto Grass Stips tenscissima) continues to decrease, the value shipped from the various ports in the south amounting only to \$43,652, which showed a decrease of £14.77% as compared with the previous year. This is any out i for by the employed increase of wind-pulp for paper making. Paper of the lest class is, however, still extensively made from Esparto, and there is consequently a considerable demand for this article. Unfirt mately for Tunis, Algiers and Tripoli likewise proline an abundance, and offer a serious rivilry to the Toursan product in Independently of this, the linear merchant siders from a more severe englis france in his transactions. There exists a Viol is system if taxition, which taken with the great falling if in the value it his morehaulise, to have it with the possibility if from in the sale of the exporter. A reliation of this tuestion is much to be desired, as it would not only intriove the prospects of an impor-tant branch of trule, but would, at the same time, by so doing, give employment and support to a large quarter of natives, who in years of ball harvest are dependent on the Esparto gathering as a means of livel.hood.

ARTIFICIAL COFFEE-BEANS. - Artificial whole Coffee has long been known as a commercial commodity, but we were scarcely prepared for the statement recently made by the West Indian and Comsecretal Advertiser, that it is now manufactured to an alarming extent, consisting of the roasted meal of different cereals worked up with dextrin. Two different factories, it is state i, have been established at Cologne, which undertake to furnish the requisite machinery and plant, with directious for making the false Coffee-beans. The apparatus supplied by these wholesale swimllers is capable of turning out more than half-a-ton daily, at a cost of about £1 per ewt., good Coffee having a arly five times this value in the market. The fictitious Coffee is difficult of detection by ordinary examination, especially when a proportion of genuine Coffee is mixed with it.

WHEAT ACREAGE OF GREAT BRITAIN .- From the last issued number of the Journal of the Board of Agricelture we take the following few, but suggestive, figures contained in a brief tabular statement, entitled "Preliminary statement for 1896, compiled from the returns collected on the 4th of June, and comparisons with previous years." From this we learn that the acreage in Wheat in 1896 was 1,693,957; in 1895, 1,417,483; in 1894, 1,927,962; in 1893 the acreage was 1,897,524. Passing on to the details we find that the increase of 1896 over 1505 was spread over England, Wales, and Scotland the counties in which less. Wheat was sown this year than list were London and Cumberland - those which have the smallest acreage. In the county of Loulon only 151 acres of Wheat were sown and readed. The reader will readily notice the disparity between the present year's acreage and that recorded for 1894 and 1893; but just a line to note that there are now 231,005 acres less in Wheat than two years

THE BUSHEL-BASKET CASE, -Gardeners will feel interested to know that the decision of the Brentford Justices, that all bushel baskets used for me suring must be stimped, is not to go unchallenged. Ou Saturday Mr. Bett. on behalf of Mr. A. Reffell, applied to the Justices to state a case for the consideration of the Court of Queen's Bench. The Chairman stated that he and his brother magistrates had fully received the notices served upon them, and had carefully per used them. The case was of very far reaching importance, and was one that should be known throughout the country. This being so, they were willing to aid in a final decision being come to; but otherwise they did not consider the points raised in the notice would have been sufficient for them to state a case upon. They had promised to aid in a full and final decision being obtained; and, therefore, they would raise no objections to stating a case when the legal formalities had been complied

CRYPTOGAMIC SOCIETY OF SCOTLAND .- The members of this society held their twenty-second annual conference on Monday, September 13, and three following days, in the beautiful village of Fochabers, same nine miles from Elgin, N.B., and within a few minutes walk of Gorlon Castle. members present, all of whom stayed at the Gordon Arms Hotel during the week, were : - Rev. Dr. Stevenson, Glam's, President and Hon. Secretary; Professor James J. F. King, Glasgow [since dead]; Professor J. W. H. Tra'l, Aberdeen University; Rev. Dr. Kelth, Forces , Dr. Watson, Slateford, Midlothian; Rev. D. Pail, Rexburgh: Mr., Mrs. and Miss Crawford, Stateford, Mullothian; Mr. Angus Grant, I rummidrochit, Inverness : Dr. Gage. Aberdeen : Mr. Rennison, Paisley: Mr. McKeuzie, Clasgow, &c. On Monday, Tuesday, Wednesday, and Thursday, the party visited the Castle grounds, deer park, Speysile and the various woods in the district. Each duy they secured many interesting specimens of fungi, these being the particular cryptogams they were in quest of this year. A number of the specimens found were exceedingly rare, but none of them is new to science. The members were delighted with their visit to the Fochabers district, and with the hospit dity extended to them at the Gordon Arms.

GARDENERS' SPORTS .- A friendly and interesting series of Athletic sports, confined to gardeners and gardeners' labourers, was held on Saturday, the 19th inst., in a field at Ferguslie Park, Paisley, kindly granted by Sir THOMAS GLEN-COATS, Bart. The events consisted of racing, jumping, hammer-throwing, vaulting, tug of war, &c. Each event was well contested, and great interest was shown in the proceedings. The judges were Messrs. DONALD MCBEAN and ROBERT McHARDY. At the conclusion of the sports, the prizes were distributed by Mrs. WILLIAM Cameron.

THE ASSESSMENT OF GLASS-HOUSES. — Λ question of importance to nurserymen and fruit and flower-growers is likely to engage the attention of the Courts of Law ere long, dealing with the assessment of glass. Hithert, the view Las been held that glass should be considered a utensil intrade, and therefore free from being assested either for poor or district rating purposes. The Worthing Case has been regarded as having dealt with the point, and finally drawn the line between rateable and unrateable glass. But, in spite of this, the nurserymen and market cardeners in the Brentford Union Middlesex), an area which comprises such agricultural and fruit growing districts as Isleworth, Twickenham, Heston, Greenford, Ealing, and Brentford, have had the glass in their possession or use dealt with in a manner that has caused them perhaps little short of consternation. The work was not undertaken by the overscers of the parishes who have hitherto eschewed rating glass, but the Assessment Committee of the Union took it up themselves, and employed Mr. C. F. Jones, a rating surveyor, to get out the lists. Upon what grounds or bases he has made his valuations is unknown, and not the smallest amount of information has been given by the Assessment Committee to the gardeners or the legal gentlemen who represented them on the appeals they made to the committee, As instances of re-assessment, on one garden at Acton there has been a jump from £5 to £44 in the net rateable value, more than five times as much; whilst at Hanwell, at a big nursery, the rise has been nearly four times as great, viz., from £40 to £140. In another case also at Hanwell, the rise was from +500 to £100, or just double; and yet in another case, as I see, the rise was but £4, viz., ±56 to £60. In the instance of large glass-houses at Chiswick, the ratio on increase was less than double; at Brentfird the rule seemed to be two-thirds, i.e., from £24 to 278. On one garden at Twick-nham, the increase was from £24 to ±100; but in another case in the same parish there was the remarkable rise from £2 to £75, or thirty-eight times as much! These are but a few cases out of many, and the general principle that has been followed, it has been stated, is to rate the land on which the glass stands as if it were building land. Before the committee the cases have been argued at great length, and a variety of views have been urged, but with no effect in the majority of in-tances. In a few appeals, however, the assessment committee have feared the strength of their own figures, and have made reductions; but their obvious intention throughout has been to have the questions tested on appeal to Quarter Sessions. A number of the gardeners in the district have combined, and intend carrying the cases to Quarter bessions, having been fully advised the actions of the assessment committee are unjust as well as illeral

THE IRISH GARDENERS' ASSOCIATION have determined to celebrate the tercentenary of the introduction of the l'otato into Ireland by holding a Conference and Exhibition of Potatos in Dublin towards the close of the year. The Pitato was first planted in Ireland in 1596 by Sir Walter Raleign, in the garden attached to his residence, Myrtle Villa, Youghal. The house is preserved, and its antique furniture maintained precisely as it was in RALEIGH's time and the exact spot in the ground is shown to visitors where the Potato was for the first time planted in Irish, and indeed in European, soil. Irish Norw.

THE QUEEN is going to expend a considerable sum on improvements at Osborne. Large kitchen gardens are to be formel, and extensive hot-houses are to be built. At present all the fruit and vegetables which are consumed at the Palace are supplied from Frogmore, Truth.

ASSIMILATORY INHIBITION IN PLANTS .- The Journal of the Linneau Society, published on July 5, contains a paper by Mr. Alfred James Ewart, "On Assimilatory Inhibition in Plants," that is to say, the causes which check the formation of nutritive matters in plants. The author's condusions are as follows:-"By the operation of a variety of agencies a condation of assimilatory acrest r inhibition may be induced in living chlorophylloreous cells and tissies. These are-dry heat, most heat, cold, desiccation, partial asphyxiation, etherisation, treatment with acids, alkalies, and antipyrin, accumulation of the carbo-Lydrate products of assimilation, immersal in very strong plasmolyti - intions, and prolonged insolation. The inability - assimilate is, if the cell remain hving, only temp corp. being followed sconer r later by a more or less complete recovery of the power of assimilation. Forcing the whole time in which the power of assimilation is absent, the cell continues to require. By the direct effect of each particular agency, the respira-tory activity may, in some cases, be but little affected etherisation, the accumulation of carbohydrates, in one case is inir used (moist heat, but in most is diminished and it le-location, immersion in strong plasmolytic solutions. The question, whether or not an after effect may as the produced on resplration, is unable sensibly to affect the results obtained as regards assimilation. If the inhibition of assimilation experimentally prolined be permanent, the cell finally dies, and reason to respire. In the great m jority of cases no visible change in the chlorophyll or the chlorophyll grain is assistated with the stoppage of assimilation. In such cases the assimilatory arrest probably originates in the plasmatic stroma of the chlorophyll corpus lessel may be due to some breakage in the necessary total connection between the assimilatory pigment will the assimilatory plasma. Must of the above inh. try agencies operate by checking or arresting the mand stages or primary processes of assimilation. It imposition of CO, and rmation of carb hydrate it it since the accumulation of carboby irate affects assimilation, any cause interfering with the rapidity of its removal from the assimilatory consumay als tankly effect their power of assimilation. Hence in the plant, as a while, assimilation may be influenced by causes operating upon the general cell process if assimilation abscritting elaboration, and transformation of the assimilated carbo-hydrates, either if the assimilatory cell itself or of the cells which are dependent upon it for their supply of carbohydrate food-material, or by a closure of the channels through which these carbohydrates are removed. Cells in which the green colour of the chlorophyll grains is quite masked by the presence of a brown or reddish-brown g guent may show a dis-tinct power of assimilation. If the reduction of the chlor phyll be complete, as miliation ceases. In certain cases isolated chill, phyll bodies may continue to assimilate for a shirt time after removal from the cell to which they whomg. A developing leaf in which the childrophyll untins are being levelopel table of the page to lasmic differentiation. Lasks at first the page of seindlation. The conmencement of assimilar in is betermined mainly by the devel prient of the .hl . phyll pigment, but is also largely induenced by the auditerminate facture. probably plasmatic in crime.

THE DOUGLAS FIR.

THE remarks upon the Dourlas Fir. on y Guide oire Chimnele for Sept. 12, are in several points interesting to far as the finiter of the Douglas fir gr.wa .n this country has yet been tested, it has not shown the permiss tendency of the imported spars mentioned by "H. R." to shell- if the annual rings in wood in splinters in the manner be describes, and which would prove a great drawcalk to its general usefulness Shill it has been found that home-grown wood if Douglas Fir possesses a millinwer breaking strength than that imported from Ones in and British Columbia. This britieness if the will may recome less and less, however, as the tree attains to fell maturity to properly-treated plantations in Emban . and perhaps it may ultimately stand as great a breaking strain as the imported article. The titler of a faily-matured tree a century or more allocate grown in a dose can by wood, is required to give a reliable and useful test of the judities of the Douglas Fir timber grown in this elentry. Till that time arrives, well on in the twentieth century, its merits can only be gressed at as a matter of speculation.

Many thousands of the Dunglas Fir have been lanted on the Perthshire estates if the Earl of Mansfield within the past firty years, and they are turiving vigorously in all manner of places where a tree of its nature has the least chance of sucress. All these have been raised from seed produced by one tree growing at Lynnelisch, a few miles north-west f Perth. in the Some estates. This fertile tree, which is if the 'gleen' variety, and another the tree if the "blue" variety, which fruits but spursely were planted in the year line, by L of Lydelinia who then exact the property, and which introducts posed into the hands of the Earl of Murshill. They are splendid examples of the Dunglas Fir, and as seen this virtuals, they are still throtily and growing with great vig.ur - the seed bearing tree being still pro-toried by the fence described by "H.R." is defend the comes from squirrels and ther marsufers, for

which purpose it has proved very effective.

Two plantations of Dingles Fin were formed in the Some estates by Mr. William McCompublishe in 1967. one at Munrward, near Scine, extending to along 13 alres and the other about the same in extent. at Taymount, a few miles to the nitthward, and ying between the public road and the radway of or This per ween the put to real and the raiway at it halfway from Perch and Funkeld. This latter funkeld in is probably the one shown to He IPTLy Mr. Meetron in the analysis earlier trivellers in the Highland Ludway which runs for a size district along its custom conducy. This plantage has been along its custom conducy. This plantage has been along its custom conducy. and both the young und older portions are through vir mody, this are to to be examples of the loc poss of the Pouglas Firms of trest tree in South 1 It is reported, that when Professor Supergodia the Firest Amieny, at Everswelle, Frass . spected this plantation of Disiglas Fire lawns cent what to the Schush Arcorolist and S definite but to be the dest enoughe by a constitution that the constitution that the constitution because with a fair of the second tree. telesises with a last of a law year of some year by year manifolders in some in the grant of the fractioners from the grant of the area and independently obtaining the stems of the first of the present and typical manager of the Some estates. Mr. Alex Pitonithley, the froming is well had by Mr. Modorphickle is fully manufacted in these fames plantations. M. plantations. M.

HOME CORRESPONDENCE.

HYDRANGEA HORTENSIS.—I read the note by your correspondent "H. M.," p. 272, ou the cultivation of Hydrangea horteusis with interest, as it is one of the most desirable plants for the greenhouse in spring and summer. It forces readily nuder good treatment, summer. It forces readily nuder good treatment, heads 15 inches in diameter being obtainable from plants in 5½-inch pots. Unlike "H. M.", I ne rer had difficulty in inducing cuttings rooted in early summer to flower the following spring and summer. I insert cuttings of slightly hardened wood (if too soft, they do not strike readily) in small vets filled with learn leaf than 12 and sand late in pots filled with loam, leaf-mould, and sand, late in May or early iu June; plunge them in a close case in stove temperature, and as soou as they are rooted, remove them to a greenhouse or cool pit, and in a few days pot them in singly into 4-inch and 5-inch pots, and as soon as the roots have taken to the new soil, remove them to a cold frame fully exposed to the sun, and aired freely till late in the summer, when they are put outside. All the summer and autumn they are kept well supplied with water. On the approach of winter they are removed to a cold greenhouse, and kept slightly dry. Early in March they are potted on into 6 and 7 inch pots, and given greenhouse treatment. As soon as the flower heads show, the pots are placed in saucers and kept well supplied with diluted liquid-manure. By the above treatment plants can be got bearing from one to four heads of flowers from 9 to 15 inches in diameter, and the plants from 15 to 20 inches high. Very good results are obtained from plants raised annually from cuttings, but in this district in cottage gardens large specimens 5 feet through may be seen growing in the open, and bearing their beautifully-tinted flowers in abundance every year. R. Turnbull, Beachley.

A CURIOUS PLUM-SPORT. - For two years past I have been invited to visit Alton, Hauts, and examine an odd sport on a Plnm-tree in the garden of Dr. Stewart. This year, time offering, I went to Alton to see that lusus nature. Dr. Stewart's garden abuts on to the high road that runs through the town, and is at its southern end. The variety in question is Mitchelson's Plnm, and is one of a pair of standard trees purchased from Shilling, of Hartley Row, just about thirty years age. The main stem is clear of branches up to 6 feet in height, then there breaks out a stout one, and about 3 feet up this branch a smaller one diverges, and the whole of the growth on this branch has not only smaller leafage than is found on the rest of the head of the tree, but every Plnm produced on it is yellow, having the form of the purple Mitchelson's, but not quite so large. Really, they resemble fruits of Coe's Golden Drop. The flesh, however, is rather dry and mealy, and separates readily from the stone. The shoot in question appeared some eight years since, and the yellow fruits have been produced for five years in snecession. There were fully two quarts ou the branch this year. The tree, as it is close to his residence, has been under Dr. Stewart's notice, ever since it was planted, for he is a keen, indeed almost enthusiastic, pomologist; but never at any time has there been any budding or grafting done of any other variety ou the tree. The sport is such undoubtedly, and possibly it is a case of reversion to one of the Mitchelson parents. Some way up this sport-branch a strong shoot has broken out this season. I have asked that it may be left, as there are evidences of that also being a reversion to the original variety. Dr. Stewart's garden is full of Pear, Apple, and Plum trees, and he has amongst them many fine sorts. soil is somewhat thin, resting on chalk, but whilst checking strong growth, it seems capable of frequently producing heavy crops of fruit. A. Dean.

PELARGONIUMS rersus BEGONIAS.—Our gardening prophets never tire of predicting the inglorious end of the reign of the Pelargonium in our gardeus, especially as a bedding-plant, and preclaiming the advent of its invincible rival, the tuberous Begonia. Is it likely to happen, I wonder 'Fancy the banishment, the total obliteration of the Pelargonium of our youth, and all for the sake of a scentless, heavylooking flower, of nondescript origio, as neeless in an ordinary posy as a Sunflower or a Thistle head! Fashion can do much, but here, I hope she will be only very partially successful, and that we shall keep our dear, expensive zonal tricolors, bicolors, and many scented Pelargoniums. I had almost said that I hoped Peronospora devastans species would come over from the western hemisphere and affect the tubers of the upstart Begonia. It was once shy and ashamed, and hung its head prettily, and was not in the least obtrusive. It was

very nice of the plant to do this, and we petted it, making nice beds for it in comfortable warm corners, where it grew well, and quite came up to one's expectations of it. But now that it has been improved, its manners are impudent not to say aggressive. A corner is not good enough, for it must have the finest place in the flower parterre, forsooth! and only think, the chit cannot be more than thirty years old. It is enough to disgust An O'd Hand.

FACTS RELATING TO APRICOTS. - From numerous investigations it has been found that good ripened Apricots should contain not less than sixteen times a greater weight of flesh than of pits. The relation between fibre and juice in the flesh is usually quite constant, the jnice amounting in all the best varieties to about seven eighths of the flesh. The quantity of sugar in Apricots ranges generally from 4 to 6 per cent.; but it may, in exceptional cases, go up to 15 per cent. It appears that a low amount of acids in the fruit is combined with a high percentage of sugar. The Apricots as a whole (pits included) show from I to 2 per cent. of albuminoids, but in inferior varieties this constituent sometimes goes down to less than 1 per The fruit of the Apricot abstracts from the soil in each 1000 lb., 1 lb. of nitrogen, and 5 lb. of mineral constituents, of which potash is the leading ingredient, amounting to more than one half of the total minerals. Phosphoric acid is not so heavily drawn upon, but amounts to about 10 per cent. of the ash. Soda is somewhat less in quantity than phosphoric acid. Lime and magnesia are about in equal demand, being one-third that of soda; the pits, bowever, require for their perfect formation twice the amount of these ingredients than does the flesh of the fruit. Sulphuric acid also shows largest in the pits, while silica is in greater demand by the flesh, of which probably the outer skin takes the largest share. The amount of nitrogen required for the production of wood and fruit, and more especially for the increase of the non-nitrogenous constituent sugar on the fruit, emphasizes the necessity of au early replacement of this ingredient in the soil. J. J. Willis, Harpenden.

A DRESSING FOR WOOD WORK.—In answer to "J. C. M.," on p. 343 of the Gardoners' Chronicle, I would advise him to put on his garden-frames to protect them, and also greenhouses, &c., Stockholmtar, thinned with petroleum, in about the proportion of I quart of petroleum to I gallon of the tar, the wood to be thoroughly dried before the mixture is put on. Two coats would preserve the wood, and last longer than any other kinds of paint that I have tried. It dries quickly of a brown colour; it will take white or any other coloured paint, and is very cheap. We use it largely at lasing Park; and it is a dressing that will be very much used when its good properties are better known. I ask all who are putting up new garden buildings to give it a good trial, as it will not injure the tenderest plants. I have a new house just dressed with it, which is filled with Ferns and Cinerarias, and these plants are doing splendidly. Wm. Smythe, The Gardens, Basing Park, Altim.

At one time the stage in one of my plant houses was very much out of repair, and my employer suggested that the repairs then to be made should be creosoted. This was done, and all of the plants in the house afterwards became unhealthy, parricularly Adiantum cuneatum and Ficus elastica. The whole collection, in a more or less degree, appeared as if they had been scorehed. Before using the creosote all of the plants were perfectly healthy. I have used gis-tar upon frames three or four months previous to putting plants in them, and with very satisfactory results. G. B.

CRANSTON'S EXCELSIOR ONION.—Cranston's Excelsior Onion is in great request amongst exhibitors of large Onions, these persons knowing that to win in keen competition only a variety of known superiority over others must be grown; that is, it should be of handsome shape, large size, with very small neck, clear in the skin, and of excellent quality throughout. That the above-named Onion has all the qualities that go to make an Onion a favourite with exhibitors, may be judged from the fact, that at an exhibition held at Horeford on the 16th, there were niuety-four entries for this variety alone, and this in response to handsome prizes offered by Mr. J. Wilson. The most of the English, Scotch and Welsh counties were represented, and in which were included the most promiuent Ouion exhibitors in this country. The whole exhibit was a splendid one, and worthy of record, most of the winning bulbs scaling

over 24b. weight each. The winners were:—1st, Mr. H. Pitt, Abergavenny; 2nd, Mr. Noah Kneller, Malshanger, Basingstoke; equal 3rd to Mr. G. H. Copp, Holnest Park, Sherborne; and Mr. H. Folkes, Gaddesden Place, Hemel Hempstead. Three other prizes were also awarded, and these went to Mr. J. McKague, Dalton in Furness; Mr. John Leeson, Barrow-in-Furness; and Mr. A. Bevan, Gloucester. The judges evidently selected only those bulbs for prizes which, beside other excellent qualities, were well ripened, and which, considering the season, was only what might have been expected. A.

MAIZE, OR INDIAN CORN.—The note upon this subject in the Gardeners' Chronicle, at p. 308, leads one to suppose that Maize as a vegetable is practically unknown in England. I admit the cultivation of the plant is not general, but there are several gardens in Devenshire where it has been grown successfully for the table for some years. Mr. P. C. M. Veitch, in his garden at Exminster, near Exeter, has for years grown a crop of it for his table, he, as an old Cape colonist, considering mealies one of the best of vegetable dainties when properly cooked. The seed is sown on a hot-bed about the end of the mouth of March, and when the plants are a few inches high, they are transplanted to fairly rich ground in a sunny situation. They then grow so rapidly, that good cobs of 5 to 6 inches in length may be cut by the last week in July. Provided varieties which ripen early be chosen, there is no difficulty in growing maize in this part of the country, as "A. M. O." remarks; and it is, in addition to extending the list of table vegetables, a wholesome and delicious article of diet. The ordinary Maize or Iudian Corn of the corn-dealers would not answer, but there are two or three earlymaturing kinds that never fail to produce good cobs about the end of July or early in August. Andrew Hope, Exeter. [Kindly say what name these early varieties bear, Ep.1

HARVEST FESTIVALS .- We now are, or shortly shall be, in the thick of these reminders of the rapid passing away of the year. What follows may serve as a useful hiut to the respective committees of the Gardeners' Benevolent Institution and the Gardeners' Orphan Fund. For ten years Sir Walter Gilbey has urged the claims of the Royal Agricultural Benevolent Institution to participate in the distribution of the offertories made in the various places of worship on the occasion of harvest festival services. That the institution is doing a good work is shown by the fact that it maintains 1,163 pensioners of over sixty years of age, all of whom have occupied farms, but who have been reduced to their present condition mainly through agricultural depression. During the last six years, the sum of £39 298 11s. 3d. has been received in collections, last year's total being the largest ever received. If one may say so without, of course, even the faintest intention of criticising this really admirable flow of charity, long may it continue! Yet one may remark that the collections at harvest festivals would seem to be the very source from which such gardening charities, as I have named at the commencement of this note, should derive very material benefit, for it is the gardeners' art, principally, that produces the trophies seen at such. J. B.

SCOTLAND.

PENTSTEMONS.

MR. CHARLES IRVINE, nurseryman, Jedburgh, has been for several years making rapid progress in the improvement of the Pentstemon, and three years ago he was successful in bringing forward a new strain. For these flowers he has been awarded numerous tirst-class certificates in Edinburgh, Glasgow, and elsewhere. Last week a visit to his nurseries at Oakvale revealed a show of Peutstemons that far exceeded expectations, both in extent and quality. This year's seedlings, compared with those of previous years, are not only superior in size of spike and shape of flower, but in general colour and marking; the spikes, which are pyramidal in form, are thickly set with blooms, while the flowers are well developed and of very large size, some individual blooms measuring from 2; to 3 inches in diameter. The Marchioness of Lothian is one of great elegance; the flower, which is large and of excellent form, is of rosy-carmine, with chocolate marks and beautifully striped with purple. The March oness has a keen rival in the Countess of Dalkeith, a beautiful waxy-white, edged with a faint tint of manve; this flower, along with a few others of the same race, has a faint tinge of yellow. The Border Maid, which recently carried off first honours at Edinburgh, is pale pink in colour, with a pure white throat, and beautifully feathered with crimson. Waverley is a charming specimen of perfect form, being of a bright pink with crimson feathering. Perhaps one of the finest was named after Rob Roy, the bold outlaw; it is a light scarlet, faintly tinted with crimson, and throat of white. Mr. Irvine, besides being great in Pentstemons, has gone largely into the cultivation of Roses, Carnations, Delphiniums, &c., and it may be interesting to mention that this year he was successful in producing a pure white Delphinium; it is not only white in colour, but is a most perfect flower, of a large size, and of excellent quality. This, so far as we know, is the first pure white Delphinium ever raised in the United Kingdom. X.Y.

O F S W A L L O W S. By Harrison Weir.

(All right: reserved.)

Few, if any, birds are more beloved than these, not even the almost sacred robin, the children's garden and our household pet. How eagerly we all

Each and all beloved in their degree. As a rule, "the continental traveller" comes home again about the beginning of April. Once I remember he came on old Quarter-day, April 5; but he is generally later, varying in time from April 11, 1814, March 30, 1846, and out of the sixteen years noted, the latest arrival was April 25, in 1852. Naturally the bird, when possible, adapts his time of coming to that of being able to get food. If the weather is not genial, or it rains or snows incessantly, then but one fate awaits him-death. Perhaps thus it is that some come earlier than others, and so the latter escape the wintry winds, the frosts and "The Rev. George Marsh noted the springs of 1849-50-51 were cold and back-In the year 1850 the beginning of May ward. was so severe and frosty (which it generally is). that a great number of swallows died of starvation, it being too cold for the insects to leave their retreats: 100 being picked up by the mill at Chippenham, and several were found dead on the edge of Draycot pond," where, doubtless, the poor birds had resorted, as they often do, for the purpose of feeding on the gnats and other insects that frequent such places at these times; often they seek the most sheltered situations, as marshes and willowy dells, wherever the same insects are to be found, be they on the sides ones" in the nest slowly starve to death, and he with the gun goes in again, well pleased with what he has done, and eats his dinner: while there lie the dead, they that have wearily come thousands of miles to their loved home, thinking, if they do think, to rest and go again, with their family. Never! they, the weary, are at rest—dead; and the little ones starving.

How cheering is the sweet twittering song of the swallow in the early morn, as he sits on the chimneytop singing to his mate brooding over her eggs in their nest on the brick's ledge a little way down, and how different from the other bird's note, the chaffinches' spink! spink! - spink! or the goldfinch, greenfinch, or everywhere chirping sparrow. I have always loved to listen to the swallow's twittering softened melody, and to watch him as he sits, while ever and anon he darts away, with undulatory flights over field and meadow, now and again scarcely a foot above the grass and meadow-flowers, then away skimming over some distant pond, with open beak he takes in myriads of insects, some of, if not most of which he brings home to her, his nest mate, for I have seen both swallows and martins feed the sitting

And when the young are hatched, how careful and unceasing are the parent birds in their nurture, from early morn until sundown; still they fly, to and fro

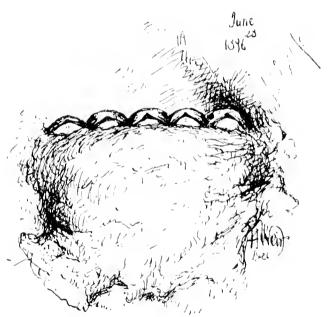

Fig. 67.—Young swallows, as they appeared on june 28, 1896.

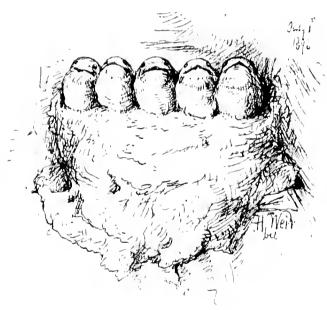

Fig. 68.—Young swallows, as they appeared on july 1, 1896.

look for "the first swallow;" and when seen, how talk of it. And what a truly-beantiful bird it is-how graceful in every line, how its colours flash in the sunlight as it dashes past, itself almost a thing of light, so quickly it comes and goes. It is here, and it is gone, a fast-diminishing speck, gliding away o'er flower-decked meads, and the dappled hedgerows, in the new-born spring. On, on, he goes, this longcurved winged "thing of beauty," seeking the home not only of last year, but also perhaps of many others - the same chimney, the same rafter, shelf of timber, or some cosy ledge. Where! He knows where! Though he left it months ago, and that in hasty flight, travelled thousands of miles to warmer climes, still, through all the long months of absence, he has never forgotten his English home, and the way to it. And as he flies he feeds, on the ephemerae that so often sorely vex and try the temper of "we" gardening folk. As he comes, while he stays, as he goes, he is doing us a natural insect-destroying service. A bird of "all good" and no harm-absolately none. No wonder, then, we look for the coming of the swallows, the martins, and the swifts.

of the rivers, already beautiful and gay with Bluebells, or among the nodding Daffodils, unharmed in such retreats. For these are they

"That come before the swallow dares."

But if the weather is fair, and the spring-tide is but like a foretaste of summer, and the soft west wind dallies about the budding trees and hedgerows, the days and nights being mostly free from frosts, then all goes well with the almost out-wearied traveller who finds his home—and "rest."

But it is not always peace then for the new-come beauty from other and more sunny skies. No! nor even though he has young to tend, nourish, and rear; for there are those that, because this beautiful loveable creature is swift of flight, is agile on the wing, take a gun and go outside, standing, perhaps, on the very door-step of their houses to shoot, to main, and to kill these "beauties," these beloved birds, flying to and fro about their young-filled nests. Yes! to shoot at and try to kill these not only harmless but highly serviceable birds. What for! Why, for "practice," practice and "sport." And so the "little

bringing myriads of insect life, day by day. A short time since, while staying at a country-house, where there were numbers of swallows' nests under a shedroof, on ledges within 10 feet from the ground, I noted that as soon as the young could, they placed themselves in a row with their beaks just showing above the rim of the nest, as in fig. 67, and it was remarkable to observe how each took his or her turn in the feeding. Then a couple of days after they perched on the side, see fig. 68, and with the same fairness in feeding, long after they were apparently well-fledged; there they sat, until one day the old bird took them away somewhere-far away, and left them, and came back for further incubation. Then again away, and this time not to return, but to gather for a long journey, and then to come again next spring. When the weather is unfavourable, such as prolonged and heavy raius, then it is the young die in their nests, for there is, unfortunately, no help for it, for no food can be got, for insects fly not at such times, and so they die forsaken, and mostly these nests are not occupied again another vear.

BOTANICAL SECTION OF THE BRITISH ASSOCIATION.

At the opening meeting held on September 17, the President of this section, Dr. D. H. Scott, M.A., F.R S., Honorary Keeper of the Jodrell Laboratory, Royal Gardens, Kew, limited the scope of his address to modern morphological botany, which he described as the accurate comparison of plants, both living and extinct, with the object of tracing their real relationships with one another, and thus of ultimately constructing a genealogical tree of the vegetable kingdom.

The problem presented, he said, is a purely historical one, and is perfectly distinct from any of the questions with which physiology has to do. Yet there is a close relation between these two branches of biology; at any rate, to those who maintain the Darwinian position. For from that point of view we see that all the characters which the morphologist has to compare are, or have been, adaptive. Hence, it is impossible for the morphologist to ignore the functions of those organs of which he is studying the homologies. There is no essential difference between adaptive and morphological characters, but the physiologist is interested in the question how organs work: the morphologist asks, What is their history? The origin of the great groups of plants is perhaps an insoluble problem, for all that can be directly observed or experimented upon is the occurrence of variations. Such investigations can but throw a sidelight on the historical question of the origin of the existing orders of living things, and the morphologist must use other methods of research. The embryological method has scarcely received justice from botanists. The law of recapitulation (or repetition of phylogeny in ontogeny) has been very inadequately tested in the vegetable kingdom. Whatever its value may be, it is certainly desirable that the development of plants as well as animals should be considered from this point of view; and this has so far been done in very few cases. So far, at least, embryological research has only yielded certain proof of recapitulation in a few instances. Comparative work, in so far as it is limited to plants now living, can never yield certain results. To determine the blood relationships of organisms, their past history must be deciphered, and paleontology alone can supply real historical facts.

ANATOMICAL CHARACTERS.

In judging of the affinities of fossil plants, vegetative characters must be made use of, and especially characters drawn from anatomical structure. In many specimens the anatomical features are the only ones known, and in cases where the reproductive structures have been discovered, the conclusions drawn from anatomical characters have been confirmed. The study of fossil botany is thus likely to call attention to points of structure formerly passed over. Anatomical characters are being made use of in the classification of the higher plants, and thus an effort is being made to place the classification on a broader basis. Anatomical characters are undeniably adaptive, but it is a mistake to suppose that they are necessarily the expression of recent adaptations; on the contrary, there are examples of marked anatomical peculiarities which have become the common property of large groups of plants. A given anatomical character may be of a high degree of constancy in one group, while extremely variable in another, and characters are often most constant when most adaptive.

HISTOLOGY.

Minute histology is a subject lying on the borderland between morphology and physiology. The questions of the present day may be of as much importance in the history of botany as the discovery of the nucleus. The centrosomes, those mysterious protoplasmic particles, supposed to determine the plane of segmentation of the nucleus, if really permanent organs of the cell, must rank as co-equal with the nucleus itself. If they are not constant morphological entities, but temporary structures, do the causes of nuclear division lie in the nucleus itself, or in the surrounding protoplasm? The detailed agreement in the structure and behaviour of the nucleus in the higher plants and the higher animals is most remarkable. Is this striking agreement the product of inheritance from common ancestors, or is the parallelism dependent solely on similar physical conditions in the cells?

ALTERNATION OF GENERATIONS.

It has been known ever since the great discoveries of Hofmeister that the development of a large part of the vegetable kingdom involves a regular alternation of two distinct generations, the one, which is sexual, being constantly succeeded—so far as the normal cycle is concerned—by the other, which is asexual. This alternation is most marked in the mosses and Ferns, taking these words in their widest sense. Now as regards this life-cycle, which is characteristic of all plants higher than Algæ and fungi, there are two great questions at present open. The one is general. Are the two generations, the sporophyte and the oöphyte, homologous with one another, or is the sporophyte a new formation intercalated in the life-history, and not comparable to the sexual plant? The former kind of alternation has been called homologous, the latter antithetic. This question involves the origin of alternation; its solution would help us to bridge over the gap between the Archegoniate and the lower plants. The second problem is more special - has the sporophyte of the Pteridophyta, which always appears as a complete plant, been derived from the simple and totally different sporophyte of the Bryophyta, or are the two of distinct origin! At present it is usual, at any rate in England, to assume the antithetic theory of alternation. On this view the sporophyte first appeared as a mere group of spoors formed by the division of the fertilised ovum. Consequently the inference is drawn that all the vegetative parts of the sporophyte have arisen by the "sterilisation of potentially sporogenous That is to say, there was nothing but a mass of spores to start with, so whatever other tissues and organs the sporophyte may form must be derived from the conversion of spore-forming cells into vegetative cells. The assumption on which the theory rests need not necessarily be accepted. There is another view for which much is to be said -namely, the theory of Pringsheim, according to which the two generations are homologous one with another, the oophyte corresponding to a sexual individual among Thallophytes, the sporophyte to an asexual individual. Pringsheim says: - "The alternation of generations in mosses is immediately related to those phenomena of the succession of free generations in Thallophytes, of which the one represents the neutral, the other the sexual plant." He illustrates this by saying-"The moss sporogonium stands in about the same relation to the moss plant as the sporangium-bearing specimens of Saprolegnia stand to those which bear obgonia, or as, among the Floridex, the specimens with tetraspores are related to those with cystocarps." This gets rid of the intercalation of a new generation altogether; the modification of the already existing sexual and asexual forms of the Thallophytes is only required. The sudden appearance of something completely new in the life history, as required by the antithetic theory, has a certain improbability. Nature is conservative, and when a new organ is to be formed, it is almost always fashioned out of some pre-existing organ. Hence I feel a certain difficulty in accepting the doctrine of the appearance of an intercalated sporophyte by a kind of special creation.

Mosses and Ferns and Fossil Botany.

In discussing the relation between Mosses and Ferns, Dr. Scott said that few people realise how insoluble the problem is; but, without being a partisan for the homologous theory, he protested against the dogmatic statement that alternation of generations must have been the result of the interpolation of a new stage in the life-history. In the presence of the greatest mystery in the morphology of plants, all ought to keep an open mind, and not tie themselves down to assumptions, though they might use them as working hypotheses. The President next discussed the histological characters of the

two generations and the sexuality of fungi, and then dealt with the evidence of descent derived from fossil botany. It has revealed the existence in the carboniferous epoch of a fourth phylum of vascular Cryptogams, quite distinct from the three which have come down to our own day. The keenest interest now centres in the Ferns and Fern-like plants of the carboniferous epoch. No fossil remains of plants are more abundant or more familiar to collectors. In certain cases the whole Fern plant can be built up. Finally, he referred to the Cycad-like fossils which are a striking feature of mesozoic rocks. In conclusion, Dr. Scott remarked on the wonderful fascination of the records of the far-distant past, in which our own origin, like that of our distant cousins the plants, lies hidden. If any fact is brought home to us by the investigations of modern biology, it is the conviction that all life is one; that, as Nageli said, the distance from man to the lowest bacterium is less than the distance from the lowest bacterium to non-living matter. The problems of descent, though strictly speaking they may often prove insoluble, will never lose their attraction for the scientifically-guided imagination.

Professor Vines, in proposing a vote of thanks to Dr. Scott, remarked that the discourse was of special value to teachers, who find great difficulty in keeping themselves informed of the advances made in the many and various branches of botany. Dr. Scott had touched upon many points of importance, and indicated the present state of knowledge of those subjects. He believed that the public usually made the mistake of supposing that botany is a single science. On the contrary, it is an aggregate of sciences, each of which it is impossible for one man to fully pursue.

The vote of thanks was seconded by Professor Bower, and carried with acclamation.

OTHER SUBJECTS.

Professor P. Magnus, of the University of Berlin, read a paper on Some Species of the Chytridiaceous genus Urophlyctis, sketches and specimens of which were handed round for inspection.

In the unavoidable absence of the author, Mr. W. G. P. Ellis, M.A., of Cambridge, a paper on "A Parasitic Disease of Pellia epiphylla" was read by Mr. A. C. Seward, M.A. Mr. Ellis's paper, which was illustrated with lantern-slides, dealt with a disease extending over a pan of Pellia epiphylla at the University Botanic Garden, Cambridge, during May and June, 1896, and caused by a mould allied to, if not identical with, Ascotricha, which has become endoparasitic. The fungus was isolated, cultivated in hanging drops, gelatine tubes and flasks; and conidia from a pure culture when applied to fresh Pellia plants reproduced the disease.

Mr. Vaughan Jennings, Demonstrator of Botany and Geology in the Royal College of Science, Dublin, gave an account of Corallorhiza innata and its associated fungi, illustrated by large diagrams. Mr. Jennings also exhibited diagrams of a new genus of Schizomycetes, which he believed to be reproduced by longitudinal fission instead of by transverse fission, as is usually the case in the Schizomycetes.

Professor Hartog and Professor Marshall Ward disagreed with Mr. Jennings' views, the former suggesting that it was quite possibly a case of dichotomous branching.

THE ASCENT OF WATER IN TREES.

On the occasion of the meeting of the Botanical section on Friday, September 18, after short addresses by Mr. D. T. Gwynne-Yaughan and Mr. G. F. Scott Elliot, Mr. F. Darwin read an elaborate paper on the Ascent of Water in Trees. The two questions to be considered, he said, were—(1) What is the path of the ascending water? (2) What are the forces which produce the rise? As a result of Strasburger's experiments on stems, in which the tissue has been previously killed, it may be concluded that the ascent of water is due entirely to physical causes. The leading idea of botanists who have worked on Strasburger's lines has been that the raising of water to the tops of trees depends on the quality which water possesses of resisting tonsile stress. Experiments have proved

that the amount of tension which water will bear is equal to about seven atmospheres. If, therefore, the leaves at the top of a tall tree can exert the requisite upward pull on the water in the trunk, it seems certain that the pull can be transmitted to tho level of the ground. This opens up the question whether the leaves can exert this traction on the water in the tracheal, and whether there are any factors in the problem incompatible with this theory. The conclusions now adopted are that the sun's heat canses the evaporation of the water with which the walls of the mesophyll cells are imbibed; this water is replaced by imbibition from the cell sap. The concentration of the cell sap so produced maintains the osmotic force of the cell, which again exerts suction on the water on the tracheals. The question of the resistance to the flow of the transpiration current is in want of further investigation. The theory now being considered requires that there shall be continuous columns of water from leaf to root. This is a violent disturbance of current views, since it has been insisted by Sachs and others that at the time of most active transpiration the vessels contain air and not water. Strasburger has concluded that approximate continuity of water-columns is a condition of primary importance, and has made out the cognate fact that the whole of the alburnum need not be simultaneously occupied by a transpiration current; parts of it may be so occupied while parts of it are filled with air, and do not function as waterways. Strasburger states that he has seen water ereep past the air-bubbles in coniferous tracheids. It may be concluded, generally, that the tracheals in their youngest condition may contain water in continuous columns, since the cambium cells from which they arise certainly contain fluid, though it is known also that this condition is not absolutely maintained. It must therefore be believed that either the transpiration current is able to travel past the air-bubbles, or that tracheals partly filled with air may again become continuous waterways by solution of the air

Professor Vines said that the problem of the ascent of water in trees still remained unsolved after 200 years of research. The subject now to be studied was the suction force of the branches. He observed when experimenting with a living branch that it was capable of developing suction force. He removed all the leaves and then found it still capable of producing tension. He concluded that the trunk and branch of the tree must be studied apart from the leaves, and then afterwards the effect of the leaves in conjunction with the stem must be considered. He inferred that the development of suction force was not dependent on the living protoplasm of the branch, since a specimen poisoned with copper subsulphate ean still produce the action. In this case there can be no osmosis. His latest experiments had been with dry sticks of Hazel not poisoned. These can develop a suction force of nearly a quarter of an atmosphere. Since the question of life and osmosis was eliminated, he supposed that the problem was purely a physical one. The physical constants of dead-wood must be known without taking into account the question of osmosis.

Mr. Jolly, speaking on behalf of his colleague, Mr. Dixon, as well as himself, described experiments which they had performed to determine the osmotic power in stems. It had been doubted whether the suction force was sufficient to overcome the resistance. They found that a plant enclosed in an airtight vessel could be subjected to a pressure of 16 atmospheres of carbon dioxide and 26 atmospheres of air before the leaves began to crumple.

Professor Fitzgerald expressed his satisfaction that physicists, botanists, and chemists were at length obliged to meet on a common plane. He believed that one of the great difficulties of botanists in accepting the idea of the tensile property of water was due to the incorrect ideas prevaleut as to the difference between solids and liquids. A liquid was not a substance which could be easily pulled apart, while a solid resisted the action; but in a liquid the particles readily slid over one another, while in a solid they did not.

On the motion of Professor Marshall Ward, a special vote of thanks was given to Mr. F. Dorwin, which was extended by the President, Dr. Scott, to all who had contributed to the discussion.

(To be continued).

THE VEGETABLE PRODUCTS OF NAPLES.

In a report on the trade of the consular district of Naples, Mr. E. Neville-Rolfe gives some interesting notes on the Orange and Lemon groves, from which the following facts are gathered. When an Orangegrove is planted, wild trees are put in, and grafted in the usual way. They grow with bare trunks to 4 or 5 feet from the ground, and then the branches run out and form the fruit-bearing portion of the tree. In this grove an innovation has been introduced which is as ingenious as it is beautiful. Lemons are grafted upon the bare and non-productive stems of the Oranges, about 2 feet from the ground, and twined in garlands from tree to tree, thus not only increasing the productiveness of the grove very materially, but adding greatly to the picturesqueness of its appearance. Orange-trees being usually planted in rows at a measured distance apart, a grove has always a geometrical appearance, which is unsatisfactory; but this appearance is very much modified by the Lemons, which break the lines in all directions. There is a legend, which most people firmly believe, that the grafting of a second fruit on the parent-stem materially alters the type and quality, not only of the original fruit, but also of the graft, and it is sometimes gravely asserted that Blood Oranges are obtained by grafting the Pomegranate on to the Orange. This is a complete fallacy. Both fruits retain their original quality, and neither borrows anything from the other. There is thus no difference between the Lemons grown in the Orange-grove from those grown in the grove where Lemons alone are cultivated.

The Orange-trees produce about 10,000 Oranges annually. The varieties of the Orange grown are the Seville for the making of marmalade, and Blood and Vanille for the table. These are sent to the Naples market and exported—mainly to Hull.

The Lemon-trees flower three times a year, and produce an average crop of 30,000 Lemons, which are exported in cases to Hull, London and America. The trees are all trained on an arbour-trellis, and are protected in the winter by screens made of straw against the possibility of frost. The packing, both of Oranges and Lemons, is done by women, each fruit being rolled separately in tissue paper. The Torrentine women have a special reputation as packers, and go about in gangs in the neighbourhood during the season.

The grove of Mandarius consists of standards trimmed to a round shape like umbrellas. These bear a fine fruit, unusually large of its kind, and form a valuable article of export. The annual yield is about 30,000. The Citrons grow a very large fruit, weighing from 3 to 4 lb. each. Their rind is used for making candied-peel. These trees produce about 2,000 fruits annually, which are sold to grocers at from 50 cents. to 1 frane apiece. Limes, which are also grown, are reserved for home consumption.

The plantations of other fruit-trees are all carefully pruned, as in France, and not allowed to run wild, as is the custom in some parts of Italy. The Fig crops come in the spring and autumn, and the Figs of Posilipo have a well-deserved reputation for their excellence. The variety known in England as the Isshian, or Black Ischian, is here known as the Trojan, showing probably that in remote times it came to these shores from Asia Minor. In order to hasten the ripening of the fruit for the market by ten or twelve days, the top of it is touched with cotton-wool dipped in Olive-oil.

Apricots, Peaches, Nectarines, Plums of all kinds, Olives, Cherries, Raspberries, Mulberries, Loquats, Cape Gooseberries, Prickly Pear, Strawberries, and many other fruits grow in great profusion, and are of excellent quality. The Strawberries are not in great

variety, those most used being the indigenous wild mountain Strawberry, which when cultivated, grows to a good size, and has an exquisite flavour. Besides these fruits, there is the "Percuochi," a kind of hard Peach unknown in Eugland, but larger than the largest Peach, and something in taste between a Peach and a Nectarine, although in colour it more nearly re-embles an Apricot. Both summer and winter varieties of Pears do well, but Apples do not give an abundant crop, though what there is of them is excellent. The Apples grown on the Torrento Mountains, not twenty miles off, are firstrate eating, unrivalled for keeping, and the trees are extremely productive. Sixty large Walnuttrees produce abundant crops, chiefly exported to America. The Sorbe, or Service-tree (Pyrus Sorbus) The fruits are gathered in is largely grown. September, tied up in buuches, hung to an outside wall to ripen, and are ready for the table at Christmas. The Mulberry grove produces about 30 quintals (10,050 lb.) of leaves for feeding silkworms, and these are reared in a large house built expressly for the purpose, which will provide for the hatching of ten ounces of eggs, producing many thousands of worms. The eggs are hatched by an incubator. The walls of the silkworm-house are covered with climbing Roses, Jasmine, and other flowers, which give food to a dozen hives of highly-productive bees, the best kinds of which are the Ligarian.

Obituary.

SIR JOHN ERICHSEN.—This distinguished surgeon died on Wednesday, the 23rd inst., at Folkestone, from a paralytic seizure. Sir John Erichsen was born in 1818, and notwithstanding his father was a Copenhagen merchant, Sir John was brought up in England, and became a student at the University College, London. The deceased was the author of many books upon surgery and physiology. He was made a baronet early in 1895, was the senior Surgeon-Extraordinary to the Queen, and had been President of University College, London, since 1887.

PROFESSOR KING. - Professor James J. F. King, Glasgow, died on Monday, 21st inst., at the Gordon Arms Hotel, Fochabers. He went to Fochabers on Monday, 14th inst., to attend the annual Conference of the Cryptogamic Society of Scotland, of which he was Treasurer. On the Tuesday he accompanied the members in a long outing in search of fungi, and in the evening was present at their meeting in the hotel, and attended to the business of the society. He retired for the night, not feeling very well, and next day he decided to stay in bed. He gradually got weaker, and until Saturday was attended by some of the medical members of the Cryptogamic Society. Dr. Gage, Aberdeen, left the hotel on Saturday, believing that if the professor continued to improve, as he was then doing, he would be able to leave for the south in a few days. On Sunday, however, a change for the worse was noticed. Dr. Hitchcock, Fochabers, was called in, and at once pronounced the case hopeless. The deceased gentleman was Professor of Botany in Anderson's Medical College, Glasgow, and a lecturer in the Glasgow and West of Scotland Technical College, and the Veterinary College. He was sixty-two years of age. Needless to add, the sudden death of the genial doctor has given intense pain to the members of the Cryptogamic Society, of which body he was a most enthusiastic

FRIEDRICH A. H. GIREOUD.—This emicent and much respected Berlin gardener died on Angust 26, 1896, at the age of seventy-five years. He came of French parents domiciled in Berlin, and the greater portion of his life was spent in Germany, beginning his career as gardener in the royal gardens at Saus Souei, near Potsdam. After serving in various places he came to England in 1851, and obtained a post in Kew Gardens, visiting, as occasion offered, some of the best plant-growing places at that time in this country, including Mrs. Lawrence's at Ealing, Chats-

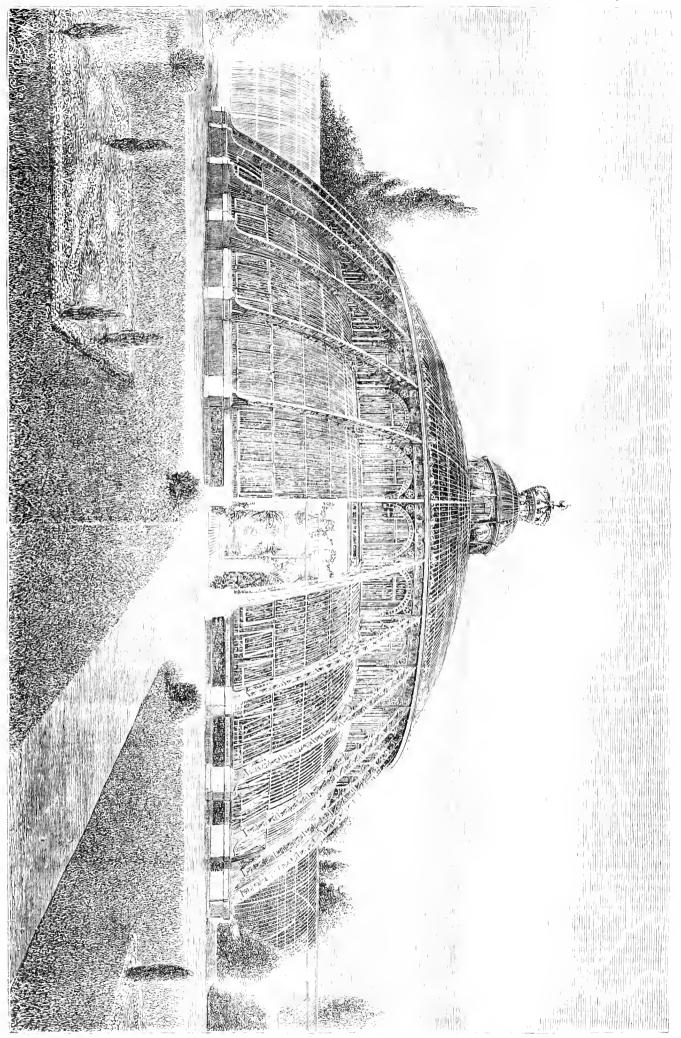

FIG. 69.—THY GREAT CONSERVATORY IN THE ROTAL GARDENS, LAEKEN. (SEE P. 377.)

worth Messrs. J. Veitch & Sons, and others. In 1862, Gircoul became head-gardener to the Duke of Sagan, at Sagan, whose extensive gardens offered him a wide field in which to display his abilities. In 1868, he became garden-inspector, and later dural garden-director. He was the recipient of various medals, received in 1889 the patent as royal Ockonomierath, and the French Good Service Order for agriculture and horticulture.

HENRY KNIGHT.-Mr. Henry Knight, whose death, we announced in our last issue, was not, as some have supposed, a Scotchman, but was born at Taunton on December 14, 1831, and therefore at the time of his death was in his sixty-second year. At the the age of fifteen he lost his father, and having to oh tain employment, was for three or four years afterwards in Messrs. Veitch & Son's seedshop, at their Exeter nurseries. He then west to the gardens at Dalkeith Palace, then nuder the charge of Charles Macintosh, in the year 1853, where although we find his name on the garden books as a journeyman, it was probable that he was really an improver. Those who knew him at that time say he was a "nice, quiet, wellbe-haved lad," and he hore the same excellent reputation till the end of his services at Dalkeith in 1859. In the meantime Maciotosh had retired, and was succeeded, in 1855, by W. Thomson, by whom Knight was ultimately raised to the post of senior foreman under glass with the charge of the fruits, serving in that capacity for several years. On one occasion the Countess of Pavia called during the summer season at Dalkeith, and was shown over the gardens, and being favourably impressed with what she saw in the way of fruit culture, and in the general appearance of the place, requested Mr. Thomson to select for her a gardener who would be likely to carry out gardening operations in the same excellent style at her place, Câhteau Pontehartrain, Seine et Oise, in France. Without hesitation, he recommended Mr. Knight, who ling the year 1859 or 1860 entered the Countess' service as head gardener. There he remained eight years, and carried out a great deal of heavy and expensive work in remodelling the gardens, constructing lakes, roads, &c., and erecting a considerable number of glass structures. He much astonished the Parisians with the size and quality of the Grapes he grew at Pontchartrain; and in 1866 he sent some to a meeting of the Royal Horticultural Society, which are said to have greatly astonished the leading Grape growers of that day in this country. Mr. Knight's name also appears in the list of exhibitors at the great International Horticultural Exhibition held in London in that year. He remained at Pontchartrain eight years, and in 1867 he was appointed gardener to the Duke of Roxburgh, at Floors Castle, Roxburghshire. Being desirous of becoming acquainted with horticulture as pursued in the South of England, he left Floors on the death of the Duke, and because head gardener to the late Right Hon. W. H. Smith, M.P., Greenlands, Henley-on-Thames. Here he remained for four years, resigning his situation as a consequence of disagreement with the estate agent; and when His Majesty the King of the Belgians required a Superintendent of the Royal pirks and gardens at Laeken, Mr. Knight was recommended by Dr. M. T. Masters, the editor of the Gardeners' Chronicle, who was thanked by the King himself for having done so, who likewise informed him that the Duchess of Roxburgh, then one of the Ladies-iu waiting to Her Majesty the Queen, confirmed Dr. Masters' statements, The Duchess' connection with the English Court may afford a reason for the statement we have seen that it was on the Queen's recommendation that Knight was appointed.

The Royal demesne and château of Lucken are distant about 2 miles from Brussels, and rank as regards the beautiful park and gardensamong the finest in Europe. The conservatory (fig. 69, p. 376) is of enormous dimensions, although the effect of the building as a whole is somewhat marred by the unnecessary massiveness of the iron-work. Knight, however, was not responsible for that, the design and the materials being supplied by Belgiaus. Many new glasshouses

were erected, and others rebuilt according to modern ideas, and the gardens greatly aftered and improved during the past twelve years.

Mr. Knight enjoyed the confidence and esteem of the King, and he was highly respected by the members of the Belgian royal family. Only last year, on returning home after a visit to the King of the Belgians, the Duke of Westminster wrote to Mr. Knight expressing his congratulations at the splendid order and artistic appearance of the gardens under his charge. Mr. Knight had been ill for about six weeks previous to his death. He leaves a family of six, three sons and three dughters, two of whom, a son and a daughter, are settled in Australia, and two are nonvirsed, and reside at Laeken. The eldest son, James Knight, is engage l in farming in Australia; the second is in the banking business; and the youngest, Thomas, is being brought up to the gardening profession at Messrs. B. S. Williams & Son's, Upper Holloway, London, N. Mr. Knight was a mau of marked ability; he was fully conversant with the French language, and his

THE LAIR HENRY KNIGHT

geniality made him a great favourite with all. The funeral took place at Laeken on Saturday, September 12, and was attended by a large concourse of mourners, the funeral procession to the cemetery numbering 400 persons, His Majesty the King of the Belgians being represented by Baron de Goffinet, Colonel Equerry to His Majesty; the King also sent a magnificent wreath of Orchids, the centre of which was composed of Cattleya Leopold II., grown by Mr. Knight. Amongst others present were Count de Kerchove de Denterghem, Sir Francis Plunkett, G.C.M.G.; M. Boxtal, Burgomaster of Laeken; Baron Wyckerslooth, and Messis, J. Linden, C. Murray, Rodegas, Dr. Thomson, and others, besides the entire personnel of the Royal Gardens and Parks. It may be mentioned that Mr. Knight was for many years a valued correspondent of this journal, at first over the signature of "Chevalier," and latterly over those of "H, K.," and "K."

ORCHID NOTES AND GLEANINGS.

ONCIDIUM HEMATOCHILUM.

This is one of the handsomest of the Lanceanum section of Oncidiums. True it is only about half the size of O. Lanceanum, but it throws a handsome

raceme with a large number of flowers, and the spikes vary from 2 to 3 feet in length. We have known the species for years, but it is by no means plentiful; and it was a pleasure to note a plant of it in that varied collection of Orchids formed by E. Ashworth, Esq., Harefield Hall, Wilmslow (Mr. Holbrook, gardener), The plant had two racemes, one bearing eighteen and the other thirteen flowers. The colouration and, indeed, fornation of both sepals and petals are alike. the ground-colour being pinkish yellow, with crowds of Indian red blotches, which is so characteristic of Lanceanum. The lip has two stiff-looking wings, all but sessile, and the unprotected column rests on a circular knob immediately above the wings; the lower portion expands from a linear line to a considerable circular blade with similar ground colour to the segment, only the blotching is more pronounced.

EPIDENDRUM GODSEFFIANUM.

This is one of the atro-purpureum section of Epideadrums which is worthy of cultivation, as it is essentially distinct from many of its compeers. The flower-spike is showy, the one in question in the Harefield House collection bearing eighteen flowers, and the individual flowers take the eye being of good form. The sepals and petals are ovate, clumping well together, having a sienna ground, the ciunamon colour shining through; and the margin forms a fine decided line of old gold colour. The upper lobes of the lip are pinkish-white, while the lower obcordate blade has whitish ground with prominent purple lines. It was growing in the Cypripedium-house, which seems a good one for these West Iudian Epidendrums.

DENDROBIUM HOOKERIANUM.

This is a distinct species, and a welcome one flowering, as it does, at this season of the year. It has the yellow colour of D. Brymerianum, and a little of the fringed lip of that delightful Orchid. It seems to be a lanky grower, after the way of D. triadenum, but is much less robust in habit, and throws its short spikes of flowers towards the extremity of the pseudo-bulb. Its flowers are large, measuring about $4\frac{1}{2}$ in. across. The sepals are broadly linear, acuminate, and turned back at the edges until nearing the point; the petals are of much the same formation, but more inclined to be ovate, and the colour of the whole of the segments is yellow. The lip is circular, springing from a convolute base, completely concealing the column, and is in colour similar to the segments, with the very prominent fringe, above alluded to; the two eyes at the base are of deep maroon, with an orange blotch above them, leaving a broad band of yellow running right up to the base of the column.

DENDROBIUM DEAREI.

This is one of the most desirable, and undoubtedly the most lasting of all the white Dendrobes. Mr. Ashworth has always grown and shown this well, and the fact of one of the plants that came nuder my eye being at the Manchester Whitsuntide Exhibition, and is still in flower, shows how persistent are the blooms. We all admire the species because of its evergreen habit, the pale-greed ovate leaves, forming a grand setting for the crowd of flowers that come in various numbers towards the extremity. The flowers, too, are exquisitely white, of as good formation, too, as D. Phalænopsis, and the greenish lines running together at the upper blade of the labellum adds to its attraction. Mr. Ashworth's gardener has the plants in various houses, but it appears to be most at home in a brisk East Indian temperature, and appears to like limited rooting-space and moisture at the

ZYGOPETALUM MAXILLARE GAUTIERII.

The fine plant which we noticed at p. 95, col. c., grown by Geo. Shorland Bull, Esq., Ashford (gr., Mr. Hay), is now in full flower. It has thirty-six of its grand violet and white blended flowers fully expanded, and is quite a refreshing sight among other flowering Orchids. The robust character of its leaves, and shining distended pseudo-bulbs, command attention, springing as they do from a Tree-Fernstem. J. A.

VEGETABLES.

TURNIPS WHITE AND YELLOW, NEW AND OLD.

Your notice of the new Milan Turnip yielding bulbs 7 inches in circumference within a month of sowing, wakes up old practitioners accustomed to the slower pace of the White Stone, White Dutch, or Yellow Maltese. We carefully note that soil, site, and season were forcing-the former rich, the locality warm (near Exeter), and the season included between July and August 29. Still, edible Turnips obtained in one month from time of sowing was worthy of the record you gave of the Early Milau on p. 297, and will cause it to be very generally enquired for-Turnips, like Radishes, can hardly be tee quickly The Early Strap-leaf, White Stone and Extraearly Paris Market, a Carrot-shaped variety, have proved the earliest in my past experience; but obviously the Extra-early Milan is a dead beat to these in regard to time. The Red Globe Turnip is not especially early, but it is admirable as a main, reliable cropper, remains long in season, and proves reliable and good for autumn sowing.

Messrs. Dobbie and other nurserymen offer very special selections of White Model and Golden Ball Turnips of fine form and size for garden purposes. but it seems as if no one cares to grow white Turnips in Scotland. Out of eighteen dishes shown at the recent meeting of the Royal Caledonian Horticultural Society there was only one dish of white Turnips shown, all the others being Golden Balls, as like each other as two peas in a pod. This is the more extraordinary, as in many families in England neither French ner English cooks will use yellow-fleshed Turnips. And I think it will generally be admitted that other conditions of soil, climate and culture being equal, white Turnips are milder and sweeter than the yellow; and in Turnips yellow colour can bring ne advantage, for white Turnips, skilfully cooked and served, are more like whipped cream than those of any other colour.

Perhaps some of our friends who still are, and perhaps always have been, north of the Tweed, will tell us through the tiardeners' Chronicle why they nearly all grow Yellow or Golden Ball Turnips! and while they are among our garden roots, why they all grow Carret-rooted instead of globular or Turniprooted Beets! the finer strains of Turnip-rooted or Egyptian Deet being earlier, better, morenutty-flavoured than the longer-rooted varieties. And yet, at the show already referred to, there were twenty four lots of Carrot-reoted, and not one Egyptian. These differences in regard to the form and colour of popular vegetables are so pronounced as to excite notice and invite explanation. One more and I have done, why is the Red Globe Onion more popular in Scotland than in England. D. T. F.

SOCIETIES.

HOVE HORTICULTURAL AND INDUS-TRIAL EXHIBITION.

SEPTEMBER 16, 17.- The nineteenth annual exhibition of this flourishing society was held at the Hove Town Hall on the above dates.

For a collection of four dishes of fruit, Mr. H. HARRIS, gr., Denne Park, Horsham, was 1st with Barrington Peaches, Pitmaston Orange Necturines, Royal Favourite Melon, and

Pitmuston Orange Necturines, Royal Favourite Melon, and Black Hamburgh Grapes, good berries but lacking colour; 2md, Mr W. E. Anderson, gr. to S. Cowett, Esq., Preston, who had good Hamburgh Grapes, Royal George Peaches, Louise Bonne of Jersey Pears, and Brown Turkey Figs. Collection of Apples, consisting of six varieties, Mr. Garrac was 1st with Peasgood's Nonsuch, Warner's King, The Que u, Worcester Pearmain, Lord Lemox, and Duchess of Oldenberg; 2nd, Mr. Harars, with Lord Suffield, Emperor Alexander, Blemheim Orange, Worcester Pearmain, &c. In the special Grape classes the chief prize-takers were Mr. Say, Anderson, Lawrance, and G. House.

Pol too, iv varieties, were well shown by Mr. J. Pearl, gr. to R. Bevas, Esq., Withdean, who was 1st, with King of the Russets, Magnum Bonam, Sapreme, Satisfaction, Showdron, and Reading Hero; and Mr. F. Rapley, gr. to Miss Visick, St. John's, Prest op, was 2nd.

Vegetables were excellently shown by Mr. E. LAWBANCE and Mr. RAPLEY

Cottagers exhibits were less numerous than usual, and scarcely so good as in some previous years.

ROYAL SCOTTISH ARBORICULTURAL.

SEPTEMBER 19.—On Saturday this society had the privilege of visiting Arniston, Garebridge, Midlothiam, the splendid domain of Dundas, Esq., who, in the most courteous manner, received the visitors (chiefly from Edinburgh and the southern parts of Seotland), and the delight of the foresters rea hed the maximum pitch when Mr. Dundas produced maps showing the gradual but great changes made on the forests, while degree described the maximum pitch when Mr. Dundas produced maps park, and grounds since they were laid out in the old formal style with consummate care in 1600. Capability Brown (among other great landscape gardeners) applied his skill on the spacious area of woods, reducing much of the formality, and introducing a wide result of the space. and introducing a style more in barmony with modern taste, but enough is left to show the gigantic scale on which the but enough is left to show the gigantic scale on which the planting was first done; the long avenues of gigantic Limes, Planes, Beeches, and other forest trees, show that great labour must have been expended, and the interest in forest planting maintained for many generations. The present proprietor (so highly esteemed for the benefits rendered in various directions to the county) has nobly done his part towards the maintenance of ornancial and comparable fraction. The foresting fit with done his part towards the maintenance of ornamental and commercial forestry. The formation of the ground, with deep ravines, streams of water, a d cascades, seen throughout the domain, is most suitable for testing the growth, hardness, and general suitability of trees and shrabs for ornamental planting. A grand batch of specimen Larches are growing on the tanks; no disease or stunting being observed on these steep declivities; there are also many thright this condensate for the tanks. stunting being observed on these steep declivities; there are also many thriving Oaks, and among some fice Ash trees noticed is one lung spreading tree that measures 15 feet in girth 4 feet up the bole, and 16 feet at 2 feet from the ground; this tree is about 250 years old. A grand Sycamore, with wide-spreading head, is 164 feet in girth of bole. A stunted Oak, but also of good size, is 300 years old; and another is nearly 400 years old. Growing in poor soil is a fine Oak, and the oldest on the place, whose girth is 10 feet.

Passing along one of the avenues, chiefly consisting of large Lime-trees, mixed with Oak, Elm, Beech, and Ash, we came to a plantation of Scots Fir, very handsome trees, with clean, straight stems, 47 to 60 feet high, and averaging 10½ feet in circumference of stem. Others were noted of grander proportions, with stems 60 to 70 feet in height, and 112 feet to the tops of the crowns. Some wonderful Larches, with stems tops of the crowns. Some wonderful Larches, with stems 80 feet high, and free from branches; and grand Sweet Chestnuts, with stems 10 feet and 11 feet in girth were noted. Passing on towards the spacious and imposiog mansion, fine old Yews were remarked, interspersed with Beeches, Sweet Chestnuts, and some other timber trees, giving this part of the grounds an antique appearance. Many grand Larches stand near to these, and one which measures 111 feet to the top, with 65 feet of clean stem, and a girth (4 feet up) of 16 feet, is a magnificent specimen. An Italian Black Poplar, 90 feet high, growing beside two small Oaks planted at the same time, shows how well adapted to the position is the first-named as compared with the latter. A beautiful glade consists of Sequoia gigantea, Abies Doughasii, and Picca nobilis shows trees in fine vigour. A plantation of Spruce Firs standing at wide distances rigour. A plantation of Spruce Firs standing at wide distances apart, have an attractive appearance with branches drouping trowards the ground. These were said to have been selected trees from the nursery-beds, and they are now 12) feet or trees from the nursery-beds, and they are now 120 feet or more in beight, and furnished with branches to the ground. Some fine Douglas Firs are over 100 feet high, and 74 feet in girth at 4 feet up the stem. A number of rustic, byy-covered bridges thrown across a brook connect the ornamental with the commercial woods; and hereabouts some fine specimen Picca nobilis, 40 feet high, planted thirteen years ago, are in full vigour, and of remarkable beauty. There is much in the gardens worthy of note, through which we were conducted by the agent for the estate; and Mr. McTaggart, the head-gardener, gave us useful information in regard to his treatment of the Apricots under glass This fruit, along with Plums, does splendidly on the back walls of the glasshouses. The Moor Park is the favounte variety. Apricots are grown also on a south wall, with uniform success. Many of the Peach-trees observed under glass are of great age, but they produce fine fruits in abundance. Passing along the spacious vegetable garden, crops of every sort seemed of remarkable goodness. The Apple erop is a good one, and many fruits were being housed. Muscat of Alexandria and Lady Downe's Grapes were remarked in the vineries, the latter especially being in fine

The company were entertained in Mr. Dundys' diningroom to a substantial tea, the thanks of the visitors being afterwards expressed by Mr. M. Dunn, of Dalkeith.

VARIORUM.

THE man who thinks all the time and never acts is a stick-he is too sleepy to succeed. The man who acts all the time and never thinks is a plodder-he does what others tell him, but does nothing that he tells himself. The successful man not only thinks all the time, but backs up his thinking with acting all the time. Minneapolis Bulletin.

MARKETS.

COVENT GARDEN, SEPTEMBER 24.

[We cannot accept any responsibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindeess of several of the principal salesmen, who revise the list, and who are responsible for the quotations. It must be remembered that these quotations do not represent the prices on any particular day, but only the general averages for the week preceding the date of our report. The prices depend upon the quality of the samples, the supply in the market, and the demand; and they may fluctuate, not only from day to day, but often several times in one day. Ed.

Polatos,					

Polatos,
The market generally is in a very bad state. Owing to the late heavy rains most samples show a large proportion of diseased tubers, and in consequence, exceedingly lew prices have to be taken to realise. Sound tubers still command the prices given in our last report. J. B. Thomas.

SEEDS.

LONDON: September 23.—Messes, John Shaw & Sons, Seed Merchants, of Great Maze Pond, Borough, London, S.E., describe to-day's seed murket as burely attended. Clover-seeds, of all kinds, with bad Home, American, and Continental crop prospects, point to higher values. For Trifolium the demand is about over. Winter Tures keep steady. Rye is advancing. As regards Wisconsin Green Boiling Peas, the upward to require the required is making ranial and subward movement previously noted, is making rapid and sub-stantial progress. Harieots are firm. More money is asked for Lentils. In oatmeal there has been a most remarkable rise. As regards Canary seed, the undertone daily gains in strength and holders show a bolder front. Hemp-seed tends against buyers.

FRUIT AND VEGETABLES.

LIVERPOOL: September 23.—The following are the average of the prices at market at this date: Potatos, 8d, to 10d, per peck: Cucumbers, 3d, to 6d, each; Damsons, 14d, per pound; Grapes, English, 2s. 6d. to 3s. per pound; do. foreign, 4d. to 8d. do.; Mushrooms, 4d. to 8d. do. The above are the 8t. John's prices—In other markets prices average: Potatos, Main Crops, 2s. 3d. to 3s. 6d. per cwt.; pink cycd Kemps, Main Cropt, 28, 3d. to 3s. 6d. per cwt.; plus cycla Kemps, 2s. to 2s. 6d. do.; Sutton's Abundanee, 1s. 9d. to 2s. 3d. do.; Bruce, 1s. 9d. to 2s. 2d. do.; Turnips, 6d. to 8d. per doz. bunches; do., Sw-des, 1s. to 1s. 2d. per cwt.; Carrots, 6d. to 8d. per doz. bunches, 3s. per cwt.; Onions, English, 5s. to 7s. per cwt.; do., foreign, 3s. do.; Parsley, 4d. to 6d. per doz. bunches; Cucumbers, 1s. to 2s. 6d. per dozen; Cauliflowers, 6d. to 1s. 4d. do.; Cabbages, 6d. to 10d. do.; Celery, 1s. to 2s. 3d. per dozen.

GLASGOW: September 23.—The following are the averages of the prices current at this market during the past week: of the prices current at this market during the past week :—
Fruit:—Pears, 2s. 3d. per case; Apples, 4d. to 6d. per pound;
Green Gagos, 5d. to 6d. do.; Tomatos, Guernsey, 4d. to 5d.
do.; do., Scotch, 7d. to 9d. do.; Plums, 3dd. to 4d. do.;
Grapes, home, 2s. do. **Pegetables:—Turnips, yellow 2s. to
2s. 6d. per dozen bunches; Cabibages, 8d. to 9d. per dozen;
do., Red, 2s. 6d. to 3s. do.; Cauliflowers, English, 2s. to 2s. 6d.
do.; do., Edinburgh, 1s. to 1s. 3d. per bunch; Parsnips, 5s. 6d.
do.; do., Eder, Herbs, assorted, 1d. to 2d. per bunch; Locks,
2s. to 2s. 6d. per doz. bunches; Mint, 6d. per bunch; Onions,
Dutch, 3s. 6d. to 4s. 6d. per bug; do., Portugal, 10d. per
stone; do., Globe, 3s. to 3s. 6d. per cwt.; Parsley, ss. to 19s.
do.; Celery, table, 2s. to 2s. 6d. per bunde; Potatos, 3d. per stone; do., Globe, 5s. to 2s. 6d. per bundle; Potatos, 8d. per stone; Carrots, 4s. 6d. to 5s. per ewt.; do., new, 1s. to 1s. 6d. per dozen; Cucumbers, 4s. per dozen; Letnees, 6d. to 8d. per dozen; do., Cos, 9d. per dozen; Radishes, 9d. to 1s. per dozen bunches; Hors radish, 2s. 9d. Radishes, 9d. to 1s. per dozen bunches; Horszadish, 2s. 9d. to 3s. per bunch; Beans, broid, 1s. to 1s. 3d. per stone; do. French, 2s. to 2s. 6d. do.; Mushrooms, 1s. to 1s. 3d. per lb.; Rhubarb, natural, 2s. 6d. to 3s. per cwt.; Beetroot, 7d. per dozen; do., new, 3s. 6d. to 4s. per dozen bunches; Cross. 3d. per basket; Brussels Sprouts, 2s. 6 l. per stone.

[The term "accumulated temperature" indicates the aggregate amount, as well as the duration, of degrees of temperature above or below 42° Fahr, for the period named: and this combined result is expressed in Daydegrees—a "Day-degree" signifying 1° continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:—

0, Scotland, N. Principal Wheat-producing Districts—
1, Scotland, E.; 2, England, N.E.; 3, England, E.;
4, Midland Counties; 5, England, including London, N. Principal Grazing, &c., Districts—6, Scotland, W;
7, England, N.W.; 8, England, S.W.; 9, Ireland, N.;
10, Ireland, S.; *Channel Islands.

THE PAST WEEK.

THE following summary record of the weather throughout the British Islands for the week ending September 19, is

furnished from the Meteorological Office:—
"The weather during this period continued unsettled and rainy very generally, with thunder and lightning at times in nearly all districts. During the carlier days of the week the rain was heaviest at the southern stations, but later on it became heaviest in the north and north-west. "The temperature was slightly above the mean in most

districts, but just equalled it in the north and east of Scotdistricts, but just equalled it in the north and east of Scotland, and the north of Ireland. The highest of the maxima were recorded during the early purt of the week, and ranged from 70° in 'England, E.,' and 60° in the 'Channel Islands,' 'Eugland, S.,' and the 'Midland Counties,' to 64° in 'Scotland, E.,' and to 62° in 'Scotland, W.' The lowest of the minima, which were registered on the 19th, varied from 30° over 'Scotland, N. and E.,' and the 'Midland Counties,' to 45° in 'England, E. and N.W.,' and to 52° in the 'Channel Islands.' Islands.

"The rainfall again exceeded the mean in nearly all disricts, the excess being very large in 'Scotland, N,' and very considerable in all the western districts. In 'Eogland, N.E. and E.,' however, there was a slight deficit.

"The bright sunshine was again very deficient over nearly the whole of England, but was rather in excess of the normal

over our north-eastern counties. Ireland, and the greater part of Scotland. The percentage of the possible duration ranged from 43 in 'Ireland, S.,' 38 in the 'Channel Islands' and 'England, E.,' and 37 to 36 over our north-eastern districts, to 31 in 'Ireland, N.,' 26 in 'Scotland, N.,' and 23 in 'England N.W.'? England, N.W.

NATIONAL CHRYSANTHEMUM SOCIETY .- 1 meeting of the Floral Committee took place on September 24, and but very few exhibits of Chrysanthemums were forthcoming, Dahlias preponderating. A First class Certificate of Merit was awarded to an early-flowering Chrysanthemum named Barbara Forbes, a large white incurved Japanese, with a delicate sulphur-coloured centre; like Anna Hartshorn in character, but from three weeks to a month earlier, in height about 4 feet, from Mr. W. J. Godfrey, nurseryman, Exmouth. From Mr. J. ARNOLD, florist, Stoke, Devonport, came some very pretty Caetus Dahlias, but unfortunately not in the best condition, the blooms being past their best; John Arnold, a pretty pink variety; Ludy Lyou-, pure white; and Star of Devon, bright crimson, are so promising, that it is a pity they were not seen in better condition. Mr. J. Green, Norfolk Nurseries, Dereham, sent a number of blooms of his new Caetus Dahlia, Aurora, which has already received several Certificates of Merit, but which was not seen at its best on this occasion. It has a bushy habit, grows to the height of 3½ feet, flowers stand well above the foliage, and is singularly free, thirty to forty expanded flowers being cut from a plant at one and the same time. Mr. GREEN also sent a bloom each of some seedling Cactus Dahlias, one, an apricot-coloured variety, was very distinct; and a crimson flower of the Matchless type was also very promising. Votes of Thanks were passed to each exhibitor.

APPLE: J. D. A. We do not know of any Apple similar to the one you send us. We are unable to endorse all you say about its goodness. We cannot trace any resemblance whitever either in appearance or in quality to Cox's Orange Pippin. It is certainly a very late Apple, instead of being a month earlier than Cox's; the flesh is hard, dry and sweetish. In our opinion, it is almost as regards quality, third-rate. The name and address of the Secretary of the Royal Horticultural Society is as follows: The Rev. W. Wilks, 117, Victoria Street, Westminster.

Arboriculture: Arboriculturist. There is a Scottish society. You should make an application to the Director of the Royal Botanic Gardens, Elinburgh. A government School of Forestry exists at Cooper's Hill, Englefield Green, Staines, which of course holds examinations, and awards certificates of

BOOKS: E. F. Schlich's Manual of Forestry, 5 vols. up to the present time Bradbury, Aguew & Co.).— Hartig's Diseases of Trees, translated by Somerville and Marshall Ward (Macmillan & Co.) .- Timber, and some of its Diseases, H. Marshall Ward (Macmillan & Co.).—Veitch's Manual of Conferous Plants, by J. Veitch & Sons, Royal Exotic Nursery, Chelsea.—The Forester, by Brown & Nisbet, new edition (Blackwood & Sons).—J. C. Elementary Chemistry. Which branch of this wide subject do you require information upon!

Examination in Horticulture: J. E. W. If you make application to the Secretary of the Royal Horticultural Society, Rev. W. Wilks, stating your wish to be examined, you will be furnished with all necessary information regarding the subjects, time, place, &c.

FORTY-EIGHT SPECIES AND VARIETIES OF HERBACEOUS PLANTS: A Constant Subscriber. Peruse our Flower-garden Calender in the present issue; or get some trade grower to give you a list.

GARDENIA ROOTS: R. W. Dean. The roots sent are very badly infested with eel-worm, for which there is no remdy. Dig up the plants and burn them, and char the soil in which they are growing. The cel-worms have probably been introduced with the pasture loam.

GRAPES: R. G. S. From the specimen sent it is evident that the Vines have been seriously neglected. and it would be the best policy to make new borders and plant afresh. The white Grape is one of the American varieties so distasteful to English palates by reason of the pronounced "musky" flavour they possess. The black variety is one of average merit; but we prefer not to name such uncharacteristic berries. The foliage is enveloped with redspider and other pests.

Insects: T. G. The larvæ of Tipula oleracea. Dig the ground frequently, and expose the caterpillars to the birds. It is difficult to kill them by other means.

JUMPING BEANS: W. T. The seeds are those of a Peruvian plant whose native name is Colliguaja, and the larvae therein contained is that of an insect belonging to Tortricidea (Carpocapsa saltitans). For full description and figures, see *Gardeners' Chronivle*, 1859, p. 909, and December 22, 1894, p. 761.

* The application to aime flowers, and especially fruits, are so aumerius at this season, as secrely to the nar resources. They ented an expenditure of time, below, and money, of which nar reduces how little that. We are willing to oblige our correspondents as five as we can, but we must request that they will observe the rade that not more than six varieties be sent at any one time. The specimens should be good ones, just approaching expenses, and to proved disappointment, they should be properly another typically packed. We do not underly to to aid answers through the post. D lay in any case of unremainful.

Names of Plants: Correspondents not answered in this issue are requested to be so good as to consult the following number.—T. W. R. 1, 2, 3, Crategus eoccinea; 1, 5, C. mollis both N. American).—Quereus. 1, Quercus Turneri; 2, Q. Toza.—W. C. 1, no fruits, cannot name from leaves only; 2, Crategus nollis; 3, C. coccinea; 4, Pyrus Aria; 5, P. A. variety; 6, P. A. flabelliformis; 7, Crategus oxyacantha variety of).— H. Cattleya Warscewiczii, a species which, crossed with C. Dowiana aurea, produced C. × Hardyana, a flower very different from the one that you sent.—.1. F Genista tinctoria; not poisonous to cows, but is said to give a bitter taste to their milk, and the said to give a bitter taste to their milk, and the cheese made from it. — E. F. Chrysauthenium Parthenium var. discoideum.—W. e. Salvia splendens.—F. G. S. The best form of Odontoglossum Bictoniense album.—J. W. Cypripedium Spicerianum.—W. J. P., Frendem. 1, Odontoglossum grande; 2, Corcopsis tinctoria; 3, Funkii alborascipata, t. Hudder, an uipas, a faces was as marginata; 4, Heuchera sanguinea, so far as we can tell without seeing flowers; 5, Funkia grandiflora. -G. P. Chlorophyton Sterubergianum.—Reader.

1, Maranta (Makoyana): propagate by division: 2, Streptocarpus hybrid : propagate by leaf-cuttings

NATURAL ORDEES: A. M. B. Davidsonia pruriens (Saxifrageæ), Cardwellia sublimis (Proteaccæ), Asterolasia Muolleri (Rutaceæ).

ORCHID UNHEALTHY: J. B. It may be a case of what is somewhat vaguely called Orchid disease, and which is very liable to attack Cattleya Warscewiczii and C. Dowiana anrea; or, it is possible that your plant has been situated where the direct heat from the hot-water pipes, or the draught from a ventilator or door reaches it?

PTEROCARYA CAUCASICA: *II. May.* In the southern districts of England this plant fruits with considerable freedom. Such au occurrence may te rare in county Sligo, but we have seen it in fruit in other parts of Ireland. The plant does remarkably well at Fota.

RAMONDIA: W. W. The cause of the discoloration and shrivelling of the leaves of Ramondia is not to be found in the plants themselves. There is no appearance, and no trace of fungus disease, not even of Bacteriosis. In one plant there is a white sapro-Thyte upon the dead tissues, but it can have nothing to do with the disease. The cause will have to be sought in external surroundings. Some such results might be produced by imperfect drainage. M. C. C.

Refuse from Papermill: Gardener. As affording lime and potash to the soil, the substance would certainly have its advantages if used as a top dressing, stirred into the surface with a hoe. Two to three cwt. to the acre would suffice at any one time.

Tomato Crop on a Single Plant: R. G. A tall well-grown plant under glass will produce from 15 to 20 lb. of fruit, and an out-of-doors plant 5 to 6 lb. These are merely approximate figures, so much depending on soil-culture, variety, and the time when the seed was sown.

TOMATO PLANTS WITH ABNORMAL LEAVES: W. L. Y. No trace of fungus in the foliage of Tomatos to account for the abnormal development discovered; and it would seem that an arrest of growth has taken place, due probably to the cool conditions of weather.

Users of the Divining Rod: J. C. We are unable to give you the addresses of these persons. You should use our advertising columns.

TESTIMONIAL.

From W. H. WHITTAKER, Gardener to Sir Hickman B. Bacon, Bart., Thonock, Gainsborough.

"I am truly pleased to add another to your list of testimonials, as your Fumigator is undoubledly the best I have ever u ed. I find it certain death to all insect pests, whilst the most tender foliage is not hurt in the least. When I took charge here, the Peach house was in full bloom, and was infested with bith scale and ily. As you remember, I wrote, asking if you considered it afte to fumigate under the circumstances. I followed your advice, and the result was surprising; after once fumigating, the fly was all dead, and most of the scale. I told this to a neighbouring gardener, who, out of curiosity, came to witness my second application, which was in the evening; next morning, we found all the scale, old and young alike, "quite dead." My friend, like myself, was delighted. I gave him circulars, which he took to his employer. Mr Pearson Morton House, Gainsbrough, whom I understand obtained a No. 2 Set, which has given every satisfaction. After using your Fumigator, one feels he cannot praise it too much." praise it too much.

To be had from a'l Nurserymen, Seedsmen, Florists, and Sundriesmen; or, direct from the Sole Proprietor,

On view morning of Sale, and Catalogues had.

FRIDAY, OCTOBER 9, 1896.

ENORMOUS SALE OF 20,000 ORCHIDS,

ABSOLUTELY WITHOUT RESERVE.

THE VERY GRANDEST KNOWN TYPES

7.000 DENDROBIUM PHALÆNOPSIS SCHRODERIANUM.

THE GLORY OF THE EAST.

In simply Perfect Condition; they will bear Flowers ou their present growths in November and December, and on their new growths about April or May,

WE QUARANTEE THEM THE BEST AND FINEST LOT IN EVERY WAY EVER IMPORTING

3,000 ODONTOGLOSSUM CRISPUM (True Pacho Type),

THE QUEEN OF THE WESTERN CORDILLERAS.

We absolutely warrant them the finest type; these we know are the true Pacho, round, perfect kind, that cannot be equalled by any other form of the species. They are Sander's genuine, unapproachable and perfect Pacho type, unequalled for size of flower, substance, quality and perfection of form.

Grand varieties have emanated from our former importations. These now offered are most distinct looking in every way, and we can most strongly recomm-ud and thoroughly guarantee them, the finest and best procurable.

A Consignment of L.ELIA ANCEPS,

Sent as GRAND WHITE. The original Dawsonii type, with broad rhomboid segments of a dazzling white, found only in that variety.

SCHOMBURGKIA THOMSONIANA.

Undoubtedly the finest in the genus. Twenty blossoms borne on a spike; flowers like a cream-coloured Lacha purpurata, with a black-maroon lip.

DENDROPHYLAX FAWCETTII.

Offered for the first time. Flowers snow-white, resembling Angrecum Fourgierianum. Grows and Flowers without Leaves.

NEW SOBRALIAS. Rare and Lovely kinds.

LÆLIA PURPUPATA.

Exceptionally splendid Piauts with huge bulbs, plump eyes; most distinct looking and beautful specimens are among

CATTLEYA, Intermedia and Varieties.

A most distinct and diverse looking lot, many having the appearance of Ledia elegans. These and the Ledia purpurata were found growing together in company with Cattleya Leopoldii.

VANDA CERULEA in Flower or Bud, Boxes of miscellaueous Orchids, etc., etc.

MESSRS. PROTHEROE AND MORRIS have PESSENS, FROUTERING AND MORKIS BAYE received instructions from Messrs F, Sandera & Co., St. Albans, to SELL the foregoing in their Central Auction Rooms, 67 and 68, Cheapside, London, E.C., ABSOLUTELY WITHOUT RESERVE, on FRIDAY, OCTOBER 9th,

Cattleyas not to hand; we hope to make a big Cattleyn Sale on their arrival.
